NOTES:

- $V_{IN} = 20\text{ V}, V_{ON/OFF} = 8\text{ V}, V_{DROD} = 0.5\text{ V}, T_A = 25^\circ\text{C}$
- $R_{\theta JA}$ is the sum of the junction–to–case and case–to–ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design while $R_{\theta CA}$ is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\theta JA}(t)} = \frac{T_J - T_A}{R_{\theta JC} + R_{\theta CA}(t)} = I_D^2(t) \times R_{DS(ON)}@T_J$$

Typical $R_{\theta CA}$ for single device operation using the board layouts shown below on FR–4 PCB in a still air environment:

- a) 180 $^\circ\text{C}/\text{W}$ when mounted on a 2oz minimum copper pad.

- Pulse Test: Pulse Width $\leq 300\ \mu\text{s}$, Duty Cycle $\leq 2.0\%$.

LOAD SWITCH APPLICATION

General Description

This device is particularly suited for computer peripheral switching applications where 20 V input and 1 A output current capability are needed. This load switch integrates a small N-Channel Power MOSFET (Q1) which drives a large P-Channel Power MOSFET (Q2) in one tiny SUPERSOT-6 package.

A load switch is usually configured for high side switching so that the load can be isolated from the active power source. A P-Channel Power MOSFET, because it does not require its drive voltage above the input voltage, is usually more cost effective than using an N-Channel device in this particular application. A large P-Channel Power MOSFET minimizes voltage drop. By using a small N-Channel device the driving stage is simplified.

Component Values

- R1: Typical 10k-1 MΩ
- R2: Typical 0-100 kΩ (optional)
- C1: Typical 1000 pF (optional)

Design Notes

- R1 is needed to turn off Q2.
- R2 can be used to soft start the switch in case the output capacitance Co is small.
- R2 should be at least 10 times smaller than R1 to guarantee Q1 turns on.
- By using R1 and R2 a certain amount of current is lost from the input. This bias current loss is given by the equation:

$$I_{BIAS_LOSS} = \frac{V_{IN}}{R1 + R2}$$
 when the switch is ON. I_{BIAS_LOSS} can be minimized by selecting a large value for R1.
- R2 and C_{RSS} of Q2 make ramp for slow turn on. If excessive overshoot current occurs due to fast turn on, additional capacitance C1 can be added externally to slow down the turn on.
