

ISO722x Dual-Channel Digital Isolators

1 Features

- 1, 5, 25, and 150-Mbps Signaling Rate Options
 - Low Channel-to-Channel Output Skew; 1-ns Max
 - Low Pulse-Width Distortion (PWD); 1-ns Max
 - Low Jitter Content; 1 ns Typ at 150 Mbps
- 50 kV/μs Typical Transient Immunity
- Operates with 2.8-V (C-Grade), 3.3-V, or 5-V Supplies
- 4-kV ESD Protection
- High Electromagnetic Immunity
- –40°C to +125°C Operating Range
- Typical 28-Year Life at Rated Voltage
(see [High-Voltage Lifetime of the ISO72x Family of Digital Isolators](#) and [Isolation Capacitor Lifetime Projection](#))
- Safety-Related Certifications
 - VDE Basic Insulation with 4000- V_{PK} V_{IOTM} , 560 V_{PK} V_{IORM} per DIN VDE V 0884-11:2017-01 and DIN EN 61010-1 (VDE 0411-1)
 - 2500 V_{RMS} Isolation per UL 1577
 - CSA Approved for IEC 60950-1 and IEC 62368-1

2 Applications

- Industrial Fieldbus
 - Modbus
 - Profibus™
 - DeviceNet™ Data Buses
- Computer Peripheral Interface
- Servo Control Interface
- Data Acquisition

3 Description

The ISO7220x and ISO7221x family devices are dual-channel digital isolators. To facilitate PCB layout, the channels are oriented in the same direction in the ISO7220x and in opposite directions in the ISO7221x. These devices have a logic input and output buffer separated by TI's silicon-dioxide (SiO₂) isolation barrier, providing galvanic isolation of up to 4000 V_{PK} per VDE. Used in conjunction with isolated power supplies, these devices block high voltage and isolate grounds, as well as prevent noise currents on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry.

A binary input signal is conditioned, translated to a balanced signal, then differentiated by the capacitive

isolation barrier. Across the isolation barrier, a differential comparator receives the logic transition information, then sets or resets a flip-flop and the output circuit accordingly. A periodic update pulse is sent across the barrier to ensure the proper dc level of the output. If this dc-refresh pulse is not received every 4 μs, the input is assumed to be unpowered or not being actively driven, and the failsafe circuit drives the output to a logic high state.

The small capacitance and resulting time constant provide fast operation with signaling rates available from 0 Mbps (DC) to 150 Mbps (The signaling rate of a line is the number of voltage transitions that are made per second expressed in the units bps). The A-option, B-option, and C-option devices have TTL input thresholds and a noise filter at the input that prevents transient pulses from being passed to the output of the device. The M-option devices have CMOS $V_{CC}/2$ input thresholds and do not have the input noise filter and the additional propagation delay.

The ISO7220x and ISO7221x family of devices require two supply voltages of 2.8 V (C-Grade), 3.3 V, 5 V, or any combination. All inputs are 5-V tolerant when supplied from a 2.8-V or 3.3-V supply and all outputs are 4-mA CMOS.

The ISO7220x and ISO7221x family of devices are characterized for operation over the ambient temperature range of –40°C to +125°C.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISO7220x	SOIC (8)	4.90 mm × 3.91 mm
ISO7221x		

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

V_{CCI} and $GNDI$ are supply and ground connections respectively for the input channels.

V_{CCO} and $GNDO$ are supply and ground connections respectively for the output channels.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision P (August 2018) to Revision Q (January 2021) Page

- Removed nominal specifications in the RECOMMENDED OPERATING CONDITIONS table..... 8

Changes from Revision O (April 2017) to Revision P (August 2018) Page

- Changed (VDE V 0884-10):2006-12 to DIN VDE V 0884-11:2017-01 throughout the document..... 1
- Changed CSA Approved for Component Acceptance Notice 5A and IEC 60950-1 to CSA Approved for IEC 60950-1 and IEC 62368-1 throughout the document..... 1
- Added the basic insulation working voltage for CSA in the *Safety-Related Certifications* table..... 10
- Changed the VDE certification number from 40016131 to 40047657 in the *Safety-Related Certifications* table..... 10
- Changed the maximum propagation delay and pulse-width distortion in each *Switching Characteristics* table .. 16
- Added $\pm 10\%$ for the V_{CC1} and V_{CC2} voltages in the condition statement of the *Switching Characteristics—5-V V_{CC1} and V_{CC2} Supplies* table .. 16
- Changed ISO722x to ISO7220 for all part numbers for the Channel-to-channel output skew parameter in each *Switching Characteristic* table..... 16

