

THE DATASHEET OF LMV358AIPWR

LMV3xxA Low-Voltage Rail-to-Rail Output Operational Amplifiers

1 Features

- Low input offset voltage: ± 1 mV
- Rail-to-rail output
- Unity-gain bandwidth: 1 MHz
- Low broadband noise: $30 \text{ nV}/\sqrt{\text{Hz}}$
- Low input bias current: 10 pA
- Low quiescent current: 70 $\mu\text{A}/\text{Ch}$
- Unity-gain stable
- Internal RFI and EMI filter
- Operational at supply voltages as low as 2.5 V
- Easier to stabilize with higher capacitive load due to resistive open-loop output impedance
- Extended temperature range: -40°C to 125°C

2 Applications

- Smoke detectors
- [Motion detectors](#)
- [Wearable devices](#)
- Large and small appliances
- EPOS
- [Barcode scanners](#)
- Sensor signal conditioning
- Power modules
- [Personal electronics](#)
- Active filters
- [HVAC: heating, ventilating, and air conditioning](#)
- [Motor control: AC induction](#)
- Low-side current sensing

3 Description

The LMV3xxA family includes single - (LMV321A), dual - (LMV358A), and quad-channel (LMV324A) low-voltage (2.5 V to 5.5 V) operational amplifiers (op amps) with rail-to-rail output swing capabilities. These op amps provide a cost-effective solution for space-constrained applications such as large appliances, smoke detectors, and personal electronics where low-voltage operation and high capacitive-load drive are required. The capacitive-load drive of the LMV3xxA family is 500 pF, and the resistive open-loop output impedance makes stabilization easier with much higher capacitive loads. These op amps are designed specifically for low-voltage operation (2.5 V to 5.5 V) with performance specifications similar to the LMV3xx devices.

The robust design of the LMV3xxA family simplifies circuit design. The op amps feature unity-gain stability, an integrated RFI and EMI rejection filter, and no-phase reversal in overdrive conditions.

The LMV3xxA family is available in industry-standard packages such as SOIC, MSOP, SOT-23, and TSSOP packages.

Package Information

| PART NUMBER | PACKAGE ⁽¹⁾ | BODY SIZE (NOM) |
|-------------|------------------------|-------------------|
| LMV321A | DBV (SOT-23, 5) | 1.60 mm × 2.90 mm |
| | DCK (SC70, 5) | 1.25 mm × 2.00 mm |
| LMV358A | D (SOIC, 8) | 3.91 mm × 4.90 mm |
| | DGK (VSSOP, 8) | 3.00 mm × 3.00 mm |
| | PW (TSSOP, 8) | 3.00 mm × 4.40 mm |
| | DDF (SOT-23, 8) | 3.00 mm × 3.00 mm |
| LMV324A | D (SOIC, 14) | 8.65 mm × 3.91 mm |
| | DYY (SOT-23, 14) | 4.20 mm × 1.90 mm |
| | PW (TSSOP, 14) | 4.40 mm × 5.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

$$\frac{V_{OUT}}{V_{IN}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1C_1}\right)$$

Single-Pole, Low-Pass Filter

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision G (February 2022) to Revision H (April 2023) | Page |
|---|-------------|
| • Updated test condition of <i>Electrical Characteristics</i> table from " $V_S = (V+) - (V-) = 2.5\text{ V to } 5.5\text{ V } (\pm 0.9\text{ V to } \pm 2.75\text{ V})$ " to " $V_S = (V+) - (V-) = 2.5\text{ V to } 5.5\text{ V } (\pm 1.25\text{ V to } \pm 2.75\text{ V})$ "..... | 7 |
| • Updated <i>Typical Characteristics</i> section..... | 8 |

| Changes from Revision F (January 2020) to Revision G (February 2022) | Page |
|--|-------------|
| • Updated the numbering format for tables, figures, and cross-references throughout the document. | 1 |
| • Added SOT-23 (DYY) package to <i>Description</i> section..... | 1 |
| • Added SOT-23 (DYY) package information to <i>Pin Configuration and Functions</i> section..... | 3 |
| • Added SOT-23 (DYY) package to <i>Thermal Information: LMV324A</i> | 6 |

| Changes from Revision E (September 2019) to Revision F (January 2020) | Page |
|---|-------------|
| • Added SOT-23 (U) package information to <i>Pin Configuration and Functions</i> section..... | 3 |

