Military Grade SmartFusion Customizable System-on-Chip (cSoC)

Product Benefits (Ask a Question)

- 100% Military Temperature Tested and Qualified from –55 °C to 125 °C
- Not Susceptible to Neutron-Induced Configuration Loss

Microcontroller Subsystem (MSS) (Ask a Question)

- Hard 50 MHz 32-Bit ARM® Cortex®-M3
  - Fully Tested Across Military Temperature Range (–55 °C to 125 °C)
  - 1.25 DMIPS/MHz Throughput from Zero Wait State Memory
  - Memory Protection Unit (MPU)
  - Single Cycle Multiplication, Hardware Divide
  - JTAG Debug (4 wires), Serial Wire Debug (SWD, 2 wires), and Single Wire Viewer (SWV) Interfaces
- Internal Memory
  - Embedded Nonvolatile Flash Memory (eNVM), 128 KB to 512 KB
  - Embedded High-Speed SRAM (eSRAM), 16 KB to 64 KB, Implemented in 2 Physical Blocks to Enable Simultaneous Access from 2 Different Masters
- Multi-Layer AHB Communications Matrix
  - Provides up to 16 Gbps of On-Chip Memory Bandwidth,[1] Allowing Multi-Master Schemes
- 10/100 Ethernet MAC with RMII Interface[2]
- Programmable External Memory Controller, Which Supports:
  - Asynchronous Memories
  - NOR Flash, SRAM, and PSRAM
  - Synchronous SRAMs
- Two I^2C Peripherals
- Two 16550 Compatible UARTs
- Two SPI Peripherals
- Two 32-Bit Timers
- 32-Bit Watchdog Timer
- 8-Channel DMA Controller to Offload the Cortex-M3 processor from Data Transactions
- Clock Sources:
  - 32 kHz to 20 MHz Main Oscillator
  - Battery-Backed 32 KHz Low Power Oscillator with Real-Time Counter (RTC)

[1] Theoretical maximum
[2] A2F500 devices

© 2026 Microchip Technology Inc. and its subsidiaries

- 100 MHz Embedded RC Oscillator; Up to 3% Accurate at Military Temperature
- Embedded Analog PLL with 4 Output Phases (0, 90, 180, and 270)

High-Performance FPGA (Ask a Question)

- Based on proven ProASIC®3 FPGA Fabric
- Low Power, Firm-Error Immune 130-nm, 7-Layer Metal, Flash-Based CMOS Process
- Nonvolatile, Live at Power-Up, Retains Program When Powered Off
- 350 MHz System Performance
- Embedded SRAMs and FIFOs
  - Variable Aspect Ratio 4608-Bit SRAM Blocks
  - x1, x2, x4, x9, and x18 Organizations
  - True Dual-Port SRAM (excluding x18)
  - Programmable Embedded FIFO Control Logic
- Secure ISP with 128-Bit AES via JTAG
- FlashLock® to Secure FPGA Contents
- Five Clock Conditioning Circuits (CCCs) with up to 2 Integrated Analog PLLs
  - Phase Shift, Multiply/Divide, and Delay Capabilities
  - Frequency: Input 1.5–350 MHz, Output 0.75–350 MHz

Programmable Analog (Ask a Question)

Analog Front-End (AFE) (Ask a Question)

- Up to Three 12-Bit SAR ADCs
  - 500 Ksps in 12-Bit Mode
  - 550 Ksps in 10-Bit Mode
  - 600 Ksps in 8-Bit Mode
- Internal 2.56V Reference or Optional External Reference
- One First-Order ΣΔ DAC (sigma-delta) per ADC
  - 12-Bit 500 Ksps Update Rate
- Up to 5 High-Performance Analog Signal Conditioning Blocks (SCB) per Device, Each Including:
  - Two High-Voltage Bipolar Voltage Monitors (with 4 input ranges from ±2.5V to –11.5/12V) with 4% Accuracy
  - High Gain Current Monitor, Differential Gain = 50, up to 12V Common Mode
  - Temperature Monitor (Resolution = ¼ °C in 12-Bit Mode; Accurate from –55 °C to 150 °C)
- Up to Ten High-Speed Voltage Comparators (tpd = 15 ns)

Analog Compute Engine (ACE) (Ask a Question)

- Offloads Cortex-M3–Based MSS from Analog Initialization and Processing of ADC, DAC, and SCBs
- Sample Sequence Engine for ADC and DAC Parameter Set-Up
- Post-Processing Engine for Functions such as Low-Pass Filtering and Linear Transformation
- Easily Configured via GUI in Libero® System-on-Chip (SoC) Software

© 2026 Microchip Technology Inc. and its subsidiaries

I/Os and Operating Voltage (Ask a Question)

- FPGA I/Os
  - LVDS, PCI, PCI-X, up to 24 mA IOH/IOL
  - Up to 350 MHz
- MSS I/Os
  - Schmitt Trigger, up to 6 mA IOH, 8 mA IOL
  - Up to 180 MHz
- Single 3.3V Power Supply with On-Chip 1.5V Regulator
- External 1.5V Is Allowed by Bypassing Regulator (digital VCC = 1.5V for FPGA and MSS, analog VCC = 3.3V and 1.5V)

SmartFusion cSoC Family Product Table (Ask a Question)

Table 1. SmartFusion cSoC Family Product Table

SmartFusion® cSoC		A2F060[4]	A2F500
FPGA Fabric	System Gates	60,000	500,000
	Tiles (D-flip-flops)	1,536	11,520
	RAM Blocks (4,608 bits)	8	24
Microcontroller Subsystem (MSS)	Flash (KB)	128	512
	SRAM (KB)	16	64
	Cortex-M3 with memory protection unit (MPU)	Yes	
	10/100 Ethernet MAC	No	Yes
	External Memory Controller (EMC)	24-bit address,16-bit data	
	DMA	8 Ch	
	I^2C	2	
	SPI	2	
	16550 UART	2	
	32-Bit Timer	2	
	PLL	1	2[1]
	32 KHz Low Power Oscillator	1	
	100 MHz On-Chip RC Oscillator	1	
	Main Oscillator (32 KHz to 20 MHz)	1

Notes:

1. Two PLLs are available in FG484 (one PLL in FG256).
2. These functions share I/O pins and may not all be available at the same time. See the “Analog Front-End Overview” section in the SmartFusion Programmable Analog User’s Guide for details.
3. Available on FG484 only.
4. Device A2F060 is discontinued.

Table 2. Package I/Os: MSS + FPGA I/Os

Device	A2F060[5]	A2F500	
Package	FG256	FG256	FG484
Direct Analog Inputs	11	8	12
Shared Analog Inputs[1]	4	16	20
Total Analog Inputs	15	24	32
Total Analog Outputs	1	2	3
MSS I/Os[2, 3]	26[4]	25	41
FPGA I/Os	66	66	128
Total I/Os	108	117	204

Notes:

1. These pins are shared between direct analog inputs to the ADCs and voltage/current/temperature monitors.
2. 16 MSS I/Os are multiplexed and can be used as FPGA I/Os, if not needed for MSS. These I/Os support Schmitt triggers and support only LVTTL and LVCMOS (1.5/1.8/2.5, 3.3V) standards.
3. 9 MSS I/Os are primarily for 10/100 Ethernet MAC and are also multiplexed and can be used as FPGA I/Os if Ethernet MAC is not used in a design. These I/Os support Schmitt triggers and support only LVTTL and LVCMOS (1.5V, 1.8V, 2.5V, or 3.3V) standards.
4. 10/100 Ethernet MAC is not available on A2F060.
5. Device A2F060 is discontinued.

1. SmartFusion Family Overview (Ask a Question)

1.1. Introduction (Ask a Question)

The SmartFusion® family of cSoCs builds on the technology first introduced with the Fusion mixed signal FPGAs. SmartFusion cSoCs are made possible by integrating FPGA technology with programmable high-performance analog and hardened ARM Cortex-M3 microcontroller blocks on a flash semiconductor process. The SmartFusion cSoC takes its name from the fact that these three discrete technologies are integrated on a single chip, enabling the lowest cost of ownership and smallest footprint solution to you.

1.2. General Description (Ask a Question)

1.2.1. Microcontroller Subsystem (MSS) (Ask a Question)

The MSS is composed of a 100 MHz Cortex-M3 processor and integrated peripherals, which are interconnected via a multi-layer AHB bus matrix (ABM). This matrix allows the Cortex-M3 processor, FPGA fabric master, Ethernet Message Authentication Controller (MAC), when available, and peripheral DMA (PDMA) controller to act as masters to the integrated peripherals, FPGA fabric, embedded Nonvolatile Memory (eNVM), embedded Synchronous RAM (eSRAM), external memory controller (EMC), and Analog Compute Engine (ACE) blocks.

SmartFusion cSoCs of different densities offer various sets of integrated peripherals. Available peripherals include SPI, I^2C, and UART serial ports, embedded FlashROM (EFROM), 10/100 Ethernet MAC, timers, Phase-Locked Loops (PLLs), oscillators, Real-Time Counters (RTC), and Peripheral DMA Controller (PDMA).

1.2.2. Programmable Analog (Ask a Question)

1.2.2.1. Analog Front-End (AFE) (Ask a Question)

SmartFusion cSoCs offer an enhanced analog front-end compared to Fusion devices. The Successive Approximation Register Analog-to-Digital Converters (SAR ADC) are similar to those found on Fusion devices. SmartFusion cSoC also adds first order Sigma-Delta Digital-to-Analog Converters (SDD DAC).

SmartFusion cSoCs can handle multiple analog signals simultaneously with its Signal Conditioning Blocks (SCBs). SCBs are made of a combination of Active Bipolar Prescalers (ABPS), comparators, current monitors and temperature monitors. ABPS modules allow larger bipolar voltages to be fed to the ADC. Current monitors take the voltage across an external sense resistor and convert it to a voltage suitable for the ADC input range. Similarly, the temperature monitor reads the current through an external PN-junction (diode or transistor) and converts it internally for the ADC. The SCB also includes comparators to monitor fast signal thresholds without using the ADC. The output of the comparators can be fed to the analog compute engine or the ADC.

