MPC5606BK Microcontroller Data Sheet

1 Introduction

1.1 Document overview

This document describes the features of the family and options available within the family members, and highlights important electrical and physical characteristics of the device.

1.2 Description

This family of 32-bit system-on-chip (SoC) microcontrollers is the latest achievement in integrated automotive application controllers. It belongs to an expanding family of automotive-focused products designed to address the next wave of body electronics applications within the vehicle.

The advanced and cost-efficient e200z0 host processor core of this automotive controller family complies with the Power Architecture® technology and only implements the VLE (variable-length encoding) APU (Auxiliary Processor Unit), providing improved code density. It operates at speeds of up to 64 MHz and offers high performance processing optimized for low power consumption. It capitalizes on the available development infrastructure of current Power Architecture devices and is supported with software drivers, operating systems and configuration code to assist with users implementations.

1.3 Device comparison

Table 1 summarizes the functions of the blocks present on the MPC5606BK.

Table 1. MPC5606BK family comparison[1]

1 Feature set dependent on selected peripheral multiplexing; table shows example.

2 Based on 125 °C ambient operating temperature.

3 Not shared with 12-bit ADC, but possibly shared with other alternate functions.

4 Not shared with 10-bit ADC, but possibly shared with other alternate functions.

5 Refer to eMIOS section of device reference manual for information on the channel configuration and functions.

6 Each channel supports a range of modes including Modulus counters, PWM generation, Input Capture, Output Compare.

7 Each channel supports a range of modes including PWM generation with dead time, Input Capture, Output Compare.

8 Each channel supports a range of modes including PWM generation, Input Capture, Output Compare, Period and Pulse width measurement.

9 Each channel supports a range of modes including PWM generation, Input Capture, and Output Compare.

10 Maximum I/O count based on multiplexing with peripherals.

2 Package pinouts and signal descriptions

2.1 Package pinouts

The available LQFP pinouts are provided in the following figures. For pin signal descriptions, please see Table 2.

Figure 2 shows the MPC5606BK in the 176 LQFP package.

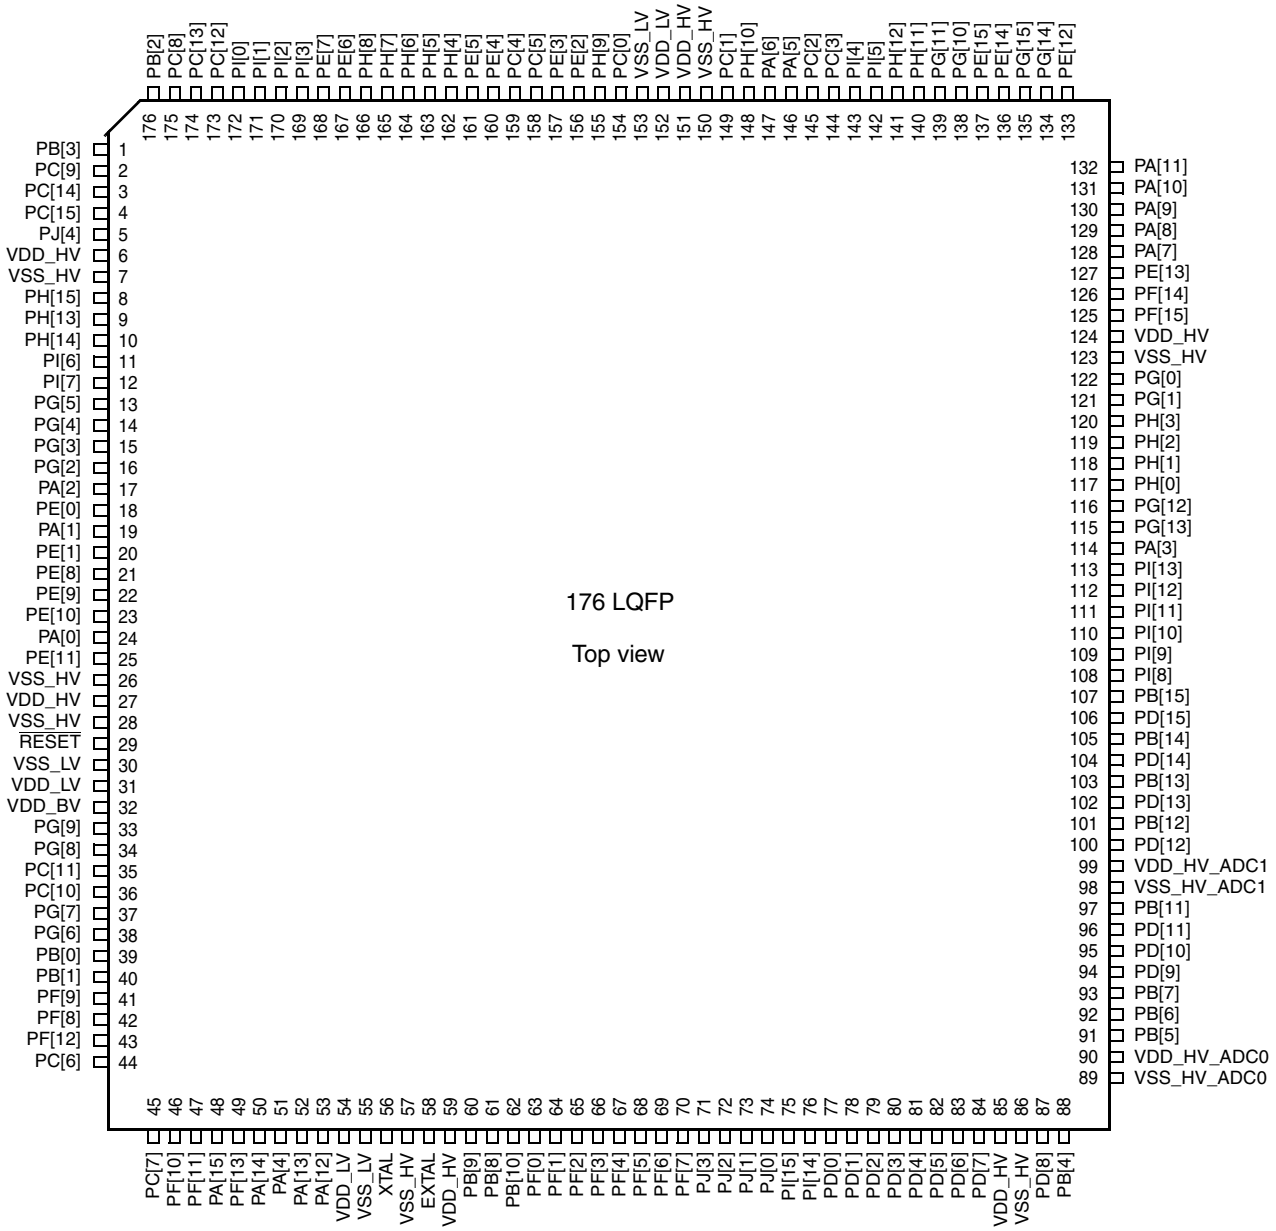

Figure 2. 176 LQFP pinout

Figure 3 shows the MPC5606BK in the 144 LQFP package.