6 Specifications

6.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT | |
|--|------------------------|--------------|-------------------|------------|---|
| Supply voltage, ([V+] – [V–]) | | 0 | 6 | V | |
| Signal input pins | Voltage ⁽²⁾ | Common-mode | (V–) – 0.5 | (V+) + 0.5 | V |
| | | Differential | (V+) – (V–) + 0.2 | | V |
| | Current ⁽²⁾ | –10 | 10 | mA | |
| Output short-circuit ⁽³⁾ | | Continuous | | | |
| Operating, T _A | | –55 | 150 | °C | |
| Operating junction temperature, T _J | | | 150 | °C | |
| Storage temperature, T _{stg} | | –65 | 150 | °C | |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input pins are diode-clamped to the power-supply rails. Input signals that may swing more than 0.5 V beyond the supply rails must be current limited to 10 mA or less.
- (3) Short-circuit to ground, one amplifier per package.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±1000 |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|----------------|-----------------------|-----|-----|------|
| V _S | Supply voltage | 2.5 | 5.5 | V |
| T _A | Specified temperature | –40 | 125 | °C |

6.4 Thermal Information: LMV321A

| THERMAL METRIC ⁽¹⁾ | | LMV321A | | UNIT |
|-------------------------------|--|--------------|------------|------|
| | | DBV (SOT-23) | DCK (SC70) | |
| | | 5 PINS | 5 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 232.8 | 239.6 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 153.8 | 148.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 100.9 | 82.3 | °C/W |
| ψ_{JT} | Junction-to-top characterization parameter | 77.2 | 54.5 | °C/W |
| ψ_{JB} | Junction-to-board characterization parameter | 100.4 | 81.8 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | N/A | °C/W |

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

6.5 Thermal Information: LMV358A

| THERMAL METRIC ⁽¹⁾ | | LMV358A | | | | UNIT |
|-------------------------------|--|----------|-------------|------------|--------------|------|
| | | D (SOIC) | DGK (VSSOP) | PW (TSSOP) | DDF (SOT-23) | |
| | | 8 PINS | 8 PINS | 8 PINS | 8 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 147.4 | 201.2 | 205.8 | 183.7 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 94.3 | 85.7 | 106.7 | 112.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 89.5 | 122.9 | 133.9 | 98.2 | °C/W |
| ψ_{JT} | Junction-to-top characterization parameter | 47.3 | 21.2 | 34.4 | 18.8 | °C/W |
| ψ_{JB} | Junction-to-board characterization parameter | 89 | 121.4 | 132.6 | 97.6 | °C/W |

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

6.6 Thermal Information: LMV324A

| THERMAL METRIC ⁽¹⁾ | | LMV324A | | | UNIT |
|-------------------------------|--|----------|--------------|------------|------|
| | | D (SOIC) | DYY (SOT-23) | PW (TSSOP) | |
| | | 14 PINS | 14 PINS | 8 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 102.1 | 154.3 | 148.3 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 56.8 | 86.8 | 68.1 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 58.5 | 67.9 | 92.7 | °C/W |
| ψ_{JT} | Junction-to-top characterization parameter | 20.5 | 10.1 | 16.9 | °C/W |
| ψ_{JB} | Junction-to-board characterization parameter | 58.1 | 67.5 | 91.8 | °C/W |