1.2.2.2. Analog Compute Engine (ACE) (Ask a Question)

The mixed signal blocks found in SmartFusion cSoCs are controlled and connected to the rest of the system via a dedicated processor called the Analog Compute Engine (ACE). The role of the ACE is to offload control of the analog blocks from the Cortex-M3, thus offering faster throughput or better power consumption compared to a system where the main processor is in charge of monitoring the analog resources. The ACE is built to handle sampling, sequencing, and post-processing of the ADCs, DACs, and SCBs.

1.2.3. ProASIC3 FPGA Fabric (Ask a Question)

The SmartFusion cSoC family, based on the proven, low power, firm-error immune ProASIC®3 flash FPGA architecture, benefits from the advantages only flash-based devices offer:

1.2.3.1. Reduced Cost of Ownership (Ask a Question)

Advantages to the designer extend beyond low unit cost, high performance, and ease of use. Flash-based SmartFusion cSoCs are live at power-up and do not need to be loaded from an external

© 2026 Microchip Technology Inc. and its subsidiaries

boot PROM at each power-up. On-board security mechanisms prevent access to the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote In-System Programming (ISP) to support future design iterations and critical field upgrades, with confidence that valuable IP cannot be compromised or copied. Secure ISP can be performed using the industry standard AES algorithm with MAC data authentication on the device.

1.2.3.2. Low Power (Ask a Question)

Flash-based SmartFusion cSoCs exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. With SmartFusion cSoCs, there is no power-on current and no high current transition, both of which are common with SRAM-based FPGAs.

SmartFusion cSoCs also have low dynamic power consumption and support very low power time-keeping mode, offering further power savings.

1.2.3.3. Security (Ask a Question)

As the nonvolatile, flash-based SmartFusion cSoC family requires no boot PROM, there is no vulnerable external bitstream. SmartFusion cSoCs incorporate FlashLock®, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only a device with nonvolatile flash programming can offer.

SmartFusion cSoCs utilize a 128-bit flash-based key lock and a separate AES key to provide security for programmed IP and configuration data. The FlashROM data in Fusion devices can also be encrypted prior to loading. Additionally, the flash memory blocks can be programmed during runtime using the AES-128 block cipher encryption standard (FIPS Publication 192).

SmartFusion cSoCs with AES-based security are designed to provide protection for remote field updates over public networks, such as the Internet, and help to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves. As an additional security measure, the FPGA configuration data of a programmed Fusion device cannot be read back, although secure design verification is possible. During design, the user controls and defines both internal and external access to the flash memory blocks.

Security, built into the FPGA fabric, is an inherent component of the SmartFusion cSoC family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. SmartFusion cSoCs, with FlashLock and AES security, are unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry standard security measures, making remote ISP feasible. A SmartFusion cSoC provides the highest security available for programmable logic designs.

1.2.3.4. Single Chip (Ask a Question)

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based SmartFusion cSoCs do not require system configuration components such as electrically erasable programmable read-only memories (EEPROMs) or microcontrollers to load device configuration data during power-up. This reduces bill-of-materials costs and PCB area, and increases system security and reliability.

1.2.3.5. Live at Power-Up (Ask a Question)

Flash-based SmartFusion cSoCs are live at power-up (LAPU). LAPU SmartFusion cSoCs greatly simplify total system design and reduce total system cost by eliminating the need for complex programmable logic devices (CPLDs). SmartFusion LAPU clocking (PLLs) replace off-chip clocking resources. In addition, glitches and brownouts in system power will not corrupt the SmartFusion flash configuration. Unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables reduction or complete removal of expensive voltage monitor and brownout detection devices from the PCB design. Flash-based SmartFusion cSoCs simplify total system design and reduce cost and design risk, while increasing system reliability.

© 2026 Microchip Technology Inc. and its subsidiaries

1.2.3.6. Immunity to Firm Errors (Ask a Question)

Firm errors occur most commonly when high-energy neutrons, generated in the atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O configuration behavior in an unpredictable way.

Another source of radiation-induced firm errors is alpha particles. For alpha radiation to cause a soft or firm error, its source must be in very close proximity to the affected circuit. The alpha source must be in the package molding compound or in the die itself. While low-alpha molding compounds are being used increasingly, this helps reduce but does not entirely eliminate alpha-induced firm errors.

Firm errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not occur in SmartFusion cSoCs. Once it is programmed, the flash cell configuration element of SmartFusion cSoCs cannot be altered by high energy neutrons and is therefore immune to errors from them. Recoverable (or soft) errors occur in the user data SRAMs of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

1.2.4. Specifying I/O States During Programming (Ask a Question)

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the FlashPro User's Guide for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Specifying I/O States During Programming).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

   1 – I/O is set to drive out logic High

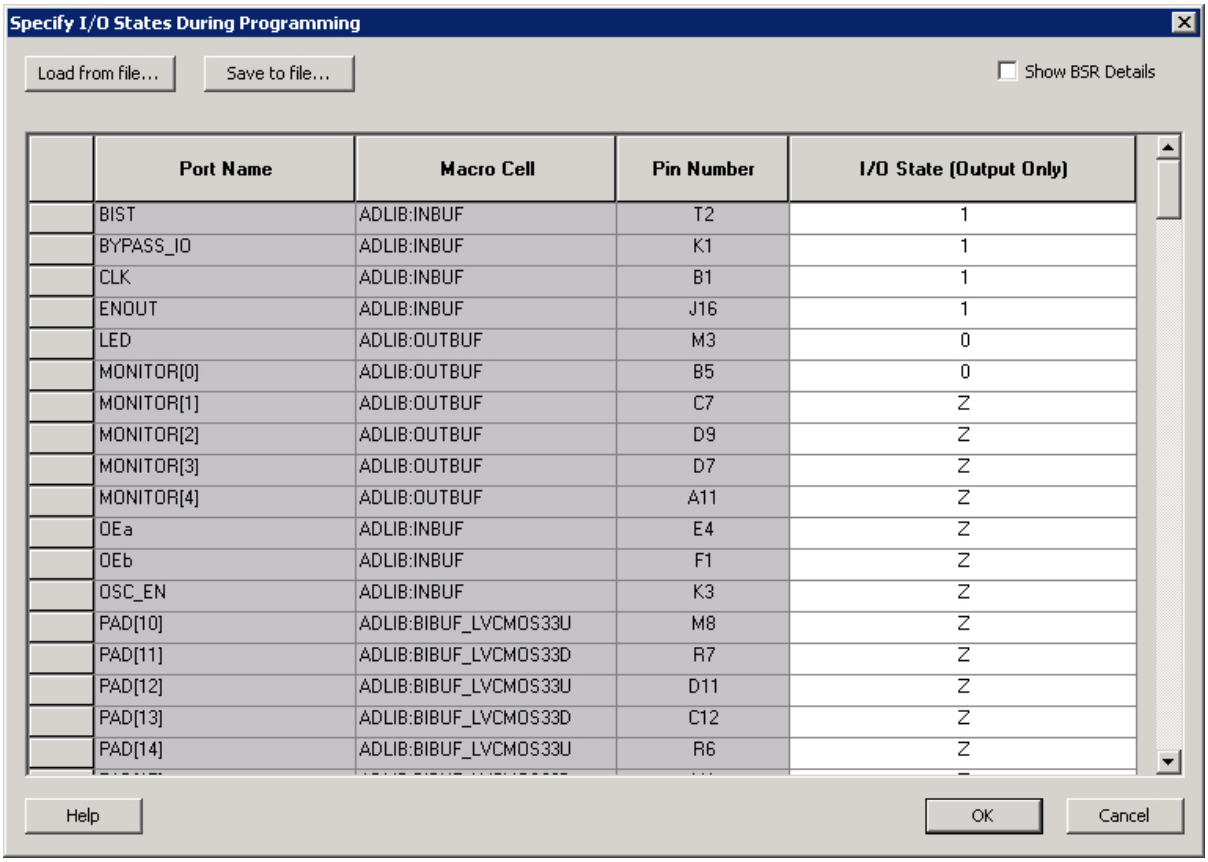
   0 – I/O is set to drive out logic Low

   Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming

   Z -Tri-State: I/O is tristated

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 1-1. I/O States During Programming Window



6. Click OK to return to the FlashPoint – Programming File Generator window.

Note: I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

© 2026 Microchip Technology Inc. and its subsidiaries

2. SmartFusion DC and Switching Characteristics (Ask a Question)

2.1. General Specifications (Ask a Question)

2.1.1. Operating Conditions (Ask a Question)

Stresses beyond the operating conditions listed in Table 2-1 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in Table 2-3 is not implied.

Table 2-1. Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPP	Programming voltage	–0.3 to 3.75	V
VCCPLLx	Analog power supply (PLL)	–0.3 to 1.65	V
VCCFPGAIOBx	DC FPGA I/O buffer supply voltage	–0.3 to 3.75	V
VCCMSSIOBx	DC MSS I/O buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3V to 3.6V (when I/O hot insertion mode is enabled) –0.3V to (VCCxxxxIOBx + 1V) or 3.6V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
VCC33A	Analog clean 3.3V supply to the analog circuitry	–0.3 to 3.75	V
VCC33ADCx	Analog 3.3V supply to ADC	–0.3 to 3.75	V
VCC33AP	Analog clean 3.3V supply to the charge pump	–0.3 to 3.75	V
VCC33SDDx	Analog 3.3V supply to the sigma-delta DAC	–0.3 to 3.75	V
VAREFx	Voltage reference for ADC	1.0 to 3.75	V
VCCRCOSC	Analog supply to the integrated RC oscillator	–0.3 to 3.75	V
VDDBAT	External battery supply	–0.3 to 3.75	V
VCCMAINXTAL	Analog supply to the main crystal oscillator	–0.3 to 3.75	V
VCCLPXTAL	Analog supply to the low power 32 kHz crystal oscillator	–0.3 to 3.75	V
VCCENVM	Embedded nonvolatile memory supply	–0.3 to 1.65	V
VCCESRAM	Embedded SRAM supply	–0.3 to 1.65	V
VCC15A	Analog 1.5V supply to the analog circuitry	–0.3 to 1.65	V
VCC15ADCx	Analog 1.5V supply to the ADC	–0.3 to 1.65	V
T_{STG}[1]	Storage temperature	–65 to +150	°C
T_J[1]	Junction temperature	125	°C

Notes:

1. For flash programming and retention maximum limits, refer to Table 2-4. For recommended operating conditions, refer to Table 2-3.
2. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 2-5.