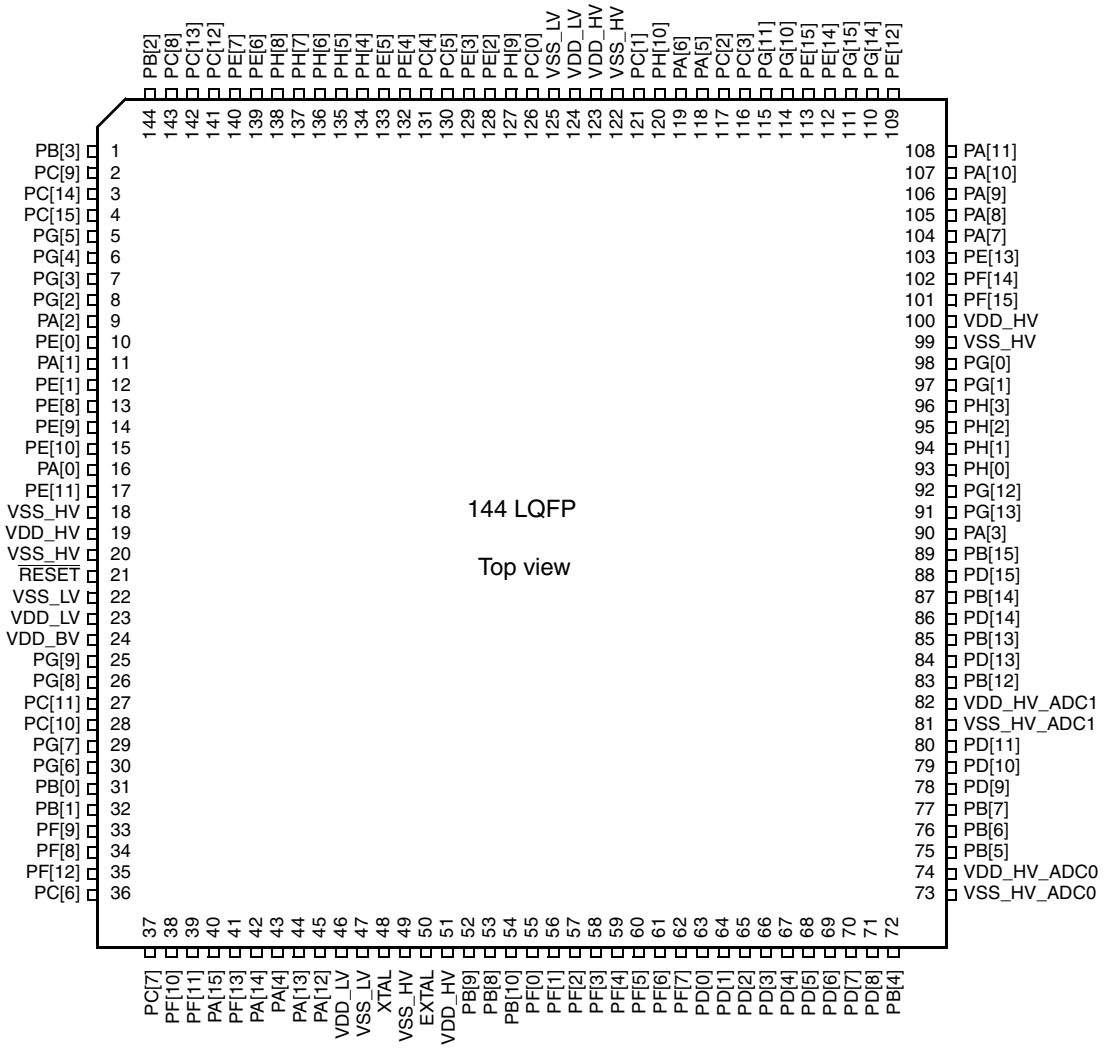

Figure 3. 144 LQFP pinout

Figure 4 shows the MPC5606BK in the 100 LQFP package.

2.2 Pin muxing

Table 2 defines the pin list and muxing for this device.

Each entry of Table 2 shows all the possible configurations for each pin, via the alternate functions. The default function assigned to each pin after reset is indicated by AF0.

1 Alternate functions are chosen by setting the values of the PCR.PA bitfields inside the SIUL module. PCR.PA = 00 → AF0; PCR.PA = 01 → AF1; PCR.PA = 10 → AF2; PCR.PA = 11 → AF3. This is intended to select the output functions; to use one of the input functions, the PCR.IBE bit must be written to '1', regardless of the values selected in the PCR.PA bitfields. For this reason, the value corresponding to an input only function is reported as "—".

2 See Table 3.

3 The RESET configuration applies during and after reset.

[4] All WKUP pins also support external interrupt capability. See the WKPU chapter of the *MPC5606BK Microcontroller Reference Manual* for further details.

[5] NMI has higher priority than alternate function. When NMI is selected, the PCR.AF field is ignored.

[6] "Not applicable" because these functions are available only while the device is booting. See the BAM chapter of the *MPC5606BK Microcontroller Reference Manual* for details.

[7] Value of PCR.IBE bit must be 0.

[8] Out of reset all the functional pins except PC[0:1] and PH[9:10] are available to the user as GPIO.
PC[0:1] are available as JTAG pins (TDI and TDO respectively).
PH[9:10] are available as JTAG pins (TCK and TMS respectively).
It is up to the user to configure these pins as GPIO when needed.

[9] PC[1] is a fast/medium pad but is in medium configuration by default. This pad is in Alternate Function 2 mode after reset which has TDO functionality. The reset value of PCR.OBE is 1, but this setting has no impact as long as this pad stays in AF2 mode. After configuring this pad as GPIO (PCR.PA = 0), output buffer is enabled as reset value of PCR.OBE = 1.

[10] Not available in 100LQFP package.

J	Input/output with analog feature

3 Electrical characteristics

This section contains electrical characteristics of the device as well as temperature and power considerations.

This product contains devices to protect the inputs against damage due to high static voltages. However, it is advisable to take precautions to avoid application of any voltage higher than the specified maximum rated voltages.

To enhance reliability, unused inputs can be driven to an appropriate logic voltage level (V_{DD} or V_{SS}). This could be done by the internal pull-up and pull-down, which is provided by the product for most general purpose pins.

The parameters listed in the following tables represent the characteristics of the device and its demands on the system.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol "CC" for Controller Characteristics is included in the Symbol column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol "SR" for System Requirement is included in the Symbol column.

3.1 Parameter classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the classifications listed in Table 4 are used and the parameters are tagged accordingly in the tables where appropriate.

Table 4. Parameter classifications

Classification tag	Tag description
P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

3.2 NVUSRO register

Portions of the device configuration, such as high voltage supply, oscillator margin, and watchdog enable/disable after reset are controlled via bit values in the Non-Volatile User Options Register (NVUSRO) register.

For a detailed description of the NVUSRO register, please refer to the *MPC5606BK Microcontroller Reference Manual*.

3.2.1 NVUSRO[PAD3V5V] field description

Table 5 shows how NVUSRO[PAD3V5V] controls the device configuration.

Table 5. PAD3V5V field description[1]

Value[2]	Description
0	High voltage supply is 5.0 V
1	High voltage supply is 3.3 V

1 See the *MPC5606BK Microcontroller Reference Manual* for more information on the NVUSRO register.

2 The default manufacturing value is ‘1’. This value can be programmed by the customer in Shadow Flash.

The DC electrical characteristics are dependent on the PAD3V5V bit value.

3.2.2 NVUSRO[OSCILLATOR_MARGIN] field description

Table 6 shows how NVUSRO[OSCILLATOR_MARGIN] controls the device configuration.

Table 6. OSCILLATOR_MARGIN field description[1]

Value[2]	Description
0	Low consumption configuration (4 MHz/8 MHz)
1	High margin configuration (4 MHz/16 MHz)

1 See the *MPC5606BK Microcontroller Reference Manual* for more information on the NVUSRO register.

2 The default manufacturing value is ‘1’. This value can be programmed by the customer in Shadow Flash.

The fast external crystal oscillator consumption is dependent on the OSCILLATOR_MARGIN bit value.

3.2.3 NVUSRO[WATCHDOG_EN] field description

The watchdog enable/disable configuration after reset is dependent on the WATCHDOG_EN bit value. Table 7 shows how NVUSRO[WATCHDOG_EN] controls the device configuration.

Table 7. WATCHDOG_EN field description[1]

Value[2]	Description
0	Disable after reset
1	Enable after reset

1 See the *MPC5606BK Microcontroller Reference Manual* for more information on the NVUSRO register.

2 The default manufacturing value is '1'. This value can be programmed by the customer in Shadow Flash.

3.3 Absolute maximum ratings

$T_{STORAGE}$	SR	Storage temperature	—	–55	150	°C

NOTE

Stresses exceeding the recommended absolute maximum ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During overload conditions ($V_{IN} > V_{DD}$ or $V_{IN} < V_{SS}$), the voltage on pins with respect to ground (V_{SS}) must not exceed the recommended values.

1 100 nF capacitance needs to be provided between each V_{DD}/V_{SS} pair.

2 330 nF capacitance needs to be provided between each V_{DD_LV}/V_{SS_LV} supply pair.

3 470 nF capacitance needs to be provided between V_{DD_BV} and the nearest V_{SS_LV} (higher value may be needed depending on external regulator characteristics). Supply ramp slope on VDD_BV should always be faster or equal to slope of VDD_HV. Otherwise, device may enter regulator bypass mode if slope on VDD_BV is slower.

4 100 nF capacitance needs to be provided between V_{DD_ADC}/V_{SS_ADC} pair.

5 Full electrical specification cannot be guaranteed when voltage drops below 3.0 V. In particular, ADC electrical characteristics and I/O DC electrical specification may not be guaranteed. When voltage drops below V_{LVDHVL}, the device is reset.