Changes from Revision N (September 2015) to Revision O (April 2017)	Page
• Changed the <i>Dissipation Characteristics</i> table to <i>Power Ratings</i> . Combined the <i>DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 Insulation Characteristics</i> table <i>IEC Package Characteristics</i> , and <i>IEC 60664-1 Ratings Table</i> in the <i>Insulation Specifications</i> table. Changed the <i>Regulatory Information</i> table to <i>Safety-Related Certifications</i> 8	8
• Deleted the maximum surge voltage, 4000 V _{PK} for VDE in the <i>Safety-Related Certifications</i> table..... 10	10
• Changed the CSA information in the <i>Safety-Related Certifications</i> table..... 10	10

Changes from Revision M (October 2014) to Revision N (September 2015)	Page
• Changed the VDE Certification from: DIN EN 60747-5-5 (VDE 0884-5) to: DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 throughout the document..... 1	1
• Updated the <i>Simplified Schematic</i> to a higher quality version..... 1	1
• Changed the max value of the IN and OUT voltage from 6 to V _{CC} + 0.5 in the <i>Absolute Maximum Ratings</i> table..... 6	6
• Changed L(I01) MIN value from 4.8 to 4 in the <i>IEC Package Characteristics</i> table..... 9	9
• Added the JEDEC package dimensions note in the <i>IEC Package Characteristics</i> table..... 9	9
• Changed L(I01) MIN value from 4.8 to 4 in the <i>IEC Package Characteristics</i> table..... 9	9
• Added the DTI parameter to the <i>IEC Package Characteristics</i> table..... 9	9
• Changed the DTI test condition From: IEC 60112 / VDE 0303 Part 1 To: DIN EN 60112 (VDE 0303-11); IEC 60112..... 9	9
• Added = 150°C to insulation resistance test condition in the <i>DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 Insulation Characteristics</i> table. 9	9
• Added table row with input side V _{CC} = X to the <i>ISO7220x or ISO7221x Function</i> table..... 26	26

Changes from Revision L (January 2012) to Revision M (August 2014)	Page
• Changed the title of this data sheet to <i>ISO722x Dual Channel Digital Isolators</i> 1	1
• Added <i>Pin Configuration and Functions</i> section, <i>Handling Rating</i> table, <i>Dissipation Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section, changed <i>Thermal Information</i> table 1	1
• Updated the <i>Features</i> section 1	1
• Added per VDE to 4000 V _{PK} in second sentence of <i>Description</i> 1	1
• Updated the <i>Regulatory Information</i> Table..... 6	6
• Added the min and max values to the Storage temperature parameter in the <i>Absolute Maximum Ratings</i> table..... 6	6
• Changed in ROC table Max col, V _{IH} row from V _{CC} to 5.5 8	8
• Changed the L(I01) parameter name to external clearance (CLR) and L(I02) to external creepage (CPG). Also changed the input-to-output test voltage (V _{PR}) parameter name to apparent charge (q _{pd}) 9	9
• Changed the <i>Device Options</i> table, Input Threshold column from ≠ symbol to ~ symbol 6 places 26	26
• Changed <i>Isolation Glossary</i> 30	30

Changes from Revision K (January 2010) to Revision L (January 2012)	Page
• Changed Feature From: Operates with 3.3-V or 5-V Supplies To: Operates with 2.8-V (C-Grade), 3.3-V or 5-V Supplies..... 1	1
• Changed Feature From: 4000-V _{peak} Isolation, 560 V _{peak} V _{IORM} To: 4000-V _{PK} V _{IOTM} , 560 V _{PK} V _{IORM} per IEC 60747-5-2 (VDE 0884, Rev2) 1	1
• Added device options to V _{CC} in the RECOMMENDED OPERATING CONDITIONS table..... 8	8
• Changed Note: (1) in the RECOMMENDED OPERATING CONDITIONS table..... 8	8
• Changed the CTI MIN value From: ≥175 V To: ≥400 V..... 9	9
• Updated the <i>Regulatory Information</i> table..... 10	10
• Changed I _{CC1} and I _{CC2} test conditions in the 5-V table..... 11	11

• Changed Table Note: (1).....	11
• Changed I _{CC1} and I _{CC2} test conditions in the V _{CC1} at 5 V, V _{CC2} at 3.3 V table.....	12
• Changed Table Note: (1).....	12
• Changed I _{CC1} and I _{CC2} test conditions in the V _{CC1} at 3.3 V, V _{CC2} at 5 V table.....	13
• Changed Table Note (1).....	13
• Changed I _{CC1} and I _{CC2} test conditions in the V _{CC1} and V _{CC2} at 3.3 V table.....	14
• Changed Table Note (1).....	14
• Added ELECTRICAL and Switching CHARACTERISTICS table for V _{CC1} and V _{CC2} at 2.8 V (ISO722xC-Only)	14
• Changed V _{CC} Undervoltage Threshold vs Free-Air Temperature	21
• Changed Failsafe Delay Time Test Circuit and Voltage Waveforms	23

