

**THE DATASHEET OF  
DM0365RNB**

# FSDL0365RNB, FSDM0365RNB

## Green Mode Fairchild Power Switch (FPS™)

### Features

- Internal Avalanche Rugged Sense FET
- Consumes only 0.65W at 240VAC & 0.3W load with Advanced Burst-Mode Operation
- Frequency Modulation for low EMI
- Precision Fixed Operating Frequency
- Internal Start-up Circuit
- Pulse by Pulse Current Limiting
- Over Voltage Protection
- Over Load Protection
- Internal Thermal Shutdown Function
- Auto-Restart Mode
- Under Voltage Lockout
- Low Operating Current (3mA)
- Adjustable Peak Current Limit
- Built-in Soft Start

### Applications

- SMPS for VCR, SVR, STB, DVD & DVCD
- SMPS for Printer, Facsimile & Scanner
- Adaptor for Camcorder

### Description

The FSDx0365RNB(x stands for L, M) are integrated Pulse Width Modulators (PWM) and Sense FETs specifically designed for high performance offline Switch Mode Power Supplies (SMPS) with minimal external components. Both devices are integrated high voltage power switching regulators which combine an avalanche rugged Sense FET with a current mode PWM control block. The integrated PWM controller features include: a fixed oscillator with frequency modulation for reduced EMI, Under Voltage Lock Out (UVLO) protection, Leading Edge Blanking (LEB), optimized gate turn-on/turn-off driver, Thermal Shut Down (TSD) protection and temperature compensated precision current sources for loop compensation and fault protection circuitry. The FSDx0365RNB offer better performance in Soft Start than FSDx0365RN. When compared to a discrete MOSFET and controller or RCC switching converter solution, the FSDx0365RNB reduce total component count, design size, weight and at the same time increase efficiency, productivity, and system reliability. Both devices are a basic platform well suited for cost effective designs of flyback converters.

OUTPUT POWER TABLE

FSDM0365RNB	19W	30W	16W	24W

**Table 1. Notes: 1. Typical continuous power in a non-ventilated enclosed adapter with sufficient drain pattern or something as a heat sinker measured at 50°C ambient. 2. Maximum practical continuous power in an open frame design with sufficient drain pattern or something as a heat sinker at 50°C ambient. 3. 230 VAC or 100/115 VAC with doubler.**

### Typical Circuit

**Figure 1. Typical Flyback Application**

## Pin Definitions

Pin Number	Pin Name	Pin Function Description
1	GND	Sense FET source terminal on primary side and internal control ground.
2	Vcc	Positive supply voltage input. Although connected to an auxiliary transformer winding, current is supplied from pin 5 (Vstr) via an internal switch during startup (see Internal Block Diagram section). It is not until Vcc reaches the UVLO upper threshold (12V) that the internal start-up switch opens and device power is supplied via the auxiliary transformer winding.
3	Vfb	The feedback voltage pin is the non-inverting input to the PWM comparator. It has a 0.9mA current source connected internally while a capacitor and optocoupler are typically connected externally. A feedback voltage of 6V triggers over load protection (OLP). There is a time delay while charging between 3V and 6V using an internal 5uA current source, which prevents false triggering under transient conditions but still allows the protection mechanism to operate under true overload conditions.
4	lpk	Pin to adjust the current limit of the Sense FET. The feedback 0.9mA current source is diverted to the parallel combination of an internal 2.8kΩ resistor and any external resistor to GND on this pin to determine the current limit. If this pin is tied to Vcc or left floating, the typical current limit will be 2.15A.
5	Vstr	This pin connects directly to the rectified AC line voltage source. At start up the internal switch supplies internal bias and charges an external storage capacitor placed between the Vcc pin and ground. Once the Vcc reaches 12V, the internal switch is disabled.
6, 7, 8	Drain	The Drain pin is designed to connect directly to the primary lead of the transformer and is capable of switching a maximum of 650V. Minimizing the length of the trace connecting this pin to the transformer will decrease leakage inductance.

## Pin Configuration

Figure 3. Pin Configuration (Top View)

## Absolute Maximum Ratings

(Ta=25°C, unless otherwise specified)

Characteristic	Symbol	Value	Unit
Maximum Drain Pin Voltage	V <sub>DRAIN,MAX</sub>	650	V
Maximum V <sub>str</sub> Pin Voltage	V <sub>STR,MAX</sub>	650	V
Drain Current Pulsed <sup>(1)</sup>	I <sub>DM</sub>	12.0	ADC
Single Pulsed Avalanche Energy <sup>(2)</sup>	E <sub>AS</sub>	127	mJ
Maximum Supply Voltage	V <sub>CC,MAX</sub>	20	V
Analog Input Voltage Range	V <sub>FB</sub>	-0.3 to V <sub>CC</sub>	V
Total Power Dissipation	P <sub>D</sub>	1.56	W
Operating Junction Temperature.	T <sub>J</sub>	Internally limited	°C
Operating Ambient Temperature.	T <sub>A</sub>	-25 to +85	°C
Storage Temperature Range.	T <sub>STG</sub>	-55 to +150	°C