VCCMAINXTAL[5]	Analog supply to the main crystal oscillator		3.15 to 3.45	V
VCCLPXTAL[5]	Analog supply to the low power 32 KHz crystal oscillator		3.15 to 3.45	V
VCCENVM	Embedded nonvolatile memory supply		1.425 to 1.575	V
VCCESRAM	Embedded SRAM supply		1.425 to 1.575	V
VCC15A[2]	Analog 1.5V supply to the analog circuitry		1.425 to 1.575	V
VCC15ADCx[2]	Analog 1.5V supply to the ADC		1.425 to 1.575	V

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. The following 1.5V supplies should be connected together while following proper noise filtering practices: VCC, VCC15A, and VCC15ADCx.
3. VPP can be left floating during operation (not programming mode).
4. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-19. VCCxxxxIOBx should be at the same voltage within a given I/O bank.
5. The following 3.3V supplies should be connected together while following proper noise filtering practices: VCC33A, VCC33ADCx, VCC33AP, VCC33SDDx, VCCMAINXTAL, and VCCLPXTAL.

Table 2-4. Embedded Flash Programming, Storage and Operating Limits

Product Grade	Storage Temperature	Element	Grade Programming Cycles	Retention
Military	Max. T_J = 125 °C	Embedded Flash	< 1,000	6 years
			< 10,000	3 years
			< 15,000	1.5 years

Figure 2-1. High Temperature Data Retention (HTR) for FPGA/FlashROM

Tj (°C)	HTR Lifetime (yrs)
70	102.7
85	43.8
100	20.0
105	15.6
110	12.3
115	9.7
120	7.7
125	6.2
130	5.0
135	4.0
140	3.3
145	2.7
150	2.2

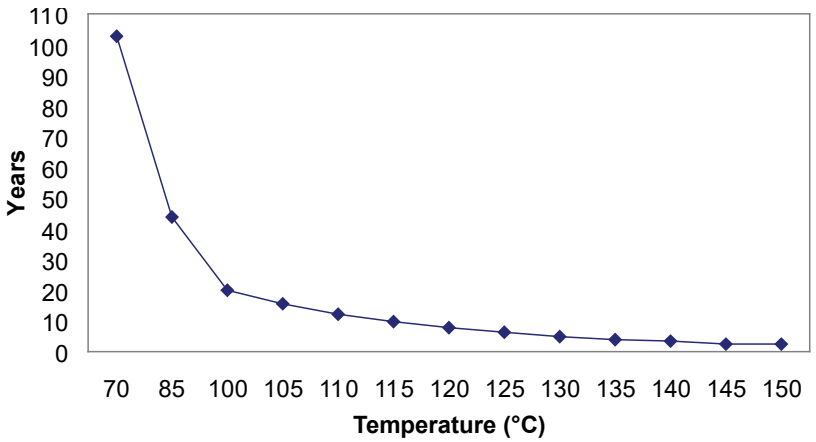

Table 2-5. Overshoot and Undershoot Limits [1]

VCCxxxxIOBx	Average VCCxxxxIOBx–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle[1]	Maximum Overshoot/ Undershoot (125°C)
2.7V or less	10%	0.72V
	5%	0.82V
3V	10%	0.72V
	5%	0.81V
3.3V	10%	0.69V
	5%	0.70V
3.6V	10%	—
	5%	—

Notes:

1. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15V.
2. This table does not provide PCI overshoot/undershoot limits.

© 2026 Microchip Technology Inc. and its subsidiaries

2.1.2. Power Supply Sequencing Requirement (Ask a Question)

SmartFusion cSoCs have an on-chip 1.5V regulator, but usage of an external 1.5V supply is also allowed while the on-chip regulator is disabled. In that case, the 3.3V supplies (VCC33A and so on) should be powered before 1.5V (VCC and so on) supplies. The 1.5V supplies should be enabled only after 3.3V supplies reach a value higher than 2.7V.

2.1.3. I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Military) (Ask a Question)

Sophisticated power-up management circuitry is designed into every SmartFusion cSoC. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 2-2.

There are five regions to consider during power-up.

SmartFusion I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCxxxxIOBx are above the minimum specified trip points (Figure 2-2).
2. VCCxxxxIOBx > VCC – 0.75V (typical)
3. Chip is in the SoC Mode.

VCCxxxxIOBx Trip Point:

- Ramping up: 0.6V < trip_point_up < 1.2V
- Ramping down: 0.5V < trip_point_down < 1.1V

VCC Trip Point:

- Ramping up: 0.6V < trip_point_up < 1.1V
- Ramping down: 0.5V < trip_point_down < 1V

VCC and VCCxxxxIOBx ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCxxxxIOBx.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

2.1.3.1. PLL Behavior at Brownout Condition (Ask a Question)

The Microchip SoC Products Group recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLLx exceed brownout activation levels. The VCC activation level is specified as 1.1V worst-case (see Figure 2-2 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75V ± 0.25V), the PLL output lock signal goes low and/or the output clock is lost. Refer to the “Power-Up/-Down Behavior of Low Power Flash Devices” chapter of the ProASIC3 FPGA Fabric User’s Guide for information on clock and lock recovery.

2.1.3.2. Internal Power-Up Activation Sequence (Ask a Question)

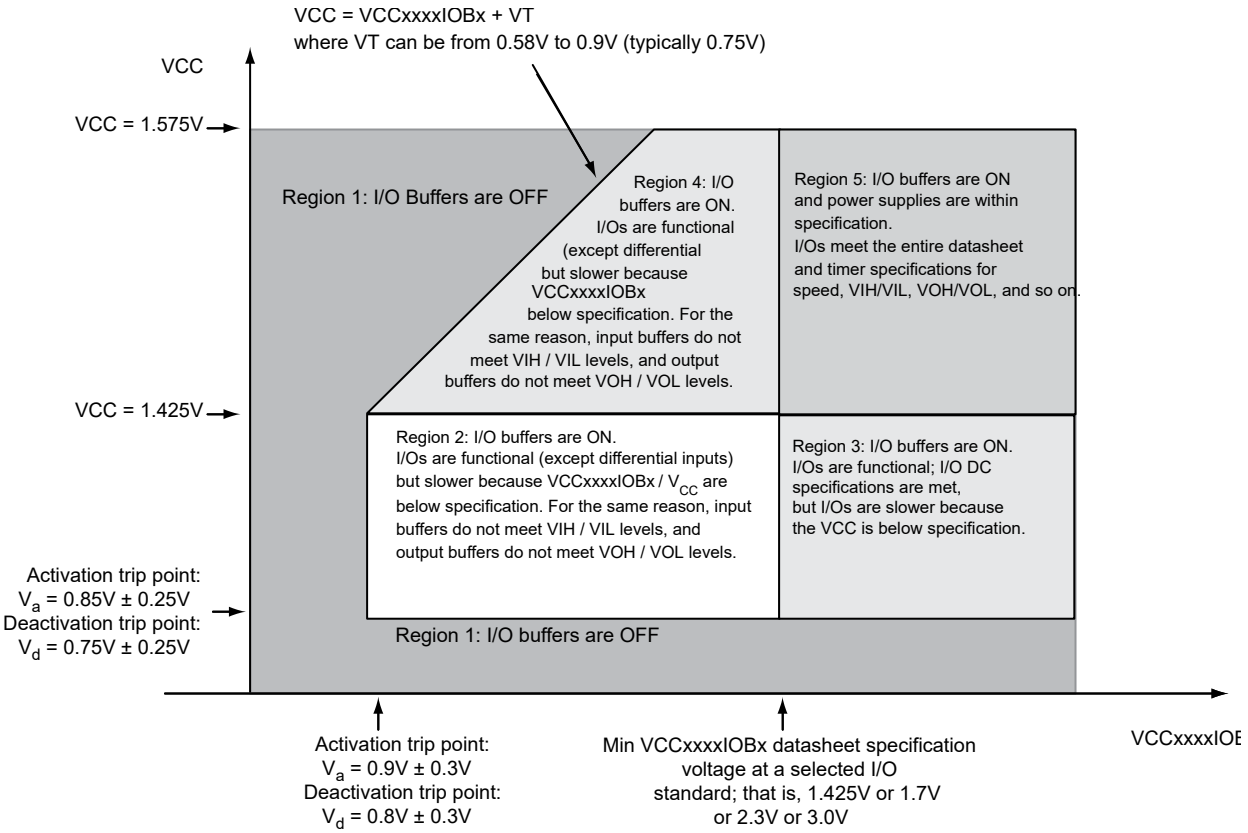
Figure 2-2. I/O State as a Function of VCCxxxxIOBx and VCC Voltage Levels



2.1.4. Thermal Characteristics (Ask a Question)

2.1.4.1. Introduction (Ask a Question)

The temperature variable in the SoC Products Group Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption will cause the chip's junction temperature to be higher than the ambient, case, or board temperatures. EQ 1 through EQ 3 give the relationship between thermal resistance, temperature gradient, and power.

Figure 2-3. EQ 1

$$\theta_{JA} = \frac{T_J - \theta_A}{P}$$

Figure 2-4. EQ 2

$$\theta_{JB} = \frac{T_J - T_B}{P}$$

Figure 2-5. EQ 3

$$\theta_{JC} = \frac{T_J - T_C}{P}$$

where

© 2026 Microchip Technology Inc. and its subsidiaries

- θ_{JA} = Junction-to-air thermal resistance
- θ_{JB} = Junction-to-board thermal resistance
- θ_{JC} = Junction-to-case thermal resistance
- T_J = Junction temperature
- T_A = Ambient temperature
- T_B = Board temperature (measured 1.0 mm away from the package edge)
- T_C = Case temperature
- P = Total power dissipated by the device

Table 2-6. Package Thermal Resistance

Product	θ_{JA}			θ_{JC}	θ_{JB}	Units
	Still Air	1.0 m/s	2.5 m/s			
A2F060[1]-FG256	36.9	31.1	29.4	TBD	23.7	°C/W
A2F500-FG256	26.2	20.6	18.9	TBD	13.2	°C/W
A2F500-FG484	21.9	18.6	16.4	7.5	11	°C/W

Note:

1. Device A2F060 is discontinued.

2.1.4.2. Theta-JA (Ask a Question)

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in actual performance of the product. It should be used with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation showing the maximum power dissipation allowed for the A2F500-FG484 package under forced convection of 1.0 m/s and 75 °C ambient temperature is as follows:

Figure 2-6. EQ 4

$$\text{Maximum Power Allowed} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

where:

- θ_{JA} = 18.6 °C/W (taken from Table 2-6.)
- T_A = 75.00 °C

Figure 2-7. EQ 5

$$\text{Maximum Power Allowed} = \frac{100.00°C - 75.00°C}{18.6°C/W} = 1.61\ W$$

The power consumption of a device can be calculated using the Microchip SoC Products Group power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package. If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink can be attached on top of the case, or the airflow inside the system must be increased.