Changes from Revision J (May 2009) to Revision K () **Page**

• Changed the RECOMMENDED OPERATING CONDITIONS so that Note (2) is associated with all device options in the Input pulse width and Signaling rate.....	8
• Changed Note (2) From: Typical signaling rate under ideal conditions at 25°C. To: Typical signaling rate and Input pulse width are measured at ideal conditions at 25°C.....	8
• Changed column 2 of the AVAILABLE OPTIONS table From: Signaling Rate To: Max Signaling Rate.....	26

Changes from Revision I (December 2008) to Revision J () **Page**

• Changed ISO7221C Marked As column From: TI7221C To: I7221C in the AVAILABLE OPTIONS table.....	26
--	----

Changes from Revision H (May 2008) to Revision I () **Page**

• Added "IEC 61010-1, IEC 60950-1 and CSA Approved" to the UL 1577 FEATURES bullet.....	1
---	---

Changes from Revision G (March 2008) to Revision H () **Page**

• Added Note: (1) to the RECOMMENDED OPERATING CONDITIONS table.....	8
• Added Note: (1) to the ELECTRICAL CHARACTERISTICS: V _{CC1} and V _{CC2} at 5-V table.....	11
• Added Note: (1) to the ELECTRICAL CHARACTERISTICS: V _{CC1} at 5 V, V _{CC2} at 3.3 V table.....	12
• Added Note (1): to the ELECTRICAL CHARACTERISTICS: V _{CC1} at 3.3 V, V _{CC2} at 5 V table.....	13
• Added Note (1): to the ELECTRICAL CHARACTERISTICS: V _{CC1} and V _{CC2} at 3.3 V.....	14

Changes from Revision F (August 2007) to Revision G () **Page**

• Added Part Numbers ISO7220B and ISO7221B to the data sheet.....	1
• Added 5-Mbps Signaling rate to the FEATURES list.....	1
• Added Part Numbers ISO7220B and ISO7221B to the ELECTRICAL CHARACTERISTICS: V _{CC1} and V _{CC2} at 5-V table.....	11
• Added Part Numbers ISO7220B and ISO7221B to the ELECTRICAL CHARACTERISTICS: V _{CC1} at 5 V, V _{CC2} at 3.3 V table.....	12
• Added Part Numbers ISO7220B and ISO7221B to the ELECTRICAL CHARACTERISTICS: V _{CC1} at 3.3 V, V _{CC2} at 5 V table.....	13
• Added Part Numbers ISO7220B and ISO7221B to the ELECTRICAL CHARACTERISTICS: V _{CC1} and V _{CC2} at 3.3 V.....	14
• Added PROPAGATION DELAY vs FREE-AIR TEMPERATURE, ISO722xB, <i>Propagation Delay vs Free-Air Temperature, ISO722xB</i>	21
• Added Part Numbers ISO7220B and ISO7221B to the AVAILABLE OPTIONS table.....	26

Changes from Revision E (July 2007) to Revision F () **Page**

• Added t _{sk(pp)} footnote to the SWITCHING CHARACTERISTICS: V _{CC1} and V _{CC2} at 5-V OPERATION table..	16
• Added t _{sk(o)} footnote to the SWITCHING CHARACTERISTICS: V _{CC1} and V _{CC2} at 5-V OPERATION table....	16

- Added $t_{sk(pp)}$ footnote to the SWITCHING CHARACTERISTICS: V_{CC1} at 5 V, V_{CC2} at 3.3 V OPERATION table 17
- Added $t_{sk(o)}$ footnote to the SWITCHING CHARACTERISTICS: V_{CC1} at 5 V, V_{CC2} at 3.3 V OPERATION table 17
- Added $t_{sk(pp)}$ footnote to the SWITCHING CHARACTERISTICS: V_{CC1} at 3.3 V, V_{CC2} at 5 V OPERATION table 18
- Added $t_{sk(o)}$ footnote to the SWITCHING CHARACTERISTICS: V_{CC1} at 3.3 V, V_{CC2} at 5 V OPERATION table 18
- Added $t_{sk(pp)}$ footnote to the SWITCHING CHARACTERISTICS table..... 19
- Changed 3.3- V_{RMS} Supply Current vs Signaling Rate - Re-scaled the Y-axis.....21
- Changed 5- V_{RMS} Supply Current vs Signaling Rate - New Curves.....21

