

FEATURES

- Input overvoltage protection, 32 V above and below the supply rails
- No phase reversal for input voltage up to ± 32 V beyond the power supply
- Rail-to-rail input and output swing
- Low power: 60 μ A per amplifier typical
- Unity-gain bandwidth
- 800 kHz typical at $V_{SY} = \pm 15$ V
- 550 kHz typical at $V_{SY} = \pm 5$ V
- 465 kHz typical at $V_{SY} = \pm 1.5$ V
- Single-supply operation: 3 V to 30 V
- Low offset voltage: 300 μ V maximum
- Large signal voltage gain: 120 dB typical
- Unity gain stable
- Qualified for automotive applications

APPLICATIONS

- Battery monitoring
- Sensor conditioners
- Portable power supply controls
- Portable instrumentation

GENERAL DESCRIPTION

The ADA4096-2 dual and ADA4096-4 quad operational amplifiers feature micropower operation and rail-to-rail input and output ranges. The extremely low power requirements and guaranteed operation from 3 V to 30 V make these amplifiers perfectly suited to monitor battery usage and to control battery charging. Their dynamic performance, including 27 nV/ $\sqrt{\text{Hz}}$ voltage noise density, recommends them for battery-powered audio applications. Capacitive loads to 200 pF are handled without oscillation.

The ADA4096-2 and ADA4096-4 have overvoltage protection inputs and diodes that allow the voltage input to extend 32 V above and below the supply rails, making this device ideal for robust industrial applications. The ADA4096-2 and ADA4096-4 feature a unique input stage that allows the input voltage to exceed either supply safely without any phase reversal or latch-up; this is called overvoltage protection, or OVP.

The dual ADA4096-2 is available in 8-lead LFCSP (2 mm \times 2 mm) and 8-lead MSOP packages. The ADA4096-2 is available in 16-lead LFCSP (3 mm \times 3 mm) and 14-lead TSSOP packages. The ADA4096-2W is qualified for automotive applications and is available in an 8-lead MSOP package.

ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
Supply Voltage	36 V
Input Voltage	
Operating Condition	$-V \leq V_{IN} \leq +V$
Overvoltage Condition ¹	$(-V) - 32V \leq V_{IN} \leq (+V) + 32V$
Differential Input Voltage ²	$\pm V_{SY}$
Input Current	± 5 mA
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	-65°C to $+150^{\circ}\text{C}$
Operating Temperature Range	-40°C to $+125^{\circ}\text{C}$
Junction Temperature Range	-65°C to $+150^{\circ}\text{C}$
Lead Temperature (Soldering, 60 seconds)	300°C

¹ Performance not guaranteed during overvoltage conditions.

² Limit the input current to ± 5 mA.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the device soldered on a 4-layer JEDEC standard printed circuit board (PCB) with zero airflow. The exposed pad is soldered to the application board.

Table 6. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
8-Lead MSOP (RM-8)	142	45	$^{\circ}\text{C}/\text{W}$
8-Lead LFCSP (CP-8-10)	76	43	$^{\circ}\text{C}/\text{W}$
14-Lead TSSOP (RU-14)	112	35	$^{\circ}\text{C}/\text{W}$
16-Lead LFCSP (CP-16-22)	75	12	$^{\circ}\text{C}/\text{W}$

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 4. 8-Lead, MSOP (RM-8), ADA4096-2

NOTES
1. CONNECT THE EXPOSED PAD TO V-.

Figure 5. 8-Lead LFCSP (CP-8-10), ADA4096-2

Table 7. Pin Function Descriptions, ADA4096-2

Pin No. ¹		Mnemonic	Description
8-Lead MSOP	8-Lead LFCSP		
1	1	OUTA	Output Channel A.
2	2	-INA	Negative Input Channel A.
3	3	+INA	Positive Input Channel A.
4	4	V-	Negative Supply Voltage.
5	5	+INB	Positive Input Channel B.
6	6	-INB	Negative Input Channel B.
7	7	OUTB	Output Channel B.
8	8	V+	Positive Supply Voltage.
N/A	EP ²	EPAD	Exposed Pad. ² For the ADA4096-2 (8-lead LFCSP only), connect the exposed pad to V-.

¹ N/A means not applicable.

² The exposed pad is not shown in the pin configuration diagram.