6 Guaranteed by device validation

7 Minimum value of TV_{DD} must be guaranteed until V_{DD} reaches 2.6 V (maximum value of V_{PORH}).

8 This frequency includes the 4% frequency modulation guard band.

1 100 nF capacitance needs to be provided between each V_{DD}/V_{SS} pair.

2 Full device operation is guaranteed by design when the voltage drops below 4.5 V down to 3.0 V. However, certain analog electrical characteristics will not be guaranteed to stay within the stated limits.

3 330 nF capacitance needs to be provided between each V_{DD_LV}/V_{SS_LV} supply pair.

4 470 nF capacitance needs to be provided between V_{DD_BV} and the nearest V_{SS_LV} (higher value may be needed depending on external regulator characteristics). While the supply voltage ramps up, the slope on V_{DD_BV} should be less than $0.9V_{DD\_HV}$ in order to ensure the device does not enter regulator bypass mode.

5 100 nF capacitance needs to be provided between V_{DD_ADC}/V_{SS_ADC} pair.

6 Guaranteed by device validation. Please refer to Section 3.5.1, External ballast resistor recommendations for minimum V_{DD} slope to be guaranteed to ensure correct power up in case of external resistor usage.

7 Minimum value of TV_{DD} must be guaranteed until V_{DD} reaches 2.6 V (maximum value of V_{PORH}).

8 This frequency includes the 4% frequency modulation guard band.

NOTE

RAM data retention is guaranteed with V_{DD_LV} not below 1.08 V.

3.5 Thermal characteristics

3.5.1 External ballast resistor recommendations

External ballast resistor on V_{DD_BV} pin helps in reducing the overall power dissipation inside the device. This resistor is required only when maximum power consumption exceeds the limit imposed by package thermal characteristics.

As stated in Table 11 LQFP thermal characteristics, considering a thermal resistance of 144 LQFP as 48.3 °C/W, at ambient temperature T_A = 125 °C, the junction temperature T_j will cross 150 °C if the total power dissipation is greater than (150 – 125)/48.3 = 517 mW. Therefore, the total device current I_{DDMAX} at 125 °C/5.5 V must not exceed 94.1 mA (i.e., PD/VDD). Assuming an average $I_{DD}(V_{DD\_HV})$ of 15–20 mA consumption typically during device RUN mode, the LV domain consumption $I_{DD}(V_{DD\_BV})$ is thus limited to $I_{DDMAX} - I_{DD}(V_{DD\_HV})$, i.e., 80 mA.

Therefore, respecting the maximum power allowed as explained in Section 3.5.2, Package thermal characteristics, it is recommended to use this resistor only in the 125 °C/5.5 V operating corner as per the following guidelines:

- If $I_{DD}(V_{DD\_BV}) < 80$ mA, then no resistor is required.
- If 80 mA < $I_{DD}(V_{DD\_BV}) < 90$ mA, then 4 Ω resistor can be used.
- If $I_{DD}(V_{DD\_BV}) > 90$ mA, then 8 Ω resistor can be used.

Using resistance in the range of 4–8 Ω, the gain will be around 10–20% of total consumption on V_{DD_BV}. For example, if 8 Ω resistor is used, then power consumption when $I_{DD}(V_{DD\_BV})$ is 110 mA is equivalent to power consumption when $I_{DD}(V_{DD\_BV})$ is 90 mA (approximately) when resistor not used.

In order to ensure correct power up, the minimum V_{DD_BV} to be guaranteed is 30 ms/V. If the supply ramp is slower than this value, then LVDHV3B monitoring ballast supply V_{DD_BV} pin gets triggered leading to device reset. Until the supply reaches certain threshold, this low voltage monitor generates destructive reset event in the system. This threshold depends on the maximum $I_{DD}(V_{DD\_BV})$ possible across the external resistor.

1 Thermal characteristics are targets based on simulation.

2 V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C.

3 Junction-to-ambient thermal resistance determined per JEDEC JESD51-3 and JESD51-6. Thermal test board meets JEDEC specification for this package. When Greek letters are not available, the symbols are typed as R_{thJA} and R_{thJMA}.

4 Junction-to-board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package. When Greek letters are not available, the symbols are typed as R_{thJB}.

5 Junction-to-case at the top of the package determined using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer. When Greek letters are not available, the symbols are typed as R_{thJC}.

3.5.3 Power considerations

The average chip-junction temperature, T_J, in degrees Celsius, may be calculated using Equation 1:

$$T_J = T_A + (P_D \times R_{\theta JA}) \quad \textit{Eqn. 1}$$

Where:

T_A is the ambient temperature in °C.

$R_{\theta JA}$ is the package junction-to-ambient thermal resistance, in °C/W.

P_D is the sum of P_{INT} and $P_{I/O}$ ($P_D = P_{INT} + P_{I/O}$).

P_{INT} is the product of I_{DD} and V_{DD}, expressed in watts. This is the chip internal power.

$P_{I/O}$ represents the power dissipation on input and output pins; user determined.

Most of the time for the applications, $P_{I/O} < P_{INT}$ and may be neglected. On the other hand, $P_{I/O}$ may be significant, if the device is configured to continuously drive external modules and/or memories.

An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is given by:

$$P_D = K / (T_J + 273\ °C) \quad \textit{Eqn. 2}$$

Therefore, solving equations 1 and 2:

$$K = P_D \times (T_A + 273\ °C) + R_{\theta JA} \times P_D^2 \quad \textit{Eqn. 3}$$

Where:

K is a constant for the particular part, which may be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J may be obtained by solving equations 1 and 2 iteratively for any value of T_A.

3.6 I/O pad electrical characteristics

3.6.1 I/O pad types

The device provides four main I/O pad types depending on the associated alternate functions:

- Slow pads — are the most common pads, providing a good compromise between transition time and low electromagnetic emission.
- Medium pads — provide transition fast enough for the serial communication channels with controlled current to reduce electromagnetic emission.
- Fast pads — provide maximum speed. These are used for improved debugging capability.
- Input only pads — are associated with ADC channels and 32 kHz low power external crystal oscillator providing low input leakage.

Medium and Fast pads can use slow configuration to reduce electromagnetic emission, at the cost of reducing AC performance.

3.6.2 I/O input DC characteristics

Table 12 provides input DC electrical characteristics as described in Figure 5.

3.6.5 I/O pad current specification

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a V_{DD}/V_{SS} supply pair as described in Table 18.

Table 19 provides I/O consumption figures.

In order to ensure device reliability, the average current of the I/O on a single segment should remain below the I_{AVGSEG} maximum value.

4 The configuration PAD3V5 = 1 when V_{DD} = 5 V is only transient configuration during power-up. All pads but RESET are configured in input or in high impedance state.

3.8 Power management electrical characteristics

3.8.1 Voltage regulator electrical characteristics

The device implements an internal voltage regulator to generate the low voltage core supply V_{DD_LV} from the high voltage ballast supply V_{DD_BV}. The regulator itself is supplied by the common I/O supply V_{DD}. The following supplies are involved:

- HV: High voltage external power supply for voltage regulator module. This must be provided externally through V_{DD} power pin.
- BV: High voltage external power supply for internal ballast module. This must be provided externally through V_{DD_BV} power pin. Voltage values should be aligned with V_{DD}.
- LV: Low voltage internal power supply for core, FMPLL and Flash digital logic. This is generated by the internal voltage regulator but provided outside to connect stability capacitor. It is further split into four main domains to ensure noise isolation between critical LV modules within the device:
  - LV_COR: Low voltage supply for the core. It is also used to provide supply for FMPLL through double bonding.
  - LV_CFLA: Low voltage supply for code Flash module. It is supplied with dedicated ballast and shorted to LV_COR through double bonding.
  - LV_DFLA: Low voltage supply for data Flash module. It is supplied with dedicated ballast and shorted to LV_COR through double bonding.
  - LV_PLL: Low voltage supply for FMPLL. It is shorted to LV_COR through double bonding.