Changes from Revision D (June 2007) to Revision E () **Page**

- Changed 3.3- V_{RMS} Supply Current vs Signaling Rate - New Curves.....21
- Changed 5- V_{RMS} Supply Current vs Signaling Rate - Re-scaled the Y-axis21

Changes from Revision C (May 2007) to Revision D () **Page**

- Changed *Typical ISO7220x Circuit Hook-Up* - Pin 2 (INA) label From: OUTPUT to INPUT..... 28

Changes from Revision B (May 2007) to Revision C () **Page**

- Added the Signaling rate values to the RECOMMENDED OPERATING CONDITIONS table.....8
- Changed the IEC 60664-1 RATINGS TABLE - Specification I-III test conditions From: Rated mains voltage ≤ 150 VRMS To: Rated mains voltage ≤ 300 VRMS. Added a row for the I-II specifications..... 9
- Added *ISO722xM Jitter vs Signaling Rate* cross reference to the Peak-to-peak eye-pattern jitter of the SWITCHING CHARACTERISTICS table..... 16
- Added *Time-Dependent Dielectric Breakdown Test Results* 28

Changes from Revision A (August 2006) to Revision B () **Page**

- Added the TYPICAL CHARACTERISTIC CURVES to the data sheet..... 21
- Added the PARAMETER MEASUREMENT INFORMATION to the data sheet.....23
- Added the APPLICATION INFORMATION section to the data sheet.....27
- Added the ISOLATION GLOSSARY section to the data sheet30

Changes from Revision * (July 2006) to Revision A () **Page**

- Deleted "and CSA Apporved" from the UL 1577 FEATURES bullet.....1
- Added option A to the AVAILABLE OPTIONS table..... 26

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
V_{CC} Supply voltage ⁽²⁾ , V_{CC1} , V_{CC2}	-0.5	6	V
V_I Voltage at IN, OUT	-0.5	$V_{CC} + 0.5$ ⁽³⁾	V
I_O Output current	-15	15	mA
T_J Maximum junction temperature		170	°C
T_{stg} Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* can cause permanent damage to the device. These ratings are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods can affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to network ground pin and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

6.2 ESD Ratings

		VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±4000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	V
		Machine Model, ANSI/ESDS5.2-1996	±200	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

V _{IL}	Low-level input voltage	ISO722xM		0	0.3 V _{CC}	V
T _J	Junction temperature	-40			150	°C
H	External magnetic field-strength immunity per IEC 61000-4-8 and IEC 61000-4-9 certification				1000	A/m

- (1) Typical signaling rate and Input pulse width are measured at ideal conditions at 25°C.
 (2) For the 5-V operation, V_{CC1} or V_{CC2} is specified from 4.5 V to 5.5 V.
 For the 3.3-V operation, V_{CC1} or V_{CC2} is specified from 3 V to 3.6 V.
 For the 2.8-V operation, V_{CC1} or V_{CC2} is specified at 2.8 V.

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier tied together creating a two-terminal device

6.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S Safety input, output, or supply current	R _{θJA} = 212°C/W, V _I = 5.5 V, T _J = 170°C, T _A = 25°C, see Figure 6-1			124	mA
	R _{θJA} = 212°C/W, V _I = 3.6 V, T _J = 170°C, T _A = 25°C, see Figure 6-1			190	
T _S Safety temperature				150	°C

- (1) The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Section 6.4](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

8 Detailed Description

8.1 Overview

The isolator in the [Section 8.2](#) is based on a capacitive isolation barrier technique. The I/O channel of the ISO7220x and ISO7221x family of devices consists of two internal data channels, a high-frequency channel (HF) with a bandwidth from 100 kbps up to 150 Mbps, and a low-frequency channel (LF) covering the range from 100 kbps down to DC. In principle, a single-ended input signal entering the HF-channel is split into a differential signal via the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transients, which then are converted into differential pulses by two comparators. The comparator outputs drive a NOR-gate flip-flop whose output feeds an output multiplexer. A decision logic (DCL) at the driving output of the flip-flop measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, (as in the case of a low-frequency signal), the DCL forces the output-multiplexer to switch from the high-frequency to the low-frequency channel.