### Note:

1. Repetitive rating: Pulse width limited by maximum junction temperature
2. L = 51mH, starting T<sub>j</sub> = 25°C
3. L = 13μH, starting T<sub>j</sub> = 25°C
4. V<sub>sd</sub> is shutdown feedback voltage ( see Protection Section in Electrical Characteristics )

## Thermal Impedance

Parameter	Symbol	Value	Unit
<b>8DIP</b>			
Junction-to-Ambient Thermal	θ <sub>JA</sub> <sup>(1)</sup>	80.01 <sup>(3)</sup>	°C/W
Junction-to-Case Thermal	θ <sub>JC</sub> <sup>(2)</sup>	18.85	°C/W
Junnction-to-Top Thermal	ψ <sub>JT</sub> <sup>(4)</sup>	33.70	°C/W

### Note:

1. Free standing with no heatsink.
  2. Measured on the DRAIN pin close to plastic interface.
  3. Without copper clad.
  4. Measured on the PKG top surface.
- \* - all items are tested with the standard JESD 51-10(DIP)

## Electrical Characteristics

(Ta = 25°C unless otherwise specified)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
<b>Sense FET SECTION</b>						
Off-State Current (Max.Rating =660V)	IDSS	VDS=660V, VGS=0V	-	-	50	μA

**Over Voltage Protection (Vovp)**

Figure 6. Over load protection

**4.2 Thermal Shutdown (TSD) :** The Sense FET and the control IC are integrated, making it easier for the control IC to detect the temperature of the Sense FET. When the temperature exceeds approximately 140°C, thermal shutdown is activated.

**4.3 Over Voltage Protection (OVP) :** In case of malfunction in the secondary side feedback circuit, or feedback loop open caused by a defect of solder, the current through the opto-coupler transistor becomes almost zero. Then, Vfb climbs up in a similar manner to the over load situation, forcing the preset maximum current to be supplied to the SMPS until the over load protection is activated. Because excess energy is provided to the output, the output voltage may exceed the rated voltage before the over load protection is activated, resulting in the breakdown of the devices in the secondary side. In order to prevent this situation, an over voltage protection (OVP) circuit is employed. In general, Vcc is proportional to the output voltage and the FPS uses Vcc instead of directly monitoring the output voltage. If Vcc exceeds 19V, OVP circuit is activated resulting in termination of the switching operation. In order to avoid undesired activation of OVP during normal operation, Vcc should be properly designed to be below 19V.

**5. Soft Start :** The FPS has an internal soft start circuit that increases the feedback voltage together with the Sense FET current slowly after it starts up. The typical soft start time is 15msec, as shown in figure 7, where progressive increments of Sense FET current are allowed during the start-up phase. The pulse width to the power switching device is progressively increased to establish the correct working conditions for transformers, inductors, and capacitors. The voltage on the output capacitors is progressively increased with the intention of smoothly establishing the required output volt-

age. It also helps to prevent transformer saturation and reduce the stress on the secondary diode.

Figure 7. Soft Start Function

**6. Burst operation :** In order to minimize power dissipation in standby mode, the FPS enters burst mode operation.

Figure 8. Circuit for Burst operation

As the load decreases, the feedback voltage decreases. As shown in figure 9, the device automatically enters burst mode when the feedback voltage drops below V<sub>BURH</sub>(500mV). Switching still continues but the current limit is set to a fixed limit internally to minimize flux density in the transformer. The fixed current limit is larger than that defined by V<sub>fb</sub> = V<sub>BURH</sub> and therefore, V<sub>fb</sub> is driven down further. Switching continues until the feedback voltage drops below V<sub>BURL</sub>(350mV). At this point switching stops and

the output voltages start to drop at a rate dependent on the standby current load. This causes the feedback voltage to rise. Once it passes  $V_{BURH}(500mV)$  switching resumes. The feedback voltage then falls and the process repeats. Burst mode operation alternately enables and disables switching of the power Sense FET thereby reducing switching loss in Standby mode.

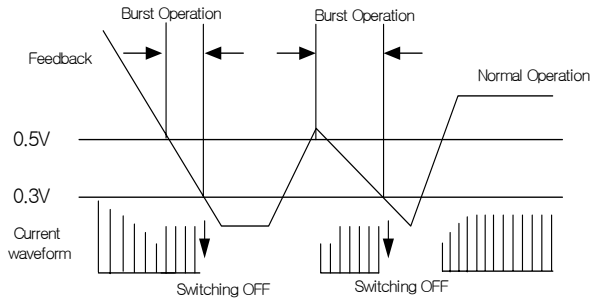

Figure 9. Circuit for Burst Operation

**7. Frequency Modulation :** EMI reduction can be accomplished by modulating the switching frequency of a switched power supply. Frequency modulation can reduce EMI by spreading the energy over a wider frequency range than the band width measured by the EMI test equipment. The amount of EMI reduction is directly related to the depth of the reference frequency. As can be seen in Figure 10, the frequency changes from 65KHz to 69KHz in 4mS for the FSDM0365RNB. Frequency modulation allows the use of a cost effective inductor instead of an AC input mode choke to satisfy the requirements of world wide EMI limits.