THEORY OF OPERATION

INPUT STAGE

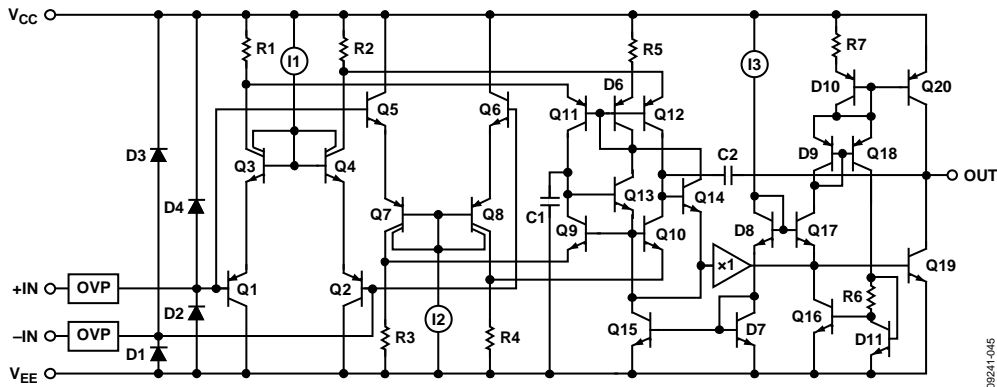

Figure 53. Simplified Schematic, ADA4096-2

Figure 53 shows a simplified schematic of the ADA4096-2. The input stage comprises two differential pairs (Q1 to Q4 and Q5 to Q8) operating in parallel. When the input common-mode voltage approaches $V_{CC} - 1.5\text{ V}$, Q1 to Q4 shut down as I1 reaches its minimum voltage compliance. Conversely, when the input common-mode voltage approaches $V_{EE} + 1.5\text{ V}$, Q5 to Q8 shut down as I2 reaches its minimum voltage compliance. This topology allows for maximum input dynamic range because the amplifier can function with its inputs at 200 mV outside the rail (at room temperature).

As with any rail-to-rail input amplifier, V_{OS} mismatch between the two input pairs determines the CMRR of the amplifier. If the input common-mode voltage range is kept within 1.5 V of each rail, transitions between the input pairs are avoided, thus improving the CMRR by approximately 10 dB (see Table 3 and Table 4).

PHASE INVERSION

Some single-supply amplifiers exhibit phase inversion when the input signal extends beyond the common-mode voltage range of the amplifier. When the input devices become saturated, the inverting and noninverting inputs exchange functions, causing the output to move in the opposing direction.

Although phase inversion persists for only as long as the inputs are saturated, it can be detrimental to applications where the amplifier is part of a closed-loop system. The ADA4096-2 family is free from phase inversion over the entire common-mode voltage range, as well as the overvoltage protected range that is stated in the Absolute Maximum Ratings section, Table 5. Figure 54 shows the ADA4096-2 in a unity-gain configuration with the input signal at $\pm 40\text{ V}$ and the amplifier supplies at $\pm 10\text{ V}$.

Figure 54. No Phase Reversal

INPUT OVERVOLTAGE PROTECTION

The ADA4096-2 family inputs are protected from input voltage excursions up to 32 V outside each rail. This feature is of particular importance in applications with power supply sequencing issues that could cause the signal source to be active before the power supplies.

Figure 55 shows the input current limiting capability of the ADA4096-2 (green curves) compared to using a 5 kΩ series resistor (red curves).

Figure 55. Input Current Limiting Capability

Figure 55 was generated with the ADA4096-2 in a buffer configuration with the supplies connected to GND (or ±15 V) and the positive input swept until it exceeds the supplies by 32 V. In general, input current is limited to 1 mA during positive overvoltage conditions and 200 μA during negative undervoltage conditions. For example, at an overvoltage of 20 V, the ADA4096-2 input current is limited to 1 mA, providing a current-limit equivalent to a series 20 kΩ resistor. Figure 55 also shows that the current limiting circuitry is active whether the amplifier is powered or not.

Note that Figure 55 represents input protection under abnormal conditions only. The correct amplifier operation input voltage range (IVR) is specified in Table 2 to Table 4.

COMPARATOR OPERATION

Although op amps are quite different from comparators, occasionally an unused section of a dual or a quad op amp may be pressed into service as a comparator; however, this is not recommended for any rail-to-rail output op amps. For rail-to-rail output op amps, the output stage is generally a ratioed current mirror with bipolar or metal-oxide semiconductor field-effect (MOSFET) transistors. With the device operating in open loop, the second stage increases the current drive to the ratioed mirror to close the loop, but it cannot, which results in an increase in supply current. With the op amp configured as a comparator, the supply current can be significantly higher (see Figure 56).

¹ Z = RoHS Compliant Part.

² W = Qualified for Automotive Applications.

AUTOMOTIVE PRODUCTS

The [ADA4096-2W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