2.1.4.3. Theta-JB (Ask a Question)

Junction-to-board thermal resistance (θ_{JB}) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal

© 2026 Microchip Technology Inc. and its subsidiaries

resistance from junction to board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5 mm away from the package edge.

2.1.4.4. Theta-JC (Ask a Question)

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks. Constant temperature is applied to the surface in consideration and acts as a boundary condition. This only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration.

2.1.4.5. Calculation for Heat Sink (Ask a Question)

For example, in a design implemented in an A2F500-FG484 package with 2.5 m/s airflow, the power consumption value using the power calculator is 3W. The user-dependent T_a and T_j are given as follows:

T_J = 100.00 °C

T_A = 70.00 °C

From the datasheet:

θ_{JA} = 16.4 °C/W

θ_{JC} = 7.5 °C/W

Figure 2-8. EQ 6

$$P = \frac{T_J - T_A}{\theta_{JA}} = \frac{100°C - 70°C}{16.4\ W} = 1.82\ W$$

The 1.82 W power is less than the required 3.00 W. The design therefore requires a heat sink, or the airflow where the device is mounted should be increased. The design's total junction-to-air thermal resistance requirement can be estimated by Calculation for Heat Sink:

Figure 2-9. EQ 7

$$\theta_{JA(total)} = \frac{T_J - T_A}{P} = \frac{100°C - 70°C}{3.00\ W} = 10.00°C/W$$

Determining the heat sink's thermal performance proceeds as follows:

Figure 2-10. EQ 8

$$\theta_{JA(TOTAL)} = \theta_{JC} + \theta_{CS} + \theta_{SA}$$

where:

θ_{JA} = 0.37°C/W

= Thermal resistance of the interface material between the case and the heat sink, usually provided by the thermal interface manufacturer

θ_{SA} = Thermal resistance of the heat sink in °C/W

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 2-11. EQ 9

$$\theta_{SA} = \theta_{JA(TOTAL)} - \theta_{JC} - \theta_{CS}$$

$$\theta_{SA} = 10°C/W - 7.5°C/W - 0.37°C/W = 2.5°C/W$$

A heat sink with a thermal resistance of 2.5 °C/W or better should be used. Thermal resistance of heat sinks is a function of airflow. The heat sink performance can be significantly improved with increased airflow.

Carefully estimating thermal resistance is important in the long-term reliability of an FPGA. Design engineers should always correlate the power consumption of the device with the maximum allowable power dissipation of the package selected for that device.

Note: The junction-to-air and junction-to-board thermal resistances are based on JEDEC standard (JESD-51) and assumptions made in building the model. It may not be realized in actual application and therefore should be used with a degree of caution. Junction-to-case thermal resistance assumes that all power is dissipated through the case.

2.1.4.6. Temperature and Voltage Derating Factors (Ask a Question)

Table 2-7. Temperature and Voltage Derating Factors for Timing Delays (normalized to T_J = 125 °C, worst-case VCC = 1.425V)

Array Voltage VCC (V)	Junction Temperature (°C)							
	–55 °C	–40 °C	0 °C	25 °C	70 °C	85 °C	100 °C	125 °C
1.425	0.81	0.82	0.87	0.89	0.94	0.96	0.97	1.00
1.500	0.76	0.78	0.82	0.84	0.89	0.91	0.92	0.95
1.575	0.73	0.75	0.79	0.81	0.86	0.87	0.89	0.91

2.2. Calculating Power Dissipation (Ask a Question)

2.2.1. Quiescent Supply Current (Ask a Question)

Table 2-8. Power Supplies Configuration

Modes and Power Supplies	VCCxxxxIOBx VCCFPGAIOBx VCCMSSIOBx	VCC33A / VCC33ADCx VCC33AP/ VCC33SDDx VCCMAINXTAL/ VCCLPXTAL	VCC/ VCC15A/ VCC15ADCx VCCPLLx, VCCENVM, VCCESRAM	VDDBAT	VCCRCOSC	VJTAG	VPP	eNVM (reset/ off)	LPXTAL (enable / disable)	MAINXTAL (enable/ disable)

2.2.4. Power Calculation Methodology (Ask a Question)

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in the Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs/CCCs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- The number of eNVM blocks used in the design
- The analog block used in the design, including the temperature monitor, current monitor, ABPS, sigma-delta DAC, comparator, low power crystal oscillator, RC oscillator and the main crystal oscillator
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in Table 2-17.
- Enable rates of output buffers—guidelines are provided for typical applications in Table 2-18.
- Read rate and write rate to the memory—guidelines are provided for typical applications in Table 2-18.
- Read rate to the eNVM blocks

The calculation should be repeated for each clock domain defined in the design.

2.2.4.1. Methodology (Ask a Question)

2.2.4.1.1. Total Power Consumption—P_{TOTAL} (Ask a Question)

SoC Mode, Standby Mode, and Time Keeping Mode

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

2.2.4.1.2. Total Static Power Consumption—P_{STAT} (Ask a Question)

SoC Mode

$P_{STAT} = P_{DC1} + (N_{INPUTS} \times P_{DC7}) + (N_{OUTPUTS} \times P_{DC8}) + (N_{PLLS} \times P_{DC9})$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{PLLS} is the number of PLLs available in the device.

© 2026 Microchip Technology Inc. and its subsidiaries

Standby Mode

$P_{STAT} = P_{DC2}$

Time Keeping Mode

$P_{STAT} = P_{DC3}$

2.2.4.1.3. Total Dynamic Power Consumption—P_{DYN} (Ask a Question)

SoC Mode

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL} + P_{eNVM} + P_{XTL\text{-}OSC} + P_{RC\text{-}OSC} + P_{AB} + P_{LPXTAL\text{-}OSC} + P_{MSS}$

Standby Mode

$P_{DYN} = P_{RC\text{-}OSC} + P_{LPXTAL\text{-}OSC}$

Time Keeping Mode

$P_{DYN} = P_{LPXTAL\text{-}OSC}$

2.2.4.1.4. Global Clock Dynamic Contribution—P_{CLOCK} (Ask a Question)

SoC Mode

$P_{CLOCK} = (P_{AC1} + N_{SPINE} \times P_{AC2} + N_{ROW} \times P_{AC3} + N_{S\text{-}CELL} \times P_{AC4}) \times F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Device Architecture" chapter of the SmartFusion FPGA Fabric User's Guide.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Device Architecture" chapter of the SmartFusion FPGA Fabric User's Guide.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

Standby Mode and Time Keeping Mode

$P_{CLOCK} = 0W$

2.2.4.1.5. Sequential Cells Dynamic Contribution—$P_{S\text{-}CELL}$ (Ask a Question)

SoC Mode

$P_{S\text{-}CELL} = N_{S\text{-}CELL} \times (P_{AC5} + (\alpha_1/2) \times P_{AC6}) \times F_{CLK}$

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-17.

F_{CLK} is the global clock signal frequency.

Standby Mode and Time Keeping Mode

$P_{S\text{-}CELL} = 0W$

2.2.4.1.6. Combinatorial Cells Dynamic Contribution—$P_{C\text{-}CELL}$ (Ask a Question)

SoC Mode

$P_{C\text{-}CELL} = N_{C\text{-}CELL} \times (\alpha_1 / 2) \times P_{AC7} \times F_{CLK}$

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-17.

F_{CLK} is the global clock signal frequency.

Standby Mode and Time Keeping Mode

© 2026 Microchip Technology Inc. and its subsidiaries

$P_{C\text{-}CELL}$ = 0W

2.2.4.1.7. Routing Net Dynamic Contribution—P_{NET} (Ask a Question)

SoC Mode

$P_{NET} = (N_{S\text{-}CELL} + N_{C\text{-}CELL}) \times (\alpha_1/2) \times P_{AC8} \times F_{CLK}$

$N_{S\text{-}CELL}$ is the number VersaTiles used as sequential modules in the design.

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-17.

F_{CLK} is the frequency of the clock driving the logic including these nets.

Standby Mode and Time Keeping Mode

P_{NET} = 0W

2.2.4.1.8. I/O Input Buffer Dynamic Contribution—P_{INPUTS} (Ask a Question)

SoC Mode

$P_{INPUTS} = N_{INPUTS} \times (\alpha2 / 2) \times P_{AC9} \times F_{CLK}$

Where:

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-17.

F_{CLK} is the global clock signal frequency.

Standby Mode and Time Keeping Mode

P_{INPUTS} = 0W

2.2.4.1.9. I/O Output Buffer Dynamic Contribution—$P_{OUTPUTS}$ (Ask a Question)

SoC Mode

$P_{OUTPUTS} = N_{OUTPUTS} \times (\alpha_2 / 2) \times \beta_1 \times P_{AC10} \times F_{CLK}$

Where:

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-17.

β_1 is the I/O buffer enable rate—guidelines are provided in Table 2-18.

F_{CLK} is the global clock signal frequency.

Standby Mode and Time Keeping Mode

$P_{OUTPUTS}$ = 0W

2.2.4.1.10. FPGA Fabric SRAM Dynamic Contribution—P_{MEMORY} (Ask a Question)

SoC Mode

$P_{MEMORY} = (N_{BLOCKS} \times P_{AC11} \times \beta_2 \times F_{READ\text{-}CLOCK}) + (N_{BLOCKS} \times P_{AC12} \times \beta_3 \times F_{WRITE\text{-}CLOCK})$

Where:

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ\text{-}CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations—guidelines are provided in Table 2-18.