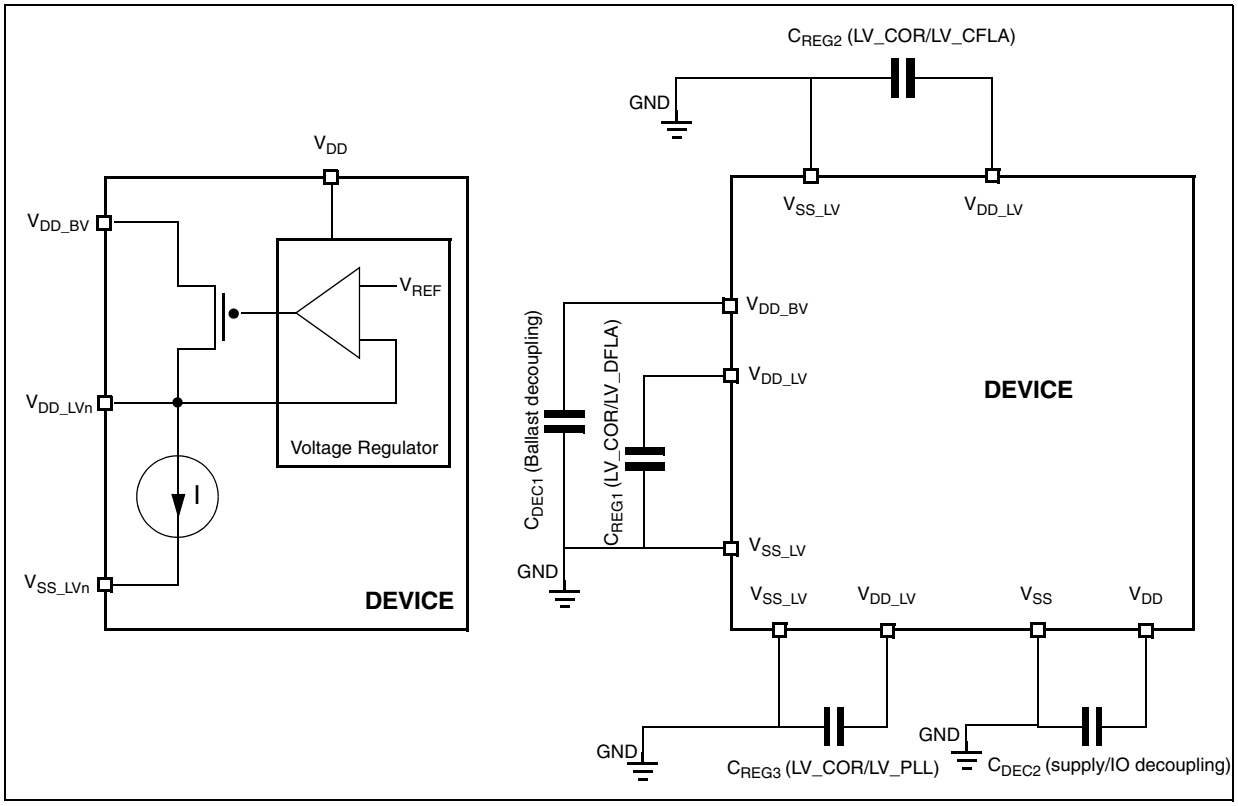

Figure 8. Voltage regulator capacitance connection

The internal voltage regulator requires external capacitance (C_{REGn}) to be connected to the device in order to provide a stable low voltage digital supply to the device. Capacitances should be placed on the board as near as possible to the associated pins. Care should also be taken to limit the serial inductance of the board to less than 5 nH.

Each decoupling capacitor must be placed between each of the three V_{DD_LV}/V_{SS_LV} supply pairs to ensure stable voltage (see Section 3.4, Recommended operating conditions).

The internal voltage regulator requires controlled slew rate of V_{DD}/V_{DD_BV} as described in Figure 9.

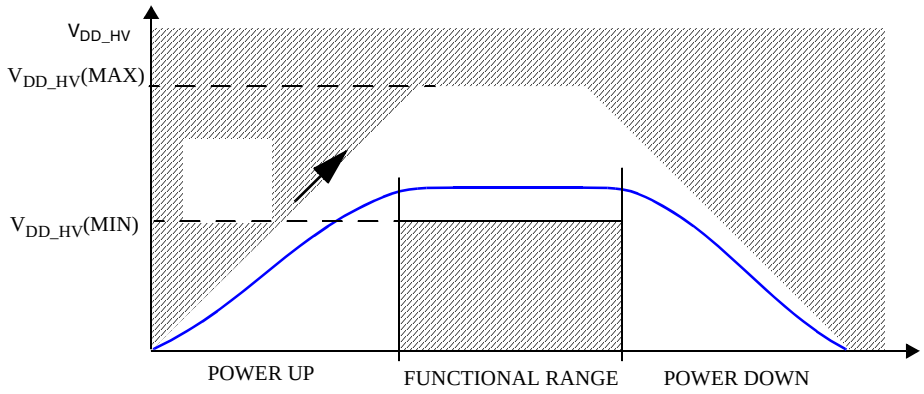

Figure 9. V_{DD} and V_{DD_BV} maximum slope

When STANDBY mode is used, further constraints apply to the V_{DD}/V_{DD_BV} in order to guarantee correct regulator functionality during STANDBY exit. This is described in Figure 10.

STANDBY regulator constraints should normally be guaranteed by implementing equivalent of C_{STDBY} capacitance on application board (capacitance and ESR typical values), but would actually depend on the exact characteristics of the application's external regulator.

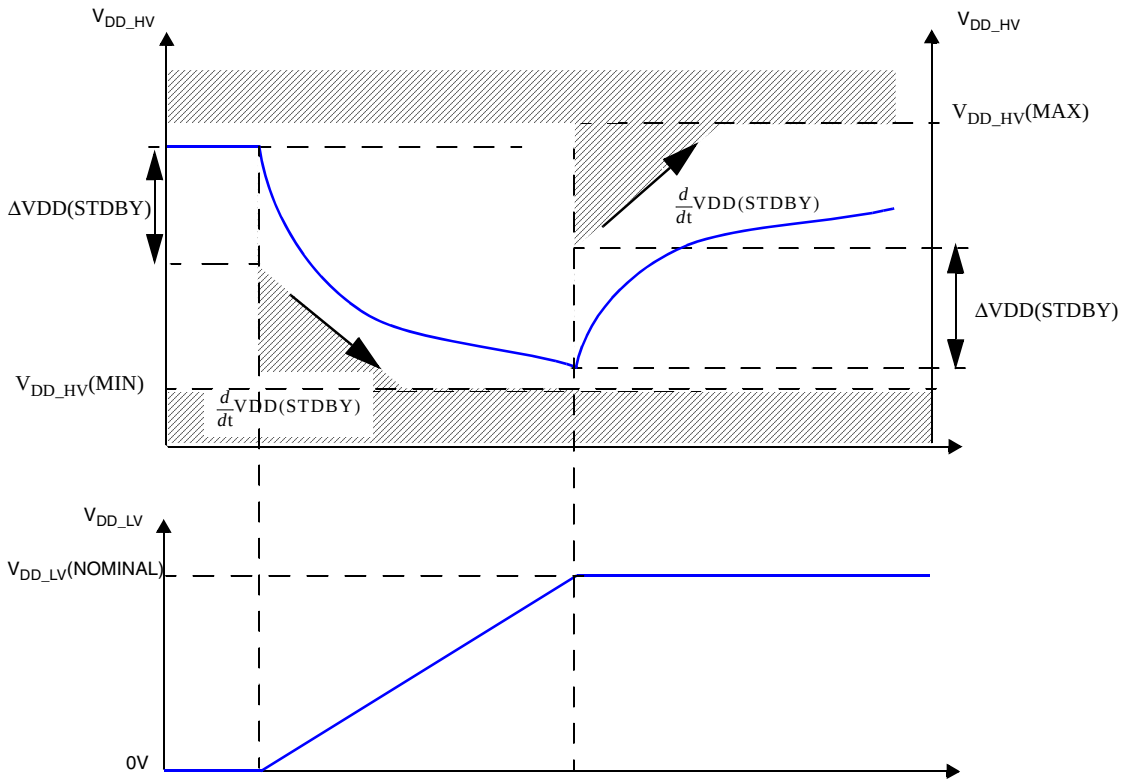

Figure 10. V_{DD} and V_{DD_BV} supply constraints during STANDBY mode exit

1 V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified

2 This capacitance value is driven by the constraints of the external voltage regulator supplying the V_{DD_BV} voltage. A typical value is in the range of 470 nF.

3 This value is acceptable to guarantee operation from 4.5 V to 5.5 V

4 External regulator and capacitance circuitry must be capable of providing I_{DD_BV} while maintaining supply V_{DD_BV} in operating range.

5 Inrush current is seen only for short time during power-up and on standby exit (max 20 µs, depending on external capacitances to be load).

6 The duration of the inrush current depends on the capacitance placed on LV pins. BV decoupling capacitors must be sized accordingly. Refer to I_{MREG} value for minimum amount of current to be provided in cc.