Figure 10. Frequency Modulation Waveform

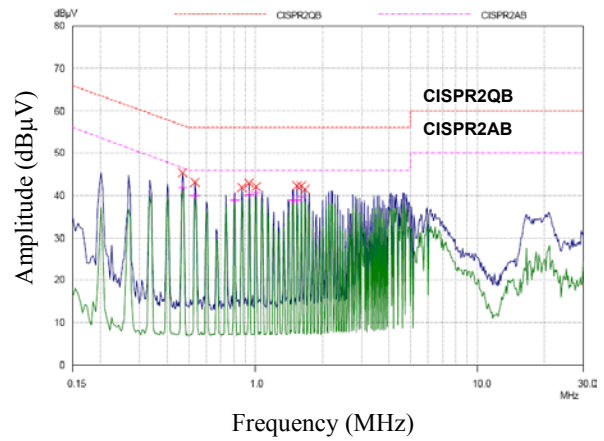

Figure 11. KA5-series FPS Full Range EMI scan(67KHz, no Frequency Modulation) with DVD Player SET

Figure 12. FSDX-series FPS Full Range EMI Scan (67KHz, with Frequency Modulation) with DVD Player SET

**8. Adjusting Current limit function:** As shown in fig 13, a combined  $2.8\text{k}\Omega$  internal resistance is connected into the non-inverting lead on the PWM comparator. A external resistance of A on the current limit pin forms a parallel resistance with the  $2.8\text{k}\Omega$  when the internal diodes are biased by the main current source of  $900\mu\text{A}$ .

**Figure 13. Peak current adjustment**

For example, FSDx0365RNB has a typical Sense FET current limit ( $I_{\text{OVER}}$ ) of  $2.15\text{A}$ . The Sense FET current can be limited to  $1\text{A}$  by inserting a  $2.4\text{k}\Omega$  between the current limit pin and ground which is derived from the following equations:

$$2.15 : 1 = 2.8\text{k}\Omega : X\text{k}\Omega ,$$

$$X = 1.3\text{k}\Omega ,$$

Since X represents the resistance of the parallel network, A can be calculated using the following equation:

$$A = X / (1 - (X/2.8\text{k}\Omega))$$

## Typical application circuit

### 1. Set Top Box Example Circuit (20W Output Power)

Figure15. 20W multiple power supply using FSDM0365RNB

#### Multiple Output, 20W, 85-265VAC Input Power supply:

Figure 15 shows a multiple output supply typical for high end set-top boxes containing high capacity hard disks for recording or LIPS(LCD Inverter Power Supply) for 15" LCD monitor. The supply delivers an output power of 20W cont./24 W peak (thermally limited) from an input voltage of 85 to 265 VAC. Efficiency at 20W, 85VAC is  $\geq 75\%$ .

The 3.3 V and 5 V outputs are regulated to  $\pm 5\%$  without the need for secondary linear regulators. DC stacking (the secondary winding reference for the other output voltages is connected to the anode of D15. For more accuracy, connection to the cathode of D15 will be better.) is used to minimize the voltage error for the higher voltage outputs. Due to the high ambient operating temperature requirement typical of a set-top box (60 °C) the FSDM0365RNB is used to reduce conduction losses without a heatsink. Resistor R5 sets the device current limit to limit overload power.

Leakage inductance clamping is provided by R1 and C8, keeping the DRAIN voltage below 650 V under all conditions. Resistor R1 and capacitor C8 are selected such that R1 dissipates power to prevent rising of DRAIN Voltage caused by leakage inductance. The frequency modulation feature of FSDM0365RNB allows the circuit shown to meet CISPR2AB with simple EMI filtering (C1, LF1 and C2) and the output grounded. The secondaries are rectified and smoothed by D12, D13, D14, and D15. Diode D15 for the 3.4V output is a Schottky diode to maximize efficiency. Diode D14 for the 5 V output is a PN type to center the 5 V output at 5 V. The 3.3 V and 5 V output voltage require two capacitors in parallel to meet the ripple current requirement.

Switching noise filtering is provided by L3, L2 and L1.

Resistor R15 prevents peak charging of the lightly loaded 23V output. The outputs are regulated by the reference (TL431) voltage in secondary. Both the 3.3 V and 5 V outputs are sensed via R13 and R14. Resistor R22 provides bias for TL431 and R21 sets the overall DC gain. Resistor R21, C209, R14 and R13 provide loop compensation.