β_3 the RAM enable rate for write operations—guidelines are provided in Table 2-18.

$F_{WRITE\text{-}CLOCK}$ is the memory write clock frequency.

© 2026 Microchip Technology Inc. and its subsidiaries

Standby Mode and Time Keeping Mode

P_{MEMORY} = 0W

2.2.4.1.11. PLL/CCC Dynamic Contribution—P_{PLL} (Ask a Question)

SoC Mode

$P_{PLL} = P_{AC13} \times F_{CLKOUT}$

F_{CLKIN} is the input clock frequency.

F_{CLKOUT} is the output clock frequency.[1]

Standby Mode and Time Keeping Mode

P_{PLL} = 0W

2.2.4.1.12. Embedded Nonvolatile Memory Dynamic Contribution—P_{eNVM} (Ask a Question)

SoC Mode

The eNVM dynamic power consumption is a piecewise linear function of frequency.

$P_{eNVM} = N_{eNVM\text{-}BLOCKS} \times \beta_4 \times P_{AC15} \times F_{READ\text{-}eNVM}$ when $F_{READ\text{-}eNVM} \leq 33$ MHz,

$P_{eNVM} = N_{eNVM\text{-}BLOCKS} \times \beta_4 \times (P_{AC16} + P_{AC17} \times F_{READ\text{-}eNVM})$ when $F_{READ\text{-}eNVM} > 33$ MHz

Where:

$N_{eNVM\text{-}BLOCKS}$ is the number of eNVM blocks used in the design.

β_4 is the eNVM enable rate for read operations. Default is 0 (eNVM mainly in idle state).

$F_{READ\text{-}eNVM}$ is the eNVM read clock frequency.

Standby Mode and Time Keeping Mode

P_{eNVM} = 0W

2.2.4.1.13. Main Crystal Oscillator Dynamic Contribution—$P_{XTL\text{-}OSC}$ (Ask a Question)

SoC Mode

$P_{XTL\text{-}OSC} = P_{AC18}$

Standby Mode

$P_{XTL\text{-}OSC}$ = 0W

Time Keeping Mode

$P_{XTL\text{-}OSC}$ = 0W

2.2.4.1.14. Low Power Oscillator Crystal Dynamic Contribution—$P_{LPXTAL\text{-}OSC}$ (Ask a Question)

Operating, Standby, and Time Keeping Mode

$P_{LPXTAL\text{-}OSC} = P_{AC21}$

2.2.4.1.15. RC Oscillator Dynamic Contribution—$P_{RC\text{-}OSC}$ (Ask a Question)

SoC Mode

$P_{RC\text{-}OSC} = P_{AC19A} + P_{AC19B}$

Standby Mode and Time Keeping Mode

$P_{RC\text{-}OSC}$ = 0W

---

[3] The PLL dynamic contribution depends on the input clock frequency, the number of output clock signals generated by the PLL, and the frequency of each output clock. If a PLL is used to generate more than one output clock, include each output clock in the formula output clock by adding its corresponding contribution ($P_{AC14} \times F_{CLKOUT}$ product) to the total PLL contribution.

© 2026 Microchip Technology Inc. and its subsidiaries

2.2.4.1.16. Analog System Dynamic Contribution—P_{AB} (Ask a Question)

SoC Mode

$P_{AB} = P_{AC23} \times N_{TM} + P_{AC24} \times N_{CM} + P_{AC25} \times N_{ABPS} + P_{AC26} \times N_{SDD} + P_{AC27} \times N_{COMP} + P_{ADC} \times N_{ADC} + P_{VR}$

Where:

N_{CM} is the number of current monitor blocks

N_{TM} is the number of temperature monitor blocks

N_{SDD} is the number of sigma-delta DAC blocks

N_{ABPS} is the number of ABPS blocks

N_{ADC} is the number of ADC blocks

N_{COMP} is the number of comparator blocks

$P_{VR} = P_{AC28}$

$P_{ADC} = P_{AC20A} + P_{AC20B}$

2.2.4.1.17. Microcontroller Subsystem Dynamic Contribution—P_{MSS} (Ask a Question)

SoC Mode

$P_{MSS} = P_{AC22}$

2.2.4.2. Guidelines (Ask a Question)

2.2.4.2.1. Toggle Rate Definition (Ask a Question)

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that the net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100%, as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - ...
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . 0.78125%) / 8.

2.2.4.2.2. Enable Rate Definition (Ask a Question)

Output enable rate is the average percentage of time during which tristate outputs are enabled. When non-tristate output buffers are used, the enable rate should be 100%.

Table 2-17. Toggle Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-18. Enable Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
β_1	I/O output buffer enable rate	Toggle rate of the logic driving the output buffer
β_2	FPGA fabric SRAM enable rate for read operations	12.5%

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-18. Enable Rate Guidelines Recommended for Power Calculation (continued)

Component	Definition	Guideline
β_3	FPGA fabric SRAM enable rate for write operations	12.5%
β_4	eNVM enable rate for read operations	< 5%

2.3. User I/O Characteristics (Ask a Question)

2.3.1. Timing Model (Ask a Question)

Figure 2-12. Timing Model

	8 mA	55	66
	12 mA	55	66
3.3V PCI/PCI-X	Per PCI/PCI-X specification	109	103

Note:

1. T_J = 100 °C.

Table 2-31. I/O Short Currents IOSH/IOSL Applicable to MSS I/O Banks

	Drive Strength	IOSL (mA)[1]	IOSH (mA)[1]
3.3V LVTTL / 3.3V LVCMOS	8 mA	54	51
2.5V LVCMOS	8 mA	37	32
1.8V LVCMOS	4 mA	22	17
1.5V LVCMOS	2 mA	16	13

Note:

1. T_J = 100 °C

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3V, 12 mA I/O setting, which is the worst case for this type of analysis.

© 2026 Microchip Technology Inc. and its subsidiaries

For example, at 100°C, the short current condition would have to be sustained for more than 2200 operation hours to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 2-32. Duration of Short Circuit Event before Failure

Temperature	Time before Failure
–40 °C	> 20 years
0 °C	> 20 years
25 °C	> 20 years
70 °C	5 years
85 °C	2 years
100 °C	6 months
125 °C	1 month

Table 2-33. Schmitt Trigger Input Hysteresis—Hysteresis Voltage Value (typical) for Schmitt Mode Input Buffers

Input Buffer Configuration	Hysteresis Value (typical)
3.3V LVTTL / LVCMOS / PCI / PCI-X (Schmitt trigger mode)	240 mV
2.5V LVCMOS (Schmitt trigger mode)	140 mV
1.8V LVCMOS (Schmitt trigger mode)	80 mV
1.5V LVCMOS (Schmitt trigger mode)	60 mV

Table 2-34. I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS	No requirement	10 ns[1]	20 years (110 °C)
LVDS/B-LVDS/ M-LVDS/LVPECL	No requirement	10 ns[1]	10 years (100 °C)

Note:

1. The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microchip SoC Products Group recommends signal integrity evaluation/ characterization of the system to ensure that there is no excessive noise coupling into input signals.

2.3.4. Single-Ended I/O Characteristics (Ask a Question)

2.3.4.1. 3.3V LVTTL/3.3V LVCMOS (Ask a Question)

Low-Voltage Transistor–Transistor Logic (LVTTL) is a general-purpose standard (EIA/JESD) for 3.3V applications. It uses an LVTTL input buffer and push-pull output buffer.

Table 2-35. Minimum and Maximum DC Output Levels, 3.3V LVTTL/ 3.3V LVCMOS Applicable to FPGA I/O Banks

	VOL	VOL	VOH	VOH	IOL	IOH	IOSL	IOSH

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 for derating values.

2.3.5. Differential I/O Characteristics (Ask a Question)

2.3.5.1. Physical Implementation (Ask a Question)

Configuration of the I/O modules as a differential pair is handled by SoC Products Group Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

2.3.5.2. LVDS (Ask a Question)

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in the following figure. The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, SmartFusion cSoCs also support bus LVDS structure and multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

Figure 2-21. LVDS Circuit Diagram and Board-Level Implementation

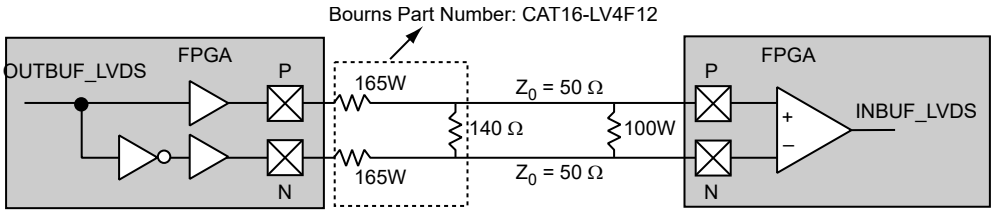

Table 2-64. LVDS Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCFPGAIOBx	Supply voltage	2.375	2.5	2.625	V

Table 2-64. LVDS Minimum and Maximum DC Input and Output Levels (continued)

DC Parameter	Description	Min.	Typ.	Max.	Units
VOL	Output low voltage	0.9	1.075	1.25	V
VOH	Output high voltage	1.25	1.425	1.6	V
I_{OL}[1]	Output lower current	0.65	0.91	1.16	mA
I_{OH}[1]	Output high current	0.65	0.91	1.16	mA
VI	Input voltage	0	—	2.925	V
I_{IH}[2]	Input high leakage current	—	—	15	µA
I_{IL}[2]	Input low leakage current	—	—	15	µA
V_{ODIFF}	Differential output voltage	250	350	450	mV
V_{OCM}	Output common mode voltage	1.125	1.25	1.375	V
V_{ICM}	Input common mode voltage	0.05	1.25	2.35	V
V_{IDIFF}	Input differential voltage	100	350		mV

Notes:

1. IOL / IOH defined by VODIFF / (resistor network).
2. Currents are measured at 125 °C junction temperature.

Table 2-65. AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point[1] (V)	VREF (typ.) (V)
1.075	1.325	Cross point	—

Note:

1. Measuring point = Vtrip. See Table 2-22 for a complete table of trip points.

2.3.5.2.1. Timing Characteristics (Ask a Question)

Table 2-66. LVDS Worst Military-Case Conditions: T_J = 125 °C, Worst-Case VCC = 1.425V, Worst-Case VCCFPGAIOBx = 2.3V Applicable to FPGA I/O Banks, I/O Assigned to EMC I/O Pins

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	Units
Std.	0.62	1.96	0.04	1.63	ns
–1	0.52	1.63	0.03	1.36	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 2-7 for derating values.