3.8.2 Voltage monitor electrical characteristics

The device implements a Power-on Reset module to ensure correct power-up initialization, as well as four low voltage detectors to monitor the V_{DD} and the V_{DD_LV} voltage while device is supplied:

- POR monitors V_{DD} during the power-up phase to ensure device is maintained in a safe reset state
- LVDHV3 monitors V_{DD} to ensure device reset below minimum functional supply
- LVDHV3B monitors VDD_BV to ensure device reset below minimum functional supply
- LVDHV5 monitors V_{DD} when application uses device in the 5.0 V ± 10% range
- LVDLVCOR monitors power domain No. 1
- LVDLVBKP monitors power domain No. 0

NOTE

When enabled, power domain No. 2 is monitored through LVDLVBKP.

1 Except for I_{DDMAX}, all consumptions in this table apply to V_{DD_BV} only and do not include V_{DD_HV}.

2 V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified

3 Running consumption is given on voltage regulator supply (V_{DDREG}). I_{DDMAX} is composed of three components: $I_{DDMAX} = I_{DD}(V_{DD\_BV}) + I_{DD}(V_{DD\_HV}) + I_{DD}(V_{DD\_HV\_ADC})$. It does not include a fourth component linked to I/Os toggling which is **highly** dependent on the application. The given value is thought to be a **worst case value** (64 MHz at 125 °C) with all peripherals running, and code fetched from code flash while modify operation on-going on data flash. Note that this value can be significantly reduced by the application: switch off unused peripherals (default), reduce peripheral frequency through internal prescaler, fetch from RAM most used functions, use low power mode when possible.

[4] Higher current may be sunk by device during power-up and standby exit. Please refer to inrush current in Table 22.

3.11 Electromagnetic compatibility (EMC) characteristics

Susceptibility tests are performed on a sample basis during product characterization.

3.11.1 Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user apply EMC software optimization and prequalification tests in relation with the EMC level requested for the application.

- Software recommendations – The software flowchart must include the management of runaway conditions such as:
  - — Corrupted program counter
  - — Unexpected reset
  - — Critical data corruption (control registers...)
- Prequalification trials – Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the reset pin or the oscillator pins for 1 second.

  To complete these trials, ESD stress can be applied directly on the device. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring.

3.11.2 Electromagnetic interference (EMI)

The product is monitored in terms of emission based on a typical application. This emission test conforms to the IEC61967-1 standard, which specifies the general conditions for EMI measurements.

3.11.3 Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity.

3.11.3.1 Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts×(n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

1 All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

2 A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

3.11.3.2 Static latch-up (LU)

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with the EIA/JESD 78 IC latch-up standard.

3.17 ADC electrical characteristics

3.17.1 Introduction

The device provides two Successive Approximation Register (SAR) analog-to-digital converters (10-bit and 12-bit).

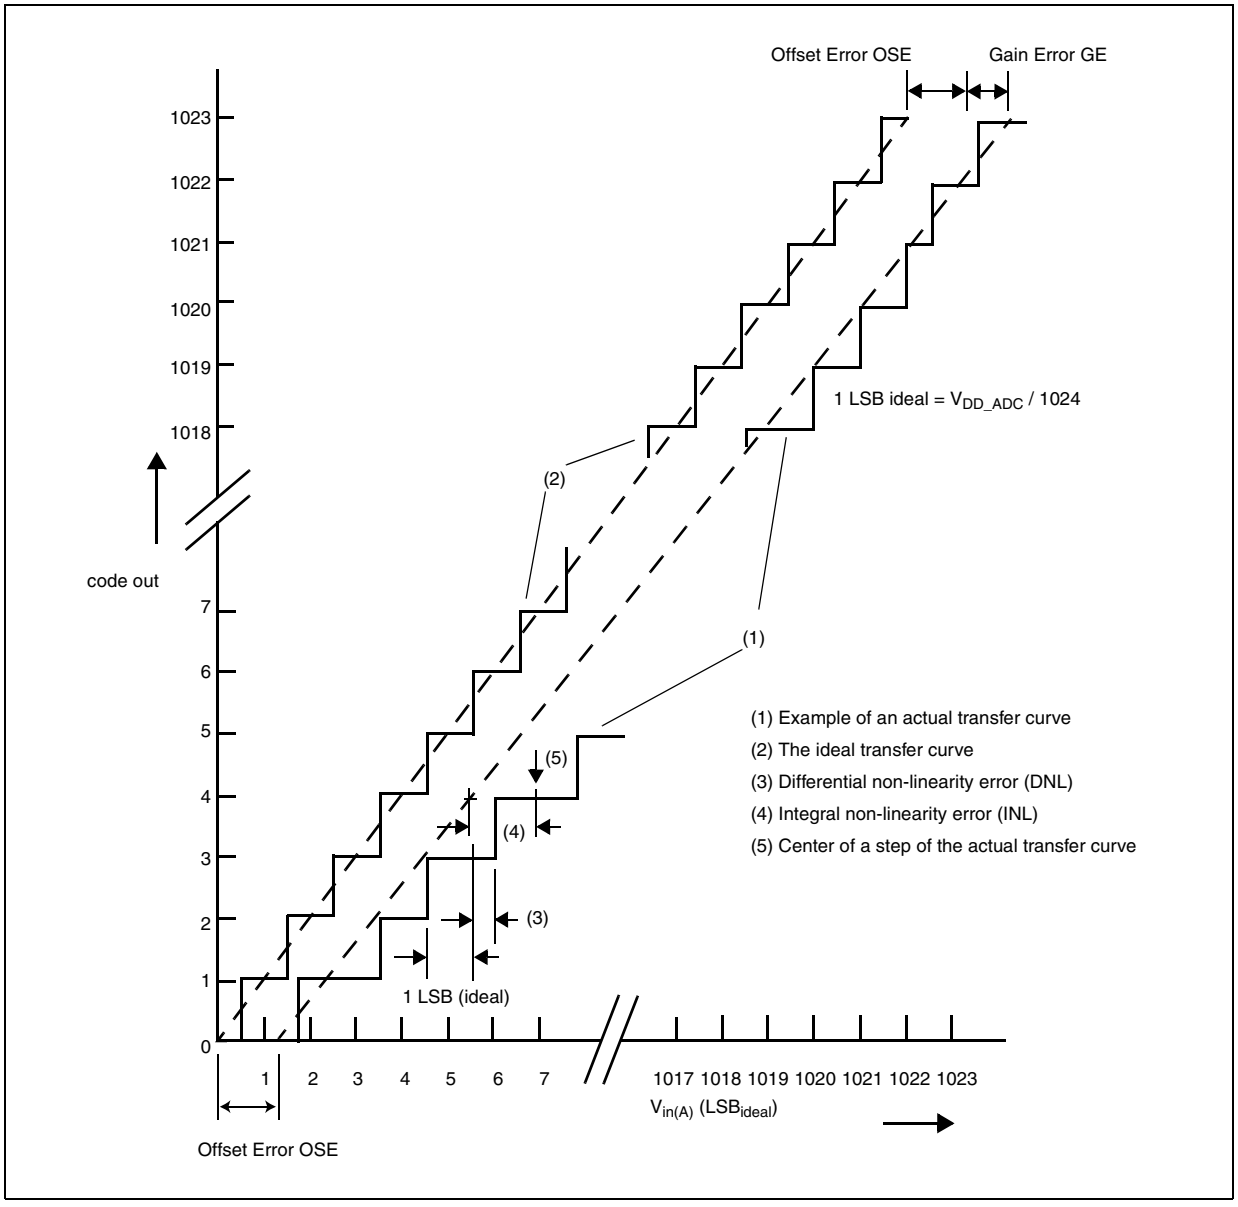

Figure 17. ADC_0 characteristic and error definitions

3.17.2 Input impedance and ADC accuracy

In the following analysis, the input circuit corresponding to the precise channels is considered.

To preserve the accuracy of the A/D converter, it is necessary that analog input pins have low AC impedance. Placing a capacitor with good high frequency characteristics at the input pin of the device can be effective: the capacitor should be as large as

possible, ideally infinite. This capacitor contributes to attenuating the noise present on the input pin; furthermore, it sources charge during the sampling phase, when the analog signal source is a high-impedance source.

A real filter can typically be obtained by using a series resistance with a capacitor on the input pin (simple RC filter). The RC filtering may be limited according to the value of source impedance of the transducer or circuit supplying the analog signal to be measured. The filter at the input pins must be designed taking into account the dynamic characteristics of the input signal (bandwidth) and the equivalent input impedance of the ADC itself.

