

### Features

- **SuperFAST HIGH DENSITY PROGRAMMABLE LOGIC**
  - 2000 PLD Gates
  - 64 and 32 I/O Pin Versions, Four Dedicated Inputs
  - 64 Registers
  - High Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
  - 100% Functional, JEDEC and Pinout Compatible with ispLSI 2064V Devices
- **3.3V LOW VOLTAGE 2064 ARCHITECTURE**
  - Interfaces with Standard 5V TTL Devices
- **HIGH-PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - $f_{max} = 280\text{MHz}$  Maximum Operating Frequency
  - $t_{pd} = 3.5\text{ns}$  Propagation Delay
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - 3.3V In-System Programmability (ISP™) Using Boundary Scan Test Access Port (TAP)
  - Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of Wired-OR or Bus Arbitration Logic
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Devices for Faster Prototyping
- **100% IEEE 1149.1 BOUNDARY SCAN TESTABLE**
- **THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAs**
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
- **LEAD-FREE PACKAGE OPTIONS**

### Functional Block Diagram

### Description

The ispLSI 2064VE is a High Density Programmable Logic Device available in 64 and 32 I/O-pin versions. The device contains 64 Registers, four Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2064VE features in-system programmability through the Boundary Scan Test Access Port (TAP) and is 100% IEEE 1149.1 Boundary Scan Testable. The ispLSI 2064VE offers non-volatile reprogrammability of the logic, as well as the interconnect, to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 2064VE device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...B7 (see Figure 1). There are a total of 16 GLBs in the ispLSI 2064VE device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

**Functional Block Diagram**

**Figure 1. ispLSI 2064VE Functional Block Diagram (64-I/O and 32-I/O Versions)**

The 64-I/O 2064VE contains 64 I/O cells, while the 32-I/O version contains 32 I/O cells. Each I/O cell is directly connected to an I/O pin and can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5-Volt signal levels to support mixed-voltage systems.

Eight GLBs, 32 or 16 I/O cells, two dedicated inputs and two or one ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 or 16 universal I/O cells by two or one ORPs. Each ispLSI 2064VE device contains two Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2064VE device are selected using the dedicated clock pins. Three dedicated clock pins (Y0,

Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

**Programmable Open-Drain Outputs**

In addition to the standard output configuration, the outputs of the ispLSI 2064VE are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the Lattice software tools.

## Absolute Maximum Ratings <sup>1</sup>

Supply Voltage  $V_{CC}$  ..... -0.5 to +5.4V  
 Input Voltage Applied ..... -0.5 to +5.6V  
 Off-State Output Voltage Applied ..... -0.5 to +5.6V  
 Storage Temperature ..... -65 to 150°C  
 Case Temp. with Power Applied ..... -55 to 125°C  
 Max. Junction Temp. ( $T_J$ ) with Power Applied ..... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

Table 2-0042/2064VE

## Power Consumption

Power consumption in the ispLSI 2064VE device depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 3 shows the relationship between power and operating speed.

**Figure 3. Typical Device Power Consumption vs fmax**

Notes: Configuration of four 16-bit counters  
Typical current at 3.3V, 25° C

ICC can be estimated for the ispLSI 2064VE using the following equation:

$$I_{CC}(mA) = 8 + (\# \text{ of PTs} * 0.67) + (\# \text{ of Nets} * F_{max} * 0.0045)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 3.3V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

**64-I/O Signal Descriptions**

Signal Name	Description
RESET	Active Low (0) Reset pin resets all the registers in the device.
GOE 0, GOE1	Global Output Enable input pins.
Y0, Y1, Y2	Dedicated Clock Input – These clock inputs are connected to one of the clock inputs of all the GLBs in the device.
BSCAN	Input – Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
TDI/IN 0	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a serial data input pin to load programming data into the device. (2) When BSCAN is high, it functions as a dedicated input pin.
TCK/IN 3	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a clock pin for the Boundary Scan state machine. (2) When BSCAN is high, it functions as a dedicated input pin.
TMS/IN 1	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a mode control pin for the Boundary Scan state machine. (2) When BSCAN is high, it functions as a dedicated input pin.
TDO/IN 2	Output/Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as an output pin to read serial shift register data. (2) When BSCAN is high, it functions as a dedicated input pin.
GND	Ground (GND)
VCC	Vcc
NC <sup>1</sup>	No Connect
I/O	Input/Output Pins – These are the general purpose I/O pins used by the logic array.

1. NC pins are not to be connected to any active signals, VCC or GND.

**32-I/O Signal Descriptions**

Signal Name	Description
GOE 0/IN 3	This pin performs one of two functions. It can be programmed to function as a Global Output Enable pin or a Dedicated Input pin.
GOE 1/Y0	This pin performs one of two functions. (1) It can be programmed to function as a Global Output Enable or a Dedicated Clock input. (2) This clock input is connected to one of the clock inputs of all GLBs on the device.
RESET/Y1	This pin performs two functions: (1) Active Low (0) Reset pin which resets all of the registers in the device. (2) When active low (0), it functions as a dedicated clock input.
BSCAN	Input – Dedicated in-system programming Boundary Scan Enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
TDI/IN 0	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a serial data input pin to load programming data into the device. (2) When BSCAN is high, it functions as a dedicated input pin.
TMS/IN 2	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a mode control pin for the Boundary Scan state machine. (2) When BSCAN is high, it functions as a dedicated input pin.
TDO/IN 1	Output/Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as an output pin to read serial shift register data. (2) When BSCAN is high, it functions as a dedicated input pin.
TCK/Y2	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a clock pin for the Boundary Scan state machine. (2) When BSCAN is high, it functions as a dedicated clock input.
GND	Ground (GND)
VCC	Vcc
NC <sup>1</sup>	No Connect
I/O	Input/Output pins – These are the general purpose I/O pins used by the logic array.

1. NC pins are not to be connected to any active signals, VCC or GND.