6.7 Electrical Characteristics

For $V_S = (V+) - (V-) = 2.5\text{ V to }5.5\text{ V}$ ($\pm 0.9\text{ V to } \pm 2.75\text{ V}$), $T_A = 25^\circ\text{C}$, $R_L = 10\text{ k}\Omega$ connected to $V_S / 2$, and $V_{CM} = V_{OUT} = V_S / 2$ (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|----------------------------|--|---|--------------------|----------|--------------------|------------------------------|
| OFFSET VOLTAGE | | | | | | |
| V_{OS} | Input offset voltage | $V_S = 5\text{ V}$ | | ± 1 | ± 4 | mV |
| | | $V_S = 5\text{ V}$, $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | | | ± 5 | |
| dV_{OS}/dT | V_{OS} vs temperature | $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | | ± 1 | | $\mu\text{V}/^\circ\text{C}$ |
| PSRR | Power-supply rejection ratio | $V_S = 2.5\text{ to }5.5\text{ V}$, $V_{CM} = (V-)$ | 78 | 100 | | dB |
| INPUT VOLTAGE RANGE | | | | | | |
| V_{CM} | Common-mode voltage range | No phase reversal, rail-to-rail input | $(V-) - 0.1$ | | $(V+) - 1$ | V |
| CMRR | Common-mode rejection ratio | $V_S = 2.5\text{ V}$, $(V-) - 0.1\text{ V} < V_{CM} < (V+) - 1.4\text{ V}$ $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | | 86 | | dB |
| | | $V_S = 5.5\text{ V}$, $(V-) - 0.1\text{ V} < V_{CM} < (V+) - 1.4\text{ V}$ $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | | 95 | | |
| | | $V_S = 5.5\text{ V}$, $(V-) - 0.1\text{ V} < V_{CM} < (V+) + 0.1\text{ V}$ $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | 63 | 77 | | |
| | | $V_S = 2.5\text{ V}$, $(V-) - 0.1\text{ V} < V_{CM} < (V+) + 0.1\text{ V}$ $T_A = -40^\circ\text{C to }125^\circ\text{C}$ | | 68 | | |
| INPUT BIAS CURRENT | | | | | | |
| I_B | Input bias current | $V_S = 5\text{ V}$ | | ± 10 | | pA |
| I_{OS} | Input offset current | | | ± 3 | | pA |
| NOISE | | | | | | |
| E_n | Input voltage noise (peak-to-peak) | $f = 0.1\text{ Hz to }10\text{ Hz}$, $V_S = 5\text{ V}$ | | 5.1 | | μV_{PP} |
| e_n | Input voltage noise density | $f = 1\text{ kHz}$, $V_S = 5\text{ V}$ | | 33 | | $\text{nV}/\sqrt{\text{Hz}}$ |
| | | $f = 10\text{ kHz}$, $V_S = 5\text{ V}$ | | 30 | | |
| i_n | Input current noise density | $f = 1\text{ kHz}$, $V_S = 5\text{ V}$ | | 25 | | $\text{fA}/\sqrt{\text{Hz}}$ |
| INPUT CAPACITANCE | | | | | | |
| C_{ID} | Differential | | | 1.5 | | pF |
| C_{IC} | Common-mode | | | 5 | | pF |
| OPEN-LOOP GAIN | | | | | | |
| A_{OL} | Open-loop voltage gain | $V_S = 5.5\text{ V}$, $(V-) + 0.05\text{ V} < V_O < (V+) - 0.05\text{ V}$, $R_L = 10\text{ k}\Omega$ | 100 | 115 | | dB |
| | | $V_S = 2.5\text{ V}$, $(V-) + 0.04\text{ V} < V_O < (V+) - 0.04\text{ V}$, $R_L = 10\text{ k}\Omega$ | | 98 | | |
| | | $V_S = 2.5\text{ V}$, $(V-) + 0.1\text{ V} < V_O < (V+) - 0.1\text{ V}$, $R_L = 2\text{ k}\Omega$ | | 112 | | |
| | | $V_S = 5.5\text{ V}$, $(V-) + 0.15\text{ V} < V_O < (V+) - 0.15\text{ V}$, $R_L = 2\text{ k}\Omega$ | | 128 | | |
| FREQUENCY RESPONSE | | | | | | |
| GBW | Gain-bandwidth product | $V_S = 5\text{ V}$ | | 1 | | MHz |

7 Detailed Description

7.1 Overview

The LMV3xxA is a family of low-power, rail-to-rail output op amps. These devices operate from 2.5 V to 5.5 V, are unity-gain stable, and are designed for a wide range of general-purpose applications. The input common-mode voltage range includes the negative rail and allows the LMV3xxA family to be used in many single-supply applications. Rail-to-rail output swing significantly increases dynamic range, especially in low-supply applications, and makes them suitable for driving sampling analog-to-digital converters (ADCs).

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Operating Voltage

The LMV3xxA family of op amps are for operate from 2.5 V to 5.5 V. In addition, many specifications such as input offset voltage, quiescent current, offset current, and short circuit current apply from -40°C to 125°C . Parameters that vary significantly with operating voltages or temperature are shown in [Section 6.8](#).

7.3.2 Input Common Mode Range

The input common-mode voltage range of the LMV3xxA family extends 100 mV beyond the negative supply rail and within 1 V below the positive rail for the full supply voltage range of 2.5 V to 5.5 V. This performance is achieved with a P-channel differential pair, as shown in the [Functional Block Diagram](#). Additionally, a complementary N-channel differential pair has been included in parallel to eliminate issues with phase reversal that are common with previous generations of op amps. However, the N-channel pair is not optimized for operation. TI recommends limiting any voltages applied at the inputs to less than $V_{\text{CC}} - 1\text{ V}$ to ensure that the op amp conforms to the specifications detailed in the [Electrical Characteristics](#) table.