In fact a current sink contributor is represented by the charge sharing effects with the sampling capacitance: C_S being substantially a switched capacitance, with a frequency equal to the conversion rate of the ADC, it can be seen as a resistive path to ground. For instance, assuming a conversion rate of 1 MHz, with C_S equal to 3 pF, a resistance of 330 kΩ is obtained ($R_{EQ} = 1 / (fc \times C_S)$, where fc represents the conversion rate at the considered channel). To minimize the error induced by the voltage partitioning between this resistance (sampled voltage on C_S) and the sum of $R_S + R_F + R_L + R_{SW} + R_{AD}$, the external circuit must be designed to respect the Equation 4:

Eqn. 4

$$V_A \bullet \frac{R_S + R_F + R_L + R_{SW} + R_{AD}}{R_{EQ}} < \frac{1}{2} LSB$$

Equation 4 generates a constraint for external network design, in particular on resistive path. Internal switch resistances (R_{SW} and R_{AD}) can be neglected with respect to external resistances.

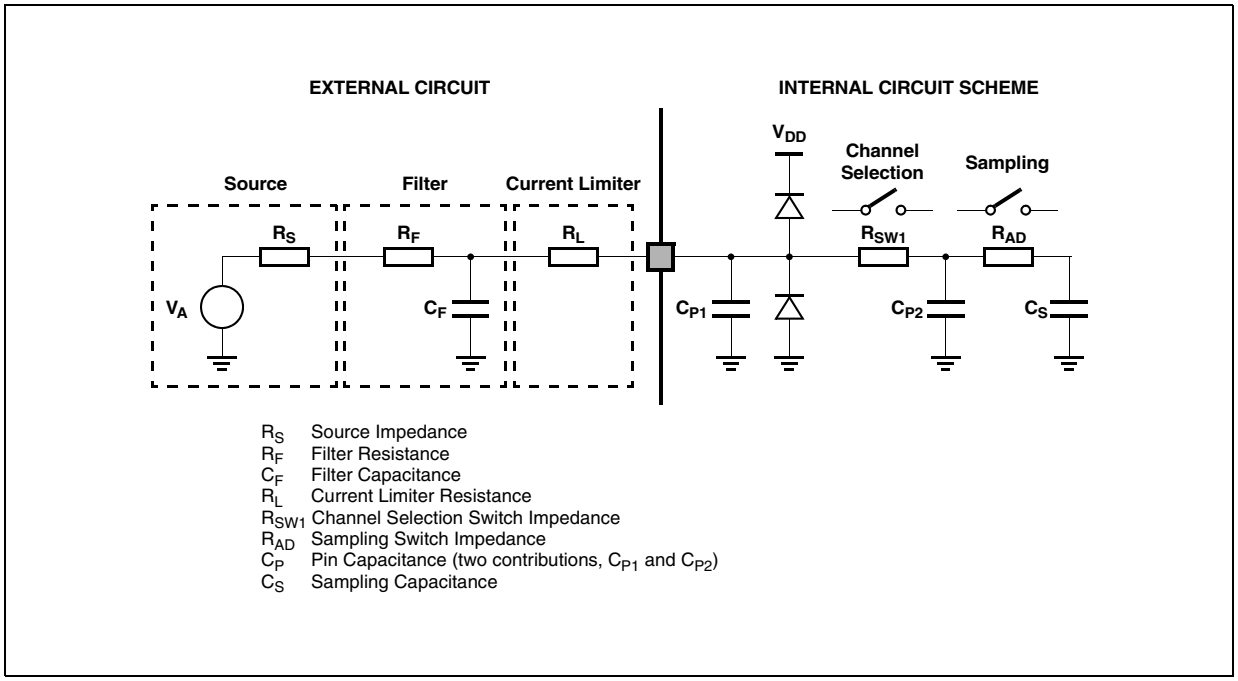

Figure 18. Input equivalent circuit (precise channels)

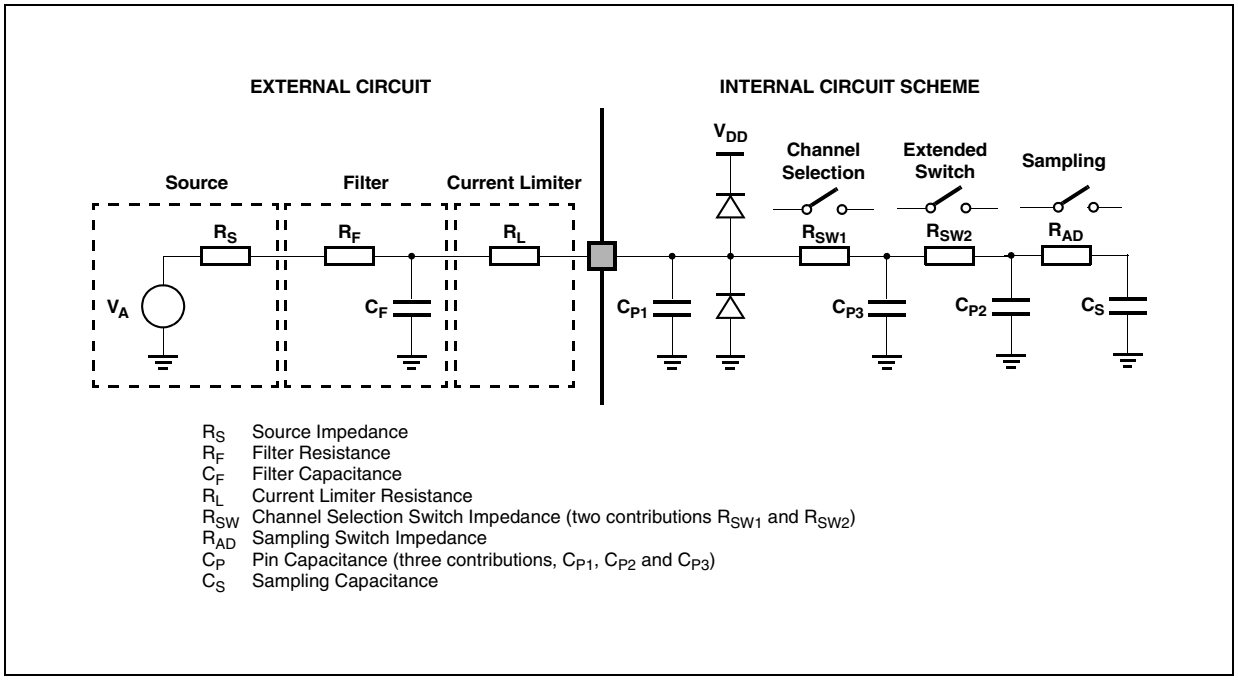

Figure 19. Input equivalent circuit (extended channels)

A second aspect involving the capacitance network shall be considered. Assuming the three capacitances C_F, C_{P1} and C_{P2} are initially charged at the source voltage V_A (refer to the equivalent circuit reported in Figure 18): A charge sharing phenomenon is installed when the sampling phase is started (A/D switch close).

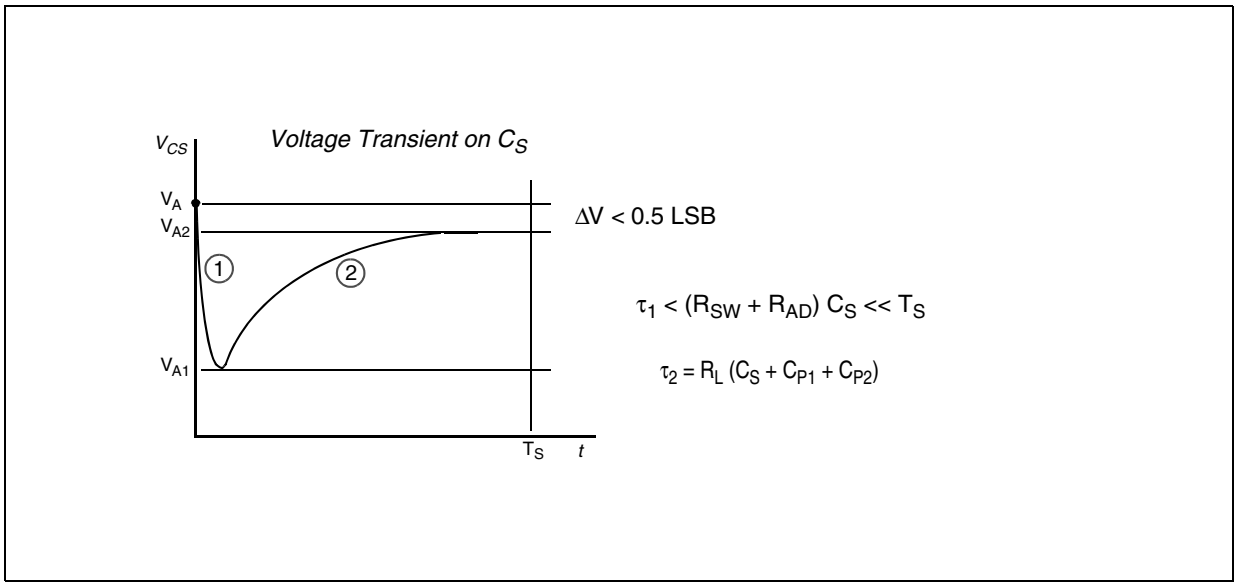

Figure 20. Transient behavior during sampling phase

In particular two different transient periods can be distinguished:

