### Data Sheet

#### Description

These 10-element LED arrays are designed to display information in easily recognizable bar graph form. The packages are end stackable and therefore capable of displaying long strings of information. 1. The bar graph arrays are categorized for luminous intensity. The category is designated by a letter located on the side of the package.
2. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is that single wavelength which defines the color of the device.
3. The HDSP-4832/-4836/-4840/-4850 bar graph arrays are categorized by dominant wavelength with the category designated by a number adjacent to the intensity category letter. Only the yellow elements of the HDSP-4832/-4836 are categorized for color.

## Electrical/Optical

These versatile bar graph arrays are composed of ten light emitting diodes. The light from each LED is optically stretched to form individual elements. The Red (HDSP-4820) bar graph array LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red (HLCP-J100) bar graph array LEDs use double heterojunction AlGaAs on a GaAs substrate. HER (HDSP-4830) and Yellow (HDSP-4840) bar graph array LEDs use a GaAsP epitaxial layer on a GaP substrate. Green (HDSP-4850) bar graph array LEDs use liquid phase GaP epitaxial layer on a GaP substrate. The multicolor bar graph arrays (HDSP-4832/4836) have HER, Yellow, and Green LEDs in one package. These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 5 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation may be calculated using the  $V_{FMAX}$  models:

Standard Red HDSP-4820 series

$$V_{FMAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} \geq 5 \text{ mA}$

AlGaAs Red HLCP-J100 series

$$V_{FMAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{FMAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

HER (HDSP-4830) and Yellow (HDSP-4840) series

$$V_{FMAX} = 1.6 + I_{Peak} (45 \Omega)$$

For:  $5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$

$$V_{FMAX} = 1.75 + I_{Peak} (38 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

Green (HDSP-4850) series

$$V_{FMAX} = 2.0 + I_{Peak} (50 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

Figures 4 and 10 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_VAVG = (I_FAVG/I_FAVG \text{ DATA SHEET})\eta_{peak}(I_V \text{ DATA SHEET})$$

Where:

$I_VAVG$  is the calculated time averaged luminous intensity resulting from  $I_FAVG$ .

$I_FAVG$  is the desired time averaged LED current.

$I_FAVG \text{ DATA SHEET}$  is the data sheet test current for  $I_V \text{ DATA SHEET}$ .

$\eta_{peak}$  is the relative efficiency at the peak current, scaled from Figure 4 or 10.

$I_V \text{ DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_FAVG \text{ DATA SHEET}$ .

For example, what is the luminous intensity of an HDSP-4830 driven at 50 mA peak 1/5 duty factor?

$$I_FAVG = (50 \text{ mA}) (0.2) = 10 \text{ mA}$$

$$I_FAVG \text{ DATA SHEET} = 10 \text{ mA}$$

$$\eta_{peak} = 1.3$$

$$I_V \text{ DATA SHEET} = 3500 \mu\text{cd}$$

Therefore

$$I_VAVG = (10 \text{ mA}/10 \text{ mA}) (1.3) (3500 \text{ mcd}) = 4550 \text{ mcd}$$