7.3.3 Rail-to-Rail Output

Designed as a low-power, low-voltage operational amplifier, the LMV3xxA family delivers a robust output drive capability. A class-AB output stage with common-source transistors achieves full rail-to-rail output swing capability. For resistive loads of 10 k Ω , the output swings to within 20 mV of either supply rail, regardless of the applied power-supply voltage. Different load conditions change the ability of the amplifier to swing close to the rails.

7.3.4 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, because of the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return to the linear state. After the charge carriers return to the linear state, the device begins to slew at the specified slew rate. Therefore, the propagation delay (in case of an overload condition) is the sum of the overload recovery time and the slew time. The overload recovery time for the LMV3xxA family is approximately 850 ns.

7.4 Device Functional Modes

The LMV3xxA family has a single functional mode. The devices are powered on as long as the power-supply voltage is between 2.5 V ($\pm 1.25\text{ V}$) and 5.5 V ($\pm 2.75\text{ V}$).

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMV3xxA family of low-power, rail-to-rail output operational amplifiers is specifically designed for portable applications. The devices operate from 2.5 V to 5.5 V, are unity-gain stable, and are suitable for a wide range of general-purpose applications. The class AB output stage is capable of driving less than or equal to 10-k Ω loads connected to any point between V+ and V-. The input common-mode voltage range includes the negative rail, and allows the LMV3xxA devices to be used in many single-supply applications.

8.2 Typical Application

8.2.1 LMV3xxA Low-Side, Current Sensing Application

Figure 8-1 shows the LMV3xxA configured in a low-side current sensing application.

Figure 8-1. LMV3xxA in a Low-Side, Current-Sensing Application

8.2.1.1 Design Requirements

The design requirements for this design are:

- Load current: 0 A to 1 A
- Output voltage: 4.9 V
- Maximum shunt voltage: 100 mV

8.2.1.2 Detailed Design Procedure

The transfer function of the circuit in [Figure 8-1](#) is given in [Equation 1](#).

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times Gain \quad (1)$$

The load current (I_{LOAD}) produces a voltage drop across the shunt resistor (R_{SHUNT}). The load current is set from 0 A to 1 A. To keep the shunt voltage below 100 mV at maximum load current, the largest shunt resistor is shown using [Equation 2](#).

$$R_{SHUNT} = \frac{V_{SHUNT_MAX}}{I_{LOAD_MAX}} = \frac{100\text{ mV}}{1\text{ A}} = 100\text{ m}\Omega \quad (2)$$

Using [Equation 2](#), R_{SHUNT} is calculated to be 100 m Ω . The voltage drop produced by I_{LOAD} and R_{SHUNT} is amplified by the LMV3xxA to produce an output voltage of approximately 0 V to 4.9 V. The gain needed by the LMV3xxA to produce the necessary output voltage is calculated using [Equation 3](#).

$$Gain = \frac{(V_{OUT_MAX} - V_{OUT_MIN})}{(V_{IN_MAX} - V_{IN_MIN})} \quad (3)$$

Using [Equation 3](#), the required gain is calculated to be 49 V/V, which is set with resistors R_F and R_G . [Equation 4](#) sizes the resistors R_F and R_G , to set the gain of the LMV3xxA to 49 V/V.

$$Gain = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Selecting R_F as 57.6 k Ω and R_G as 1.2 k Ω provides a combination that equals 49 V/V. [Figure 8-2](#) shows the measured transfer function of the circuit shown in [Figure 8-1](#). Notice that the gain is only a function of the feedback and gain resistors. This gain is adjusted by varying the ratio of the resistors and the actual resistors values are determined by the impedance levels that the designer wants to establish. The impedance level determines the current drain, the effect that stray capacitance has, and a few other behaviors. There is no optimal impedance selection that works for every system, you must choose an impedance that is ideal for your system parameters.

8.2.1.3 Application Curve

Figure 8-2. Low-Side, Current-Sense Transfer Function

8.2.2 Single-Supply Photodiode Amplifier

Photodiodes are used in many applications to convert light signals to electrical signals. The current through the photodiode is proportional to the photon energy absorbed, and is commonly in the range of a few hundred picoamps to a few tens of microamps. An amplifier in a transimpedance configuration is typically used to convert the low-level photodiode current to a voltage signal for processing in an MCU. The circuit shown in Figure 8-3 is an example of a single-supply photodiode amplifier circuit using the LMV358A.