1. A first and quick charge transfer from the internal capacitance C_{P1} and C_{P2} to the sampling capacitance C_S occurs (C_S is supposed initially completely discharged): considering a worst case (since the time constant in reality would be faster) in which C_{P2} is reported in parallel to C_{P1} (call $C_P = C_{P1} + C_{P2}$), the two capacitances C_P and C_S are in series, and the time constant is

Eqn. 5

$$\tau_1 = (R_{SW} + R_{AD}) \bullet \frac{C_P \bullet C_S}{C_P + C_S}$$

Equation 5 can again be simplified considering only C_S as an additional worst condition. In reality, the transient is faster, but the A/D converter circuitry has been designed to be robust also in the very worst case: the sampling time T_S is always much longer than the internal time constant:

Eqn. 6

$$\tau_1 < (R_{SW} + R_{AD}) \bullet C_S \ll T_S$$

The charge of C_{P1} and C_{P2} is redistributed also on C_S, determining a new value of the voltage V_{A1} on the capacitance according to Equation 7:

Eqn. 7

$$V_{A1} \bullet (C_S + C_{P1} + C_{P2}) = V_A \bullet (C_{P1} + C_{P2})$$

2. A second charge transfer involves also C_F (that is typically bigger than the on-chip capacitance) through the resistance R_L: again considering the worst case in which C_{P2} and C_S were in parallel to C_{P1} (since the time constant in reality would be faster), the time constant is:

Eqn. 8

$$\tau_2 < R_L \bullet (C_S + C_{P1} + C_{P2})$$

In this case, the time constant depends on the external circuit: in particular imposing that the transient is completed well before the end of sampling time T_S, a constraints on R_L sizing is obtained:

Eqn. 9

$$10 \bullet \tau_2 = 10 \bullet R_L \bullet (C_S + C_{P1} + C_{P2}) < T_S$$

Of course, R_L shall be sized also according to the current limitation constraints, in combination with R_S (source impedance) and R_F (filter resistance). Being C_F definitively bigger than C_{P1}, C_{P2} and C_S, then the final voltage V_{A2} (at the end of the charge transfer transient) will be much higher than V_{A1}. Equation 10 must be respected (charge balance assuming now C_S already charged at V_{A1}):

Eqn. 10

$$V_{A2} \bullet (C_S + C_{P1} + C_{P2} + C_F) = V_A \bullet C_F + V_{A1} \bullet (C_{P1} + C_{P2} + C_S)$$

The two transients above are not influenced by the voltage source that, due to the presence of the $R_F C_F$ filter, is not able to provide the extra charge to compensate the voltage drop on C_S with respect to the ideal source V_A; the time constant $R_F C_F$ of the filter is very high with respect to the sampling time (T_S). The filter is typically designed to act as antialiasing.

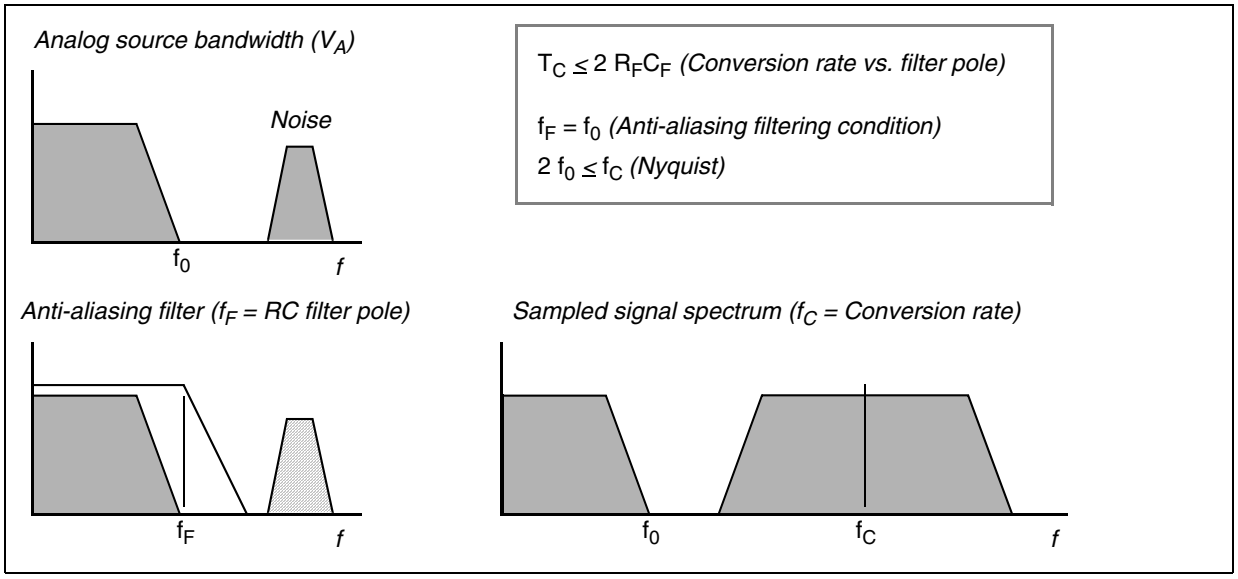

Figure 21. Spectral representation of input signal

Calling f_0 the bandwidth of the source signal (and as a consequence the cut-off frequency of the antialiasing filter, f_F), according to the Nyquist theorem the conversion rate f_C must be at least $2f_0$; it means that the constant time of the filter is greater than or at least equal to twice the conversion period (T_C). Again the conversion period T_C is longer than the sampling time T_S, which is just a portion of it, even when fixed channel continuous conversion mode is selected (fastest conversion rate at a specific channel): in conclusion it is evident that the time constant of the filter $R_F C_F$ is definitively much higher than the sampling time T_S, so the charge level on C_S cannot be modified by the analog signal source during the time in which the sampling switch is closed.

The considerations above lead to impose new constraints on the external circuit, to reduce the accuracy error due to the voltage drop on C_S; from the two charge balance equations above, it is simple to derive Equation 11 between the ideal and real sampled voltage on C_S:

Eqn. 11

$$\frac{V_{A2}}{V_A} = \frac{C_{P1} + C_{P2} + C_F}{C_{P1} + C_{P2} + C_F + C_S}$$

From this formula, in the worst case (when V_A is maximum, that is for instance 5 V), assuming to accept a maximum error of half a count, a constraint is evident on C_F value:

ADC_0 (10-bit) ***Eqn. 12***

$$C_F > 2048 \bullet C_S$$

ADC_1 (12-bit) ***Eqn. 13***

$$C_F > 8192 \bullet C_S$$

1 V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified.

2 Analog and digital V_{SS} **must** be common (to be tied together externally).

3 V_{AINx} may exceed V_{SS_ADC0} and V_{DD_ADC0} limits, remaining on absolute maximum ratings, but the results of the conversion will be clamped respectively to 0x000 or 0x3FF.

4 Duty cycle is ensured by using system clock without prescaling. When ADCLKSEL = 0, the duty cycle is ensured by internal divider by 2.

5 During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{ADC0_S}. After the end of the sample time t_{ADC0_S}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{ADC0_S} depend on programming.

6 This parameter does not include the sample time t_{ADC0_S}, but only the time for determining the digital result and the time to load the result's register with the conversion result.

7 Total Unadjusted Error: The maximum error that occurs without adjusting Offset and Gain errors. This error is a combination of Offset, Gain and Integral Linearity errors.

1 V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified

2 Analog and digital V_{SS} **must** be common (to be tied together externally).

3 V_{AINx} may exceed V_{SS_ADC1} and V_{DD_ADC1} limits, remaining on absolute maximum ratings, but the results of the conversion will be clamped respectively to 0x000 or 0xFFF.