2.3.5.3. B-LVDS/M-LVDS (Ask a Question)

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. SoC Products Group LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using SoC Products Group LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in the following figure. The input and output buffer delays are available in the LVDS section in Table 2-66.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case military operating conditions, at the farthest receiver: R_S = 60Ω and R_T = 70Ω, given Z_0 = 50Ω (2 in) and Z_{stub} = 50Ω (~1.5 in).

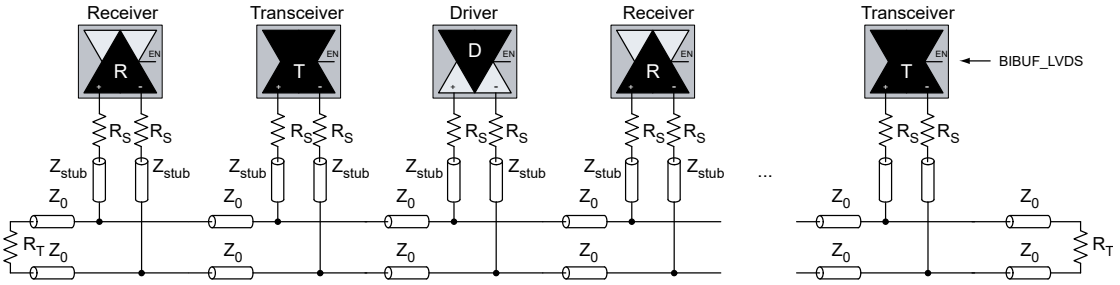
Figure 2-22. B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers



2.3.5.4. LVPECL (Ask a Question)

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in the following figure. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Figure 2-23. LVPECL Circuit Diagram and Board-Level Implementation

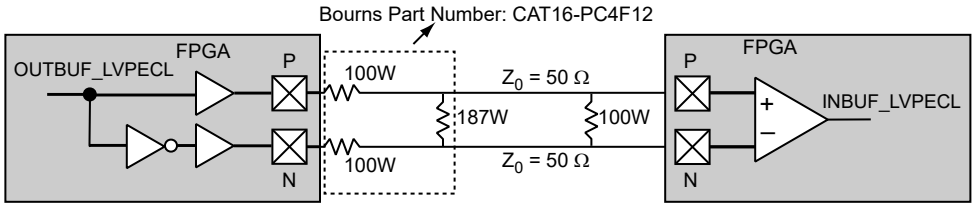


Table 2-67. Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units
VCCFPGAIOBx	Supply Voltage	3.0		3.3		3.6		V
VOL	Output Low Voltage	0.96	1.27	1.06	1.43	1.30	1.57	V
VOH	Output High Voltage	1.8	2.11	1.92	2.28	2.13	2.41	V
VIL, VIH	Input Low, Input High Voltages	0	3.6	0	3.6	0	3.6	V

t_{REMCLR}	Asynchronous Clear Removal Time for the Core Register	0.00	0.00	ns

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-80. Register Delays Worst Military-Case Conditions: T_J = 125 °C, Worst-Case VCC = 1.425V (continued)

Parameter	Description	–1	Std.	Units
t_{RECCLR}	Asynchronous Clear Recovery Time for the Core Register	0.24	0.28	ns
t_{REMPRE}	Asynchronous Preset Removal Time for the Core Register	0.00	0.00	ns
t_{RECPRE}	Asynchronous Preset Recovery Time for the Core Register	0.24	0.28	ns
t_{WCLR}	Asynchronous Clear Minimum Pulse Width for the Core Register	0.22	0.26	ns
t_{WPRE}	Asynchronous Preset Minimum Pulse Width for the Core Register	0.22	0.26	ns
t_{CKMPWH}	Clock Minimum Pulse Width High for the Core Register	0.32	0.38	ns
t_{CKMPWL}	Clock Minimum Pulse Width Low for the Core Register	0.36	0.42	ns

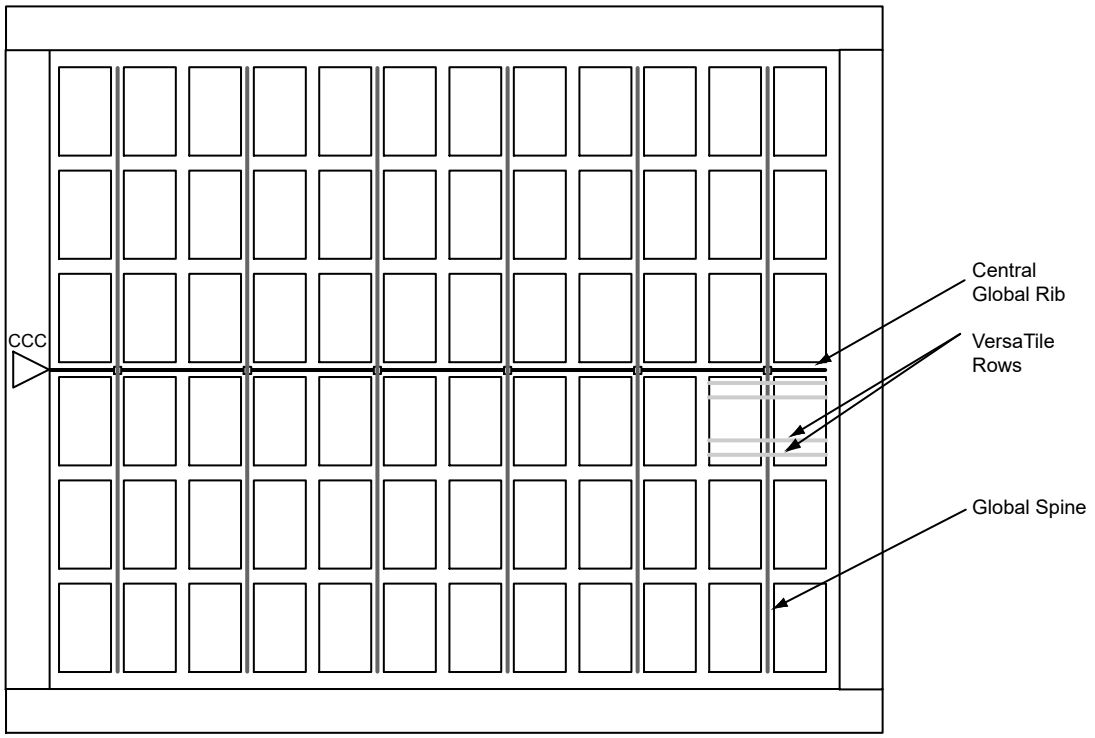
Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 for derating values.

2.5. Global Resource Characteristics (Ask a Question)

2.5.1. A2F500 Clock Tree Topology (Ask a Question)

Clock delays are device-specific. Following figure is an example of a global tree used for clock routing. The global tree presented in the following figure is driven by a CCC located on the west side of the A2F500 device. It is used to drive all D-flip-flops in the device.

Figure 2-37. Example of Global Tree Use in an A2F500 Device for Clock Routing



2.5.2. Global Tree Timing Characteristics (Ask a Question)

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the Clock Conditioning Circuits. Table 2-81 through Table 2-81 present minimum and maximum global clock delays for the SmartFusion cSoCs. Minimum and maximum delays are measured with minimum and maximum loading.

© 2026 Microchip Technology Inc. and its subsidiaries

2.5.2.1. Timing Characteristics (Ask a Question)

Table 2-81. A2F500 Global Resource Worst Military-Case Conditions: T_J = 125 °C, VCC = 1.425V

Parameter	Description	–1		Std.		Units
		Min.[1]	Max.[2]	Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.61	1.81	1.93	2.17	ns
t_{RCKH}	Input High Delay for Global Clock	1.60	1.85	1.92	2.21	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.95	—	1.12	—	ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.93	—	1.09	—	ns
t_{RCKSW}	Maximum Skew for Global Clock	—	0.25	—	0.30	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage-supply levels, refer to Table 2-7 for derating values.

Table 2-82. A2F060[4] Global Resource Worst Military-Case Conditions: T_J = 125 °C, VCC = 1.425V

Parameter	Description	–1		Std.		Units
		Min.[1]	Max.[2]	Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	0.78	1.01	0.94	1.21	ns
t_{RCKH}	Input High Delay for Global Clock	0.75	1.03	0.90	1.23	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.95	—	1.12	—	ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.93	—	1.09	—	ns
t_{RCKSW}	Maximum Skew for Global Clock	—	0.27	—	0.33	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage-supply levels, refer to Table 2-7 for derating values.
4. Device A2F060 is discontinued.

2.6. RC Oscillator (Ask a Question)

The table below describes the electrical characteristics of the RC oscillator.

2.6.1. RC Oscillator Characteristics (Ask a Question)

Table 2-83. Electrical Characteristics of the RC Oscillator

Parameter	Description	Condition	Min.	Typ.	Max.	Units
FRC	Operating frequency	—	—	100	—	MHz

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-83. Electrical Characteristics of the RC Oscillator (continued)

Parameter	Description	Condition	Min.	Typ.	Max.	Units
	Accuracy	Temperature: –40 °C to 100 °C Voltage: 3.3V ± 5%	—	1	—	%
		Temperature: –55 °C to 125 °C Voltage: 3.3V ± 5%	–3	—	3	%
	Output jitter	Period jitter (at 5 K cycles)	—	100	—	ps RMS
		Cycle-to-cycle jitter (at 5 K cycles)	—	100	—	ps RMS
		Period jitter (at 5 K cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply	—	150	—	ps RMS
		Cycle-to-cycle jitter (at 5 K cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply	—	150	—	ps RMS
	Output duty cycle	—	—	50	—	%
IDYNRC	Operating current	3.3V domain	—	1	—	mA
		1.5V domain	—	2	—	mA

2.7. Main and Lower Power Crystal Oscillator (Ask a Question)

The tables below describes the electrical characteristics of the main and low power crystal oscillator.