Figure 8-3. Single-Supply Photodiode Amplifier Circuit

8.2.2.1 Design Requirements

The design requirements for this design are:

- Supply voltage: 3.3 V
- Input: 0 μ A to 10 μ A
- Output: 0.1 V to 3.2 V
- Bandwidth: 50 kHz

8.2.2.2 Detailed Design Procedure

The transfer function between the output voltage (V_{OUT}), the input current, (I_{IN}) and the reference voltage (V_{REF}) is defined in [Equation 5](#).

$$V_{OUT} = I_{IN} \times R_F + V_{REF} \quad (5)$$

Where:

$$V_{REF} = V_+ \times \left(\frac{R_1 \times R_2}{R_1 + R_2} \right) \quad (6)$$

Set V_{REF} to 100 mV to meet the minimum output voltage level by setting R1 and R2 to meet the required ratio calculated in [Equation 7](#).

$$\frac{V_{REF}}{V_+} = \frac{0.1 V}{3.3 V} = 0.0303 \quad (7)$$

The closest resistor ratio to meet this ratio sets R1 to 11.5 k Ω and R2 to 357 Ω .

The required feedback resistance can be calculated based on the input current and desired output voltage.

$$R_F = \frac{V_{OUT} - V_{REF}}{I_{IN}} = \frac{3.2 V - 0.1 V}{10 \mu A} = 310 \frac{kV}{A} \approx 309 k\Omega \quad (8)$$

Calculate the value for the feedback capacitor based on R_F and the desired –3-dB bandwidth, (f_{-3dB}) using [Equation 9](#).

$$C_F = \frac{1}{2 \times \pi \times R_F \times f_{-3 dB}} = \frac{1}{2 \times \pi \times 309 k\Omega \times 50 kHz} = 10.3 pF \approx 10 pF \quad (9)$$

The minimum op amp bandwidth required for this application is based on the value of R_F , C_F , and the capacitance on the INx– pin of the LMV358A which is equal to the sum of the photodiode shunt capacitance, (CPD) the common-mode input capacitance, (CCM) and the differential input capacitance (CD) as [Equation 10](#) shows.

$$C_{IN} = C_{PD} + C_{CM} + C_D = 47 pF + 5 pF + 1 pF = 53 pF \quad (10)$$

The minimum op amp bandwidth is calculated in [Equation 11](#).

$$f = BGW \geq \frac{C_{IN} + C_F}{2 \times \pi \times R_F \times C_F^2} \geq 324 kHz \quad (11)$$

The 1-MHz bandwidth of the LMV3xxA meets the minimum bandwidth requirement and remains stable in this application configuration.

8.2.2.3 Application Curves

The measured current-to-voltage transfer function for the photodiode amplifier circuit is shown in Figure 8-4. The measured performance of the photodiode amplifier circuit is shown in Figure 8-5.

Figure 8-4. Photodiode Amplifier Circuit AC Gain Results

Figure 8-5. Photodiode Amplifier Circuit DC Results

9 Power Supply Recommendations

The LMV3xxA family is specified for operation from 2.5 V to 5.5 V (± 1.25 V to ± 2.75 V); many specifications apply from -40°C to 125°C . [Section 6.8](#) presents parameters that may exhibit significant variance with regard to operating voltage or temperature.

CAUTION

Supply voltages larger than 6 V may permanently damage the device; see [Section 6.1](#).

Place 0.1- μF bypass capacitors close to the power-supply pins to reduce coupling errors from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see [Section 10.1](#).

9.1 Input and ESD Protection

The LMV3xxA family incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA. [Figure 9-1](#) shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

Figure 9-1. Input Current Protection

10 Layout

10.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power connections of the board and propagate to the power pins of the op amp itself. Bypass capacitors are used to reduce the coupled noise by providing a low-impedance path to ground.
 - Connect low-ESR, 0.1- μF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V^+ to ground is adequate for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace at a 90 degree angle is much better as opposed to running the traces in parallel with the noisy trace.
- Place the external components as close to the device as possible, as shown in [Figure 10-2](#). Keeping R_F and R_G close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring may significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

2. This drawing is subject to change without notice.
3. Reference JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.

EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/J 02/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/J 02/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 - Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AB.

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4211284-2/G 08/15

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D0008A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $.006$ [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.