4 During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{ADC1_S}. After the end of the sample time t_{ADC1_S}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{ADC1_S} depend on programming.

5 This parameter does not include the sample time t_{ADC1_S}, but only the time for determining the digital result and the time to load the result's register with the conversion result.

6 Duty cycle is ensured by using system clock without prescaling. When ADCLKSEL = 0, the duty cycle is ensured by internal divider by 2.

7 Total Unadjusted Error: The maximum error that occurs without adjusting Offset and Gain errors. This error is a combination of Offset, Gain and Integral Linearity errors.

1 Operating conditions: C_{out} = 10 to 50 pF, $Slew_{IN}$ = 3.5 to 15 ns.

2 For DSPI4, if SOUT is mapped to a SLOW pad while SCK is mapped to a MEDIUM pad (or vice versa), the minimum cy
should be calculated based on the rise and fall times of the SLOW pad. For MTFE=1, SOUT must not be mapped to a SL
is mapped to a MEDIUM pad.

3 The t_{CSC} delay value is configurable through a register. When configuring t_{CSC} (using PCSSCK and CSSCK fields in DSPI
delay between internal CS and internal SCK must be higher than Δt_{CSC} to ensure positive t_{CSCext}.

4 The t_{ASC} delay value is configurable through a register. When configuring t_{ASC} (using PASC and ASC fields in DSPI_CTA
between internal CS and internal SCK must be higher than Δt_{ASC} to ensure positive t_{ASCext}.

5 For DSPI*x*_CTAR*n*[PCSSCK] = 11.

6 This delay value corresponds to SMPL_PT = 00b which is bit field 9 and 8 of DSPI_MCR register.

7 SCK and SOUT are configured as MEDIUM pad.

6 Revision history

Table 46. Revision history

Revision	Date	Description of changes
1	22 Apr 2011	Initial release.
2	15 May 2013	Changed device number to MPC5606BK. In Table 2 (Functional port pins), updated PA[11] AF2, PD[13] AF2, and PH[11] AF3 I/O direction to “I/O”. In Table 3 (Pad types), corrected “Fast” in the “S” row to “Slow.” In Table 5 (PAD3V5V field description), updated footnote 2. In Table 6 (OSCILLATOR_MARGIN field description), updated footnote 2. Inserted Section 3.2.3, NVUSRO[WATCHDOG_EN] field description. In Table 8 (Absolute maximum ratings), Table 9 (Recommended operating conditions (3.3 V)), and Table 10 (Recommended operating conditions (5.0 V)), corrected the parameter description for V_{DD_ADC} to “Voltage on VDD_HV_ADC0, VDD_HV_ADC1 (ADC reference) with respect to ground (V_{SS})” In Section 3.6.1, I/O pad types bullet item, removed Nexus reference. In Table 12 (I/O input DC electrical characteristics), added specifications for 85 °C. In Table 13 (I/O pull-up/pull-down DC electrical characteristics), Table 14 (SLOW configuration output buffer electrical characteristics), Table 15 (MEDIUM configuration output buffer electrical characteristics), and Table 16 (FAST configuration output buffer electrical characteristics), changed sentence in footnote 2 to “All pads but RESET are configured in input or in high impedance state.” In Table 15 (MEDIUM configuration output buffer electrical characteristics), for V_{OL}, changed I_{OH} to I_{OL}. Updated Table 20 (I/O weight). In Table 21 (Reset electrical characteristics) changed sentence in footnote 4 to “All pads but RESET are configured in input or in high impedance state.” in Table 22 (Voltage regulator electrical characteristics), corrected the maximum value for I_{DD_BV} in Table 22 (Voltage regulator electrical characteristics) to 300 mA. In Table 23 (Low voltage monitor electrical characteristics), changed V_{PORUP} classification tag from “P” (Production testing guaranteed) to “D” (Design simulation). Changed $V_{LVDHV3BH}$ classification tag from “P” (Production testing guaranteed) to “T” (Design characterization). In Table 23 (Low voltage monitor electrical characteristics), changed $V_{LVDHV3L}$, $V_{LVDHV3BL}$ minimums from 2.7 V to 2.6 V.

Revision	Date	Description of changes
2 (cont.)	15 May 2013	In Table 24 (Electrical characteristics in different application modes), — Changed I_{DDMAX} Typ to 81 mA and I_{DDMAX} Typ to 130 mA. — Changed I_{DDRUN} Typ for fCPU = 32 MHz to 40 mA. — Changed I_{DDRUN} Typ for fCPU = 48 MHz to 54 mA. Added I_{DDRUN} Max of 96 mA. — Changed I_{DDRUN} Typ for fCPU = 64 MHz to 67 mA. Added I_{DDRUN} Max of 120 mA. — Changed I_{DDHALT} at T_A = 25 °C Typ to 10 mA and I_{DDHALT} Max to 15 mA. — Changed I_{DDHALT} at T_A = 125 °C Typ to 15 mA and I_{DDHALT} Max to 28 mA. — Changed I_{DDSTOP} T_A temperature from –40 °C to 25 °C. — Changed I_{DDSTOP} at T_A = 25 °C Typ to 130 µA and I_{DDSTOP} Max to 500 µA. — Changed I_{DDSTOP} at T_A = 55 °C Typ to 180 µA. — Changed I_{DDSTOP} at T_A = 85 °C Typ to 1 mA and I_{DDSTOP} Max to 5 mA. — Changed I_{DDSTOP} at T_A = 105 °C Typ to 3 mA and I_{DDSTOP} Max to 9 mA. — Changed I_{DDSTOP} at T_A = 125 °C Typ to 5 mA and I_{DDSTOP} Max to 14 mA. — Changed $I_{DDSTDBY2}$ at T_A = 25 °C Typ to 17 µA and Max to 80 µA. — Changed $I_{DDSTDBY2}$ at T_A = 55 °C Typ to 30 µA. — Changed $I_{DDSTDBY2}$ at T_A = 85 °C Typ to 100 µA. — Changed $I_{DDSTDBY2}$ at T_A = 105 °C Typ to 280 µA and Max to 950 µA. — Changed $I_{DDSTDBY2}$ at T_A = 125 °C Typ to 460 µA and Max to 1700 µA. — Changed the parameter classification for $I_{DDSTANDBY2}$ (T_A = 125 °C) — Changed $I_{DDSTDBY1}$ at T_A = 25 °C Typ to 12 µA and Max to 50 µA. — Changed $I_{DDSTDBY1}$ at T_A = 55 °C Typ to 24 µA. — Changed $I_{DDSTDBY1}$ at T_A = 85 °C Typ to 48 µA. — Changed $I_{DDSTDBY1}$ at T_A = 105 °C Typ to 150 µA and Max to 500 µA. — Changed $I_{DDSTDBY1}$ at T_A = 125 °C Typ to 260 µA. — Changed the third sentence of Footnote 3 to begin with “The given value is thought to be a **worst case value** (64 MHz at 125 °C) with all peripherals running.” — Removed footnotes 8 and 9 regarding I_{DDHALT} and I_{DDSTOP}. — Corrected “C” characteristics to reflect testing status. In Section 3.10, Flash memory electrical characteristics, removed the "FLASH_BIU settings vs. frequency of operation" table. In Table 28 (Flash power supply DC electrical characteristics), corrected Footnote 2 to specify 125 °C. In Section 3.14, FMPLL electrical characteristics, changed the text “the main oscillator driver” to “the FXOSC or FIRC sources.” In Table 40 (ADC input leakage current), added specifications for 85 °C. In Table 44 (DSPI characteristics), added t_{SCK} specifications for MTFE=1. In Table 44 (DSPI characteristics), updated specifications 7 and 8 to 13 ns, all DSPIs. in ADC section, corrected Equation 11. In Figure 41 (Commercial product code structure), added “**Note:** Not all options are available on all devices.” Removed Section 6, Abbreviations.
3	11 Sep 2013	Updated the temperature in table note 2 in Table 1 (MPC5606BK family comparison) from 105 ^{o}C to 125 ^{o}C.
4	25 Nov2015	Updated the Max value current for $I_{ADC0run}$ from 40 mA to 5 mA in Table 41 (ADC_0 conversion characteristics (10-bit ADC_0)).
5	7 Nov 2017	In Table 9 (Recommended operating conditions (3.3 V)) added Min value for TV_{DD}. In Table 10 (Recommended operating conditions (5.0 V)) added Min value for TV_{DD}. In Table 44 (DSPI characteristics) changed the for DSPI 2 and 4, in MTFE=1 mode from 125 to 145.