Table 2-84. Electrical Characteristics of the Main Crystal Oscillator

Parameter	Description	Condition	Min.	Typ.	Max.	Units
	Operating frequency	Using external crystal	0.032	—	20	MHz
		Using ceramic resonator	0.5	—	8	MHz
		Using RC Network	0.032	—	4	MHz

LockControl = 0			1.6	ns
LockControl = 1	—	—	0.8	ns
Output Duty Cycle	48.5	—	5.15	%
Delay Range in Block: Programmable Delay 1[2,3]	0.6	—	5.56	ns
Delay Range in Block: Programmable Delay 2[2,3]	0.025	—	5.56	ns
Delay Range in Block: Fixed Delay[2,3]	—	2.2	—	ns

CCC Output Peak-to-Peak Period Jitter FCCC_OUT [6,7]	Maximum Peak-to-Peak Period Jitter							
	SSO ≤ 2		SSO ≤ 4		SSO ≤ 8		SSO ≤ 16	
	FG/CS	PQ	FG/CS	PQ	FG/CS	PQ	FG/CS	PQ
0.75 MHz to 50 MHz	0.5%	1.6%	0.9%	1.6%	0.9%	1.6%	0.9%	1.8%
50 MHz to 250 MHz	1.75%	3.5%	9.3%	9.3%	9.3%	17.9%	10.0%	17.9%
250 MHz to 350 MHz	2.5%	5.2%	13.0%	13.0%	13.0%	25.0%	14.0%	25.0%

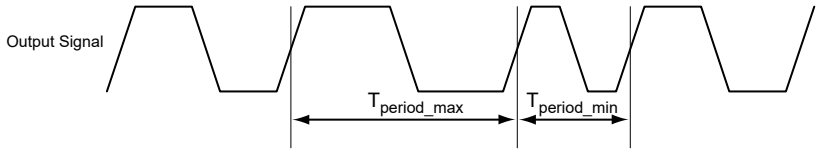
Notes:

1. One of the CCC outputs (GLA0) is used as an MSS clock and is limited to 100 MHz (maximum) by software. Details regarding CCC/PLL are in the “PLLs, Clock Conditioning Circuitry, and On-Chip Crystal Oscillators” chapter of the SmartFusion Microcontroller Subsystem User's Guide.
2. This delay is a function of voltage and temperature. See Table 2-7 for deratings.
3. T_J = 25 °C, VCC = 1.5V
4. When the CCC/PLL core is generated by Microchip core generator software, not all delay values of the specified delay increments are available. Refer to SmartGen online help for more information.

© 2026 Microchip Technology Inc. and its subsidiaries

5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.
6. Measurement done with LVTTL 3.3V 12 mA I/O drive strength and High slew rate. VCC/VCCPLL = 1.425V, VCCI = 3.3V, 20 pF output load. All I/Os are placed outside of the PLL bank.
7. SSOs are outputs that are synchronous to a single clock domain and have their clock-to-out within ± 200 ps of each other.
8. VCO output jitter is calculated as a percentage of the VCO frequency. The jitter (in ps) can be calculated by multiplying the VCO period by the % jitter. The VCO jitter (in ps) applies to CCC_OUT regardless of the output divider settings. For example, if the jitter on VCO is 300 ps, the jitter on CCC_OUT is also 300 ps.

Figure 2-38. Peak-to-Peak Jitter Definition



Note: Peak-to-peak jitter measurements are defined by Tpeak-to-peak = Tperiod_max – Tperiod_min.

2.10. Embedded Nonvolatile Memory Block (eNVM) (Ask a Question)

2.10.1. Electrical Characteristics (Ask a Question)

Following table describes the eNVM maximum performance:

Table 2-90. eNVM Block Timing, Worst Military-Case Conditions: T_J = 125 °C, VCC = 1.425V

Parameter	Description	A2F060[2]		A2F500		Units
		–1	Std.	–1	Std.	
$t_{FMAXCLKeNVM}$	Maximum frequency for clock for the control logic – 5 cycles (5:1:1:1[1])	50	50	50	50	MHz
$t_{FMAXCLKeNVM}$	Maximum frequency for clock for the control logic – 6 cycles (6:1:1:1[1])	50	50	50	50	MHz

Notes:

1. 6:1:1:1 indicates 6 cycles for the first access and 1 each for the next three accesses. 5:1:1:1 indicates 5 cycles for the first access and 1 each for the next three accesses.
2. Device A2F060 is discontinued.

2.11. Embedded FlashROM (eFROM) (Ask a Question)

2.11.1. Electrical Characteristics (Ask a Question)

Following table describes the eFROM maximum performance:

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-91. FlashROM Access Time, Worse Military-Case Conditions: T_J = 125 °C, VCC = 1.425V

Parameter	Description	–1	Std.	Units
F_{max}	Maximum Clock frequency	15.00	15.00	MHz

2.12. JTAG 1532 Characteristics (Ask a Question)

JTAG timing delays do not include JTAG I/Os. To obtain complete JTAG timing, add I/O buffer delays to the corresponding standard selected; refer to the I/O timing characteristics in the User I/O Characteristics for more details.

2.12.1. Timing Characteristics (Ask a Question)

Table 2-92. JTAG 1532 Worst Military-Case Conditions: T_J = 125 °C, Worst-Case VCC = 1.425V

Parameter	Description	–1	Std.	Units
t_{DISU}	Test Data Input Setup Time	0.53	0.63	ns
t_{DIHD}	Test Data Input Hold Time	1.07	1.25	ns
t_{TMSSU}	Test Mode Select Setup Time	0.53	0.63	ns
t_{TMDHD}	Test Mode Select Hold Time	1.07	1.25	ns
t_{TCK2Q}	Clock to Q (data out)	5.33	6.27	ns
t_{RSTB2Q}	Reset to Q (data out)	21.31	25.07	ns
F_{TCKMAX}	TCK Maximum Frequency	26.00	30.59	MHz
$t_{TRSTREM}$	ResetB Removal Time	0.00	0.00	ns
$t_{TRSTREC}$	ResetB Recovery Time	0.21	0.25	ns
$t_{TRSTMPW}$	ResetB Minimum Pulse	TBD	TBD	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 for derating values.

2.13. Programmable Analog Specifications (Ask a Question)

2.13.1. Current Monitor (Ask a Question)

Unless otherwise noted, current monitor performance is specified at 25 °C with nominal power supply voltages, with the output measured using the internal voltage reference with the internal ADC in 12-bit mode and 91 Ksps, after digital compensation. All results are based on averaging over 16 samples.

Table 2-93. Current Monitor Performance Specification

Specification	Test Conditions	Min.	Typical	Max.	Units
Input voltage range (for driving ADC over full range)		0–48	0–50	1–51	mV
Analog gain	From the differential voltage across the input pads to the ADC input	—	50	—	V/V
Input referred offset voltage	Input referred offset voltage	0	0.1	0.5	mV
	–55°C to +125°C	0	0.1	0.5	mV
Gain error	Slope of BFSL vs. 50V/V	—	±0.1	±0.7	% nom.
	–55°C to +125°C	—	—	±0.7	% nom.
Overall Accuracy	Peak error from ideal transfer function, 25 °C	—	±(0.1 +0.25%)	±(0.4 +1.5%)	mV plus % reading
	–55°C to +125°C	—	±(0.1 +0.25%)	±(1.5 +1.5%)	mV plus % reading
Input referred noise	0 VDC input (no output averaging)	0.3	0.4	0.5	mVrms

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-93. Current Monitor Performance Specification (continued)

Specification	Test Conditions	Min.	Typical	Max.	Units
Common-mode rejection ratio	0V to 12VDC common-mode voltage	–86	–87	—	dB
Analog settling time	To 0.1% of final value (with ADC load)				
	From CM_STB (High)	5	—	—	µs
	From ADC_START (High)	5	—	200	µs
Input capacitance		—	8	—	pF
Input biased current	CM[n] or TM[n] pad, –40 °C to +100 °C over maximum input voltage range (plus is into pad)	—	—	—	
	Strobe = 0; IBIAS on CM[n]	—	0	—	µA
	Strobe = 1; IBIAS on CM[n]	—	1	—	µA
	Strobe = 0; IBIAS on TM[n]	—	2	—	µA
	Strobe = 1; IBIAS on TM[n]	—	1	—	µA
Power supply rejection ratio	DC (0–10 KHz)	41	42	—	dB
Incremental operational current monitor power supply current requirements (per current monitor instance, not including ADC or VAREFx)	VCC33A	—	150	—	µA
	VCC33AP	—	140	—	µA
	VCC15A	—	50	—	µA

Note: Under no condition should the TM pad ever be greater than 10 mV above the CM pad. This restriction is applicable only if current monitor is used.

2.13.2. Temperature Monitor (Ask a Question)

Unless otherwise noted, temperature monitor performance is specified with a 2N3904 diode-connected bipolar transistor from National Semiconductor or Infineon Technologies, nominal power supply voltages, with the output measured using the internal voltage reference with the internal ADC in 12-bit mode and 62.5 Ksps. After digital compensation. Unless otherwise noted, the specifications pertain to conditions where the SmartFusion cSoC and the sensing diode are at the same temperature.

