

**THE DATASHEET OF  
DS1813-5+**

## GENERAL DESCRIPTION

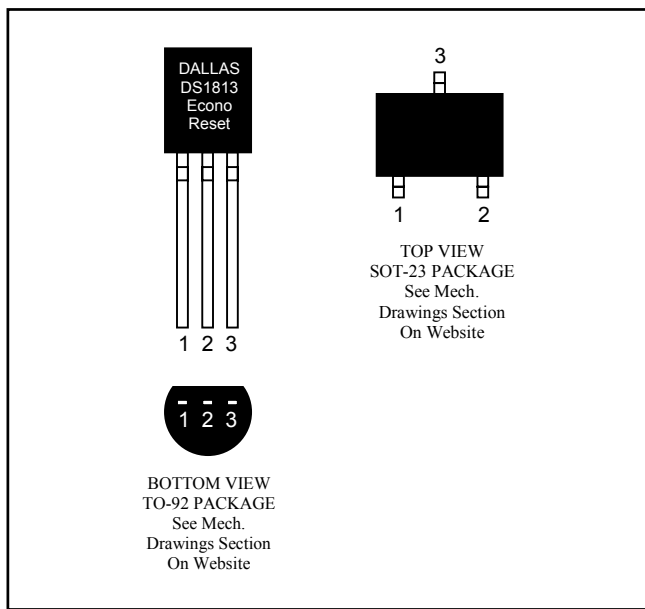

The DS1813 EconoReset uses a precision temperature reference and comparator circuit to monitor the status of the power supply ( $V_{CC}$ ). When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces reset to the active state. When  $V_{CC}$  returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 150ms to allow the power supply and processor to stabilize.

The DS1813 also monitors a pushbutton on the reset output. If the reset line is pulled low, a reset is generated upon release and will be held in reset output low for typically 150ms.

## PIN CONFIGURATIONS

## PIN DESCRIPTION

PIN		NAME	FUNCTION
TO-92	SOT-23		
1	1	$\overline{RST}$	Active-Low Reset Output
2	2	$V_{CC}$	Power Supply
3	3	GND	Ground

## OPERATION—POWER MONITOR

The DS1813 provides the functions of detecting out-of-tolerance power-supply conditions and warning a processor-based system of impending power failure. When  $V_{CC}$  is detected as out-of-tolerance, the  $\overline{RST}$  signal is asserted. On power-up,  $\overline{RST}$  is kept active for approximately 150ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before  $\overline{RST}$  is released.

## OPERATION—PUSHBUTTON RESET

The DS1813 provides for a pushbutton switch for manual reset control. When the DS1813 is not in a reset cycle, a pushbutton reset can be generated by pulling the  $\overline{RST}$  pin low for at least  $1\mu s$ . When the pushbutton is held low, the  $\overline{RST}$  is forced active low and will remain active low for about 150ms after the pushbutton is released. See Figure 2 for an application example and Figure 3 for the timing diagram.

**NOTES:**

- 1) All voltages are referenced to ground.
- 2) Measured with  $V_{CC} \geq 2.7V$ .
- 3) A  $1k\Omega$  external resistor may be required in some applications for proper operation of the microprocessor reset control circuit.
- 4) Measured with  $\overline{RST}$  output open.
- 5)  $t_R = 5\mu s$ .
- 6)  $V_{OH}$  and  $I_{OH}$  are a function of the value of  $R_P$  and the associated output load conditions.
- 7) This value is for reference in defining values for  $t_{RPD}$  and should not be considered a requirement for proper operation or use of the device.