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency signal, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is needed to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The ISO7220x and ISO7221x family devices use single-ended TTL or CMOS-logic switching technology. The supply voltage range is from 3 V (2.8 V for C-grade) to 5.5 V for both supplies, V_{CC1} and V_{CC2} . When designing with digital isolators, because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is, μC or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

9.2 Typical Application

The ISO7221x family of devices can be used with Texas Instruments' mixed signal micro-controller, digital-to-analog converter, transformer driver, and voltage regulator to create an isolated 4- to 20-mA current loop.

Figure 9-1. Isolated 4- to 20-mA Current Loop

9.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias (or limit current), the ISO7220x and ISO7221x devices require only two external bypass capacitors to operate.

9.2.2 Detailed Design Procedure

Figure 9-2 and Figure 9-3 show the hookup of a typical ISO7220x and ISO7221x circuit. The only external components are two bypass capacitors.

Figure 9-2. Typical ISO7220x Circuit Hook-Up

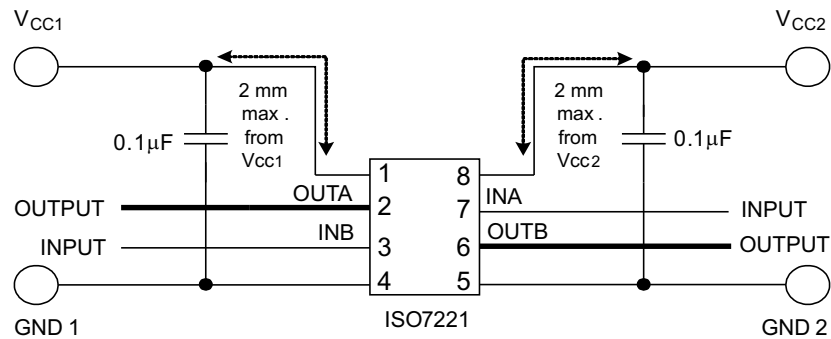

Figure 9-3. Typical ISO7221x Circuit Hook-Up

9.2.3 Application Curve

At maximum working voltage, the isolation barrier of the ISO7220x and ISO7221x family of devices has more than 28 years of life.

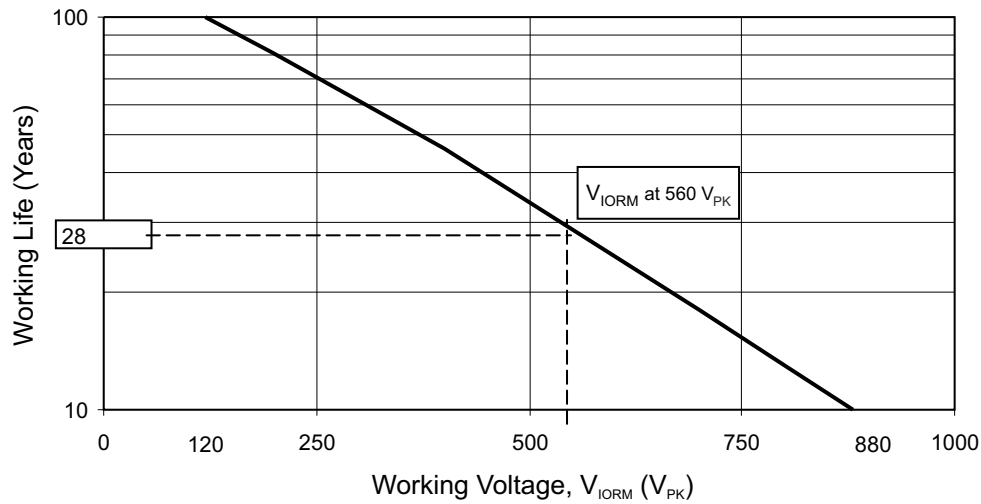

Figure 9-4. Time-Dependent Dielectric Breakdown Test Results

10 Power Supply Recommendations

To help ensure reliable operation at all data rates and supply voltages, a 0.1- μ F bypass capacitor is recommended at input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments SN6501 device. For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies](#).

11 Layout

11.1 Layout Guidelines

A minimum of four layers are required to accomplish a low EMI PCB design (see [Figure 11-1](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Route the high-speed traces on the top layer to avoid the use of vias (and the introduction of the inductances) and allow for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Place a solid ground plane next to the high-speed signal layer to establish controlled impedance for transmission line interconnects and provide an excellent low-inductance path for the return current flow.
- Place the power plane next to the ground plane to create additional high-frequency bypass capacitance of approximately 100 pF/in².
- Route the slower speed control signals on the bottom layer to allow for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. Adding a second plane system to the stack makes the stack mechanically stable and prevents it from warping. The power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

12.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

EXAMPLE BOARD LAYOUT

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
 EXPOSED METAL SHOWN
 SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