Table 2-94. Temperature Monitor Performance Specifications

Specification	Test Conditions	Min.	Typical	Max.	Units
Input diode temperature range	—	–55	—	150	°C
	—	233.2	—	378.15	K
Temperature sensitivity	—	—	2.5	—	mV/K
Intercept	Extrapolated to 0K	—	0	—	V
Input referred temperature offset error	At 25 °C (298.15K)	—	±1	1.5	°C
	At –55°C to +125°C	—	—	2	°C
Gain error	Slope of BFSL vs. 2.5 mV/K	—	±1	2.5	% nom.
Overall accuracy	Peak error from ideal transfer function	—	±2	±3	°C
	At –55°C to +125°C	—	—	±5	°C
Input referred noise	At 25 °C (298.15K) – no output averaging	—	4	—	°C rms
	At –55°C to +125°C	—	—	6.5	°C rms
Output current	Idle mode	—	100	—	µA
	Final measurement phases	—	10	—	µA
Analog settling time	Measured to 0.1% of final value, (with ADC load)				
	From TM_STB (High)	5	—	—	µs
	From ADC_START (High)	5	—	105	µs

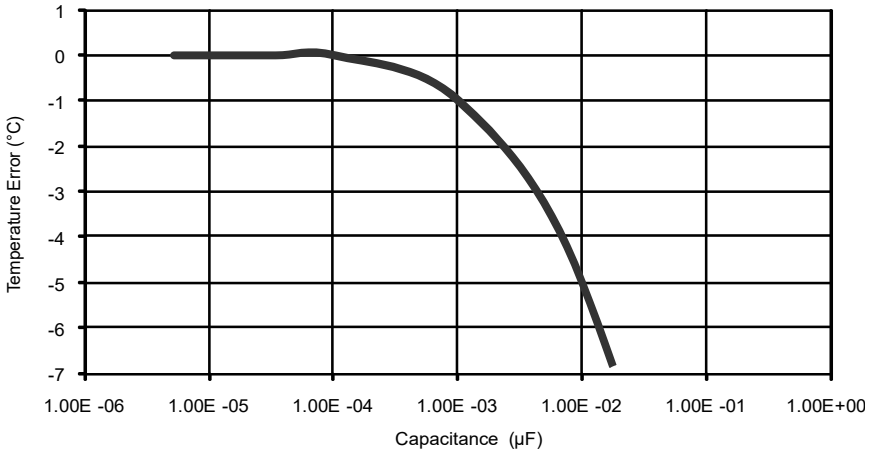
© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-94. Temperature Monitor Performance Specifications (continued)

Specification	Test Conditions	Min.	Typical	Max.	Units
AT parasitic capacitance	—	—	—	500	pF
Power supply rejection ratio	DC (0–10 KHz)	1.2	0.7	—	°C/V
Input referred temperature sensitivity error	Variation due to device temperature (–40 °C to +100 °C). External temperature sensor held constant.	—	0.005	0.008	°C/°C
Temperature monitor (TM) operational power supply current requirements (per temperature monitor instance, not including ADC or VAREFx)	VCC33A	—	200	—	µA
	VCC33AP	—	150	—	µA
	VCC15A	—	50	—	µA

Note: All results are based on averaging over 64 samples.

Figure 2-51. Temperature Error Versus External Capacitance



2.13.3. Analog-to-Digital Converter (ADC) (Ask a Question)

Unless otherwise noted, ADC direct input performance is specified at 25 °C with nominal power supply voltages, with the output measured using the external voltage reference with the internal ADC in 12-bit mode and 500 KHz sampling frequency, after trimming and digital compensation.

Table 2-95. ADC Specifications

Specification	Test Conditions	Min.	Typ.	Max.	Units
Input voltage range (for driving ADC over its full range)		—	2.56	—	V
Gain error		—	±0.4	±0.7	%
	–55°C to +125°C	—	±0.4	±0.7	%
Input referred offset voltage		—	±1	±2	mV
	–55°C to +125°C	—	±1	±4	mV
Integral non-linearity (INL)	RMS deviation from BFSL				
	12-bit mode	—	1.71	—	LSB
	10-bit mode	—	0.60	1.00	LSB
	8-bit mode	—	0.2	0.33	LSB
Differential non-linearity (DNL)	12-bit mode	—	2.4	—	LSB
	10-bit mode	—	0.80	0.94	LSB
	8-bit mode	—	0.2	0.23	LSB
Signal to noise ratio		62	64	—	dB

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-95. ADC Specifications (continued)

Specification	Test Conditions	Min.	Typ.	Max.	Units
Effective number of bits (ENOB) **Figure 2-52.** EQ 10 $ENOB = \frac{SINAD - 1.76\ dB}{6.02\ dB/bit}$	–1 dBFS input				
	12-bit mode 10 KHz	9.9	10	—	Bits
	12-bit mode 100 KHz	9.9	10	—	Bits
	10-bit mode 10 KHz	9.5	9.6	—	Bits
	10-bit mode 100 KHz	9.5	9.6	—	Bits
	8-bit mode 10 KHz	7.8	7.9	—	Bits
	8-bit mode 100 KHz	7.8	7.9	—	Bits
Full power bandwidth	At –3 dB; –1 dBFS input	300	—	—	KHz
Analog settling time	To 0.1% of final value (with 1 KΩ source impedance and with ADC load)	—	2	—	µs
Input capacitance	Switched capacitance (ADC sample capacitor)	—	12	15	pF
	Cs: Static capacitance (Analog-to-Digital Converter (ADC))				
	CM[n] input	—	5	7	pF
	TM[n] input	—	5	7	pF
	ADC[n] input	—	5	7	pF
Input resistance	Rin: Series resistance (Analog-to-Digital Converter (ADC))	—	2	—	KΩ
	Rsh: Shunt resistance, exclusive of switched capacitance effects (Analog-to-Digital Converter (ADC))	10	—	—	MΩ
Input leakage current	–40 °C to +100 °C	—	1	—	µA
Power supply rejection ratio	DC	44	53	—	dB
ADC power supply operational current requirements	VCC33ADCx	—	—	2.5	mA
	VCC15A	—	—	2	mA

Note: All 3.3V supplies are tied together and varied from 3.0V to 3.6V. 1.5V supplies are held constant.

Table 2-96. VAREF Stabilization Time (continued)

VAREF Capacitor Value (µF)	Required Settling Time for 8-Bit and 10-Bit Mode (ms)	Required Settling Time for 12-Bit Mode (ms)
22	635	751
47	1318	1557

2.13.4. Analog Bipolar Prescaler (ABPS) (Ask a Question)

With the ABPS set to its high range setting (GDEC = 00), a hypothetical input voltage in the range –15.36V to +15.36V is scaled and offset by the ABPS input amplifier to match the ADC full range of 0V to 2.56V using a nominal gain of –0.08333V/V. However, due to reliability considerations, the voltage applied to the ABPS input should never be outside the range of –11.5V to +14.4V, restricting the usable ADC input voltage to 2.238V to 0.080V and the corresponding 12-bit output codes to the range of 3581 to 128 (decimal), respectively.

Unless otherwise noted, ABPS performance is specified at 25 °C with nominal power supply voltages, with the output measured using the internal voltage reference with the internal ADC in 12-bit mode and 100 KHz sampling frequency, after trimming and digital compensation; and applies to all ranges.

Table 2-97. ABPS Performance Specifications

Specification	Test Conditions	Min.	Typ.	Max.	Units
Input voltage range (for driving ADC over its full range)	GDEC[1:0] = 11	—	±2.56	—	V
	GDEC[1:0] = 10	—	±5.12	—	V
	GDEC[1:0] = 01	—	±10.24	—	V
	GDEC[1:0] = 00 (limited by maximum rating)	—	See note 1	—	V
Analog gain (from input pad to ADC input)	GDEC[1:0] = 11	—	–0.5	—	V/V
	GDEC[1:0] = 10	—	–0.25	—	V/V
	GDEC[1:0] = 01	—	–0.125	—	V/V
	GDEC[1:0] = 00	—	–0.0833	—	V/V
Gain error		–2.8	–0.4	0.7	%
	–40°C to +100°C	–2.8	–0.4	0.7	%
	–55°C to +125°C	–4	–0.4	4	%
Input referred offset voltage	GDEC[1:0] = 11	–0.31	–0.07	0.31	% FS[1]
	–55°C to +125°C	–1.7	—	1.7	% FS[1]
	GDEC[1:0] = 10	–0.34	–0.07	0.34	% FS[1]
	–55°C to +125°C	–1.6	—	1.6	% FS[1]
	GDEC[1:0] = 01	–0.61	–0.07	0.35	% FS[1]
	–55°C to +125°C	–1.6	—	1.6	% FS[1]
	GDEC[1:0] = 00	–0.39	–0.07	0.35	% FS[1]
	–55°C to +125°C	–1.6	—	1.6	% FS[1]
SINAD		53	56	—	dB
Non-linearity	RMS deviation from BFSL	—	—	0.5	% FS[1]

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-97. ABPS Performance Specifications (continued)

Specification	Test Conditions	Min.	Typ.	Max.	Units
Effective number of bits (ENOB) **Figure 2-54.** EQ 11 $ENOB = \frac{SINAD - 1.76\ dB}{6.02\ dB/bit}$	GDEC[1:0] = 11 (±2.56 range), –1 dBFS input				
	12-bit mode 10 KHz	8.6	9.1	—	Bits
	12-bit mode 100 KHz	8.6	9.1	—	Bits
	10-bit mode 10 KHz	8.5	8.9	—	Bits
	10-bit mode 100 KHz	8.5	8.9	—	Bits
	8-bit mode 10 KHz	7.7	7.8	—	Bits
	8-bit mode 100 KHz	7.7	7.8	—	Bits
Large-signal bandwidth	–1 dBFS input	—	1	—	MHz
Analog settling time	To 0.1% of final value (with ADC load)	—	—	10	µs
Input resistance	—	—	1	—	MΩ
Power supply rejection ratio	DC (0–1 KHz)	38	40	—	dB
ABPS power supply current requirements (not including ADC or VAREFx)	ABPS_EN = 1 (operational mode)				
	VCC33A	—	123	134	µA
	VCC33AP	—	89	94	µA
	VCC15A	—	1	—	µA

Note:

1. FS is full-scale error, defined as the difference between the actual value that triggers the transition to full-scale and the ideal analog full-scale transition value. Full-scale error equals offset error plus gain error. Refer to the Analog-to-Digital Converter chapter of the SmartFusion Programmable Analog User's Guide for more information.

2.13.5. Comparator (Ask a Question)

Unless otherwise specified, performance is specified at 25 °C with nominal power supply voltages.

Table 2-98. Comparator Performance Specifications

Specification	Test Conditions	Min.	Typ.	Max.	Units
Input voltage range	Minimum	—	0	—	V
	Maximum	—	2.56	—	V
Input offset voltage	HYS[1:0] = 00 (no hysteresis)	—	±1	±3	mV
Input bias current	Comparator 1, 3, 5, 7, 9 (measured at 2.56V)	—	40	60	nA
	Comparator 0, 2, 4, 6, 8 (measured at 2.56V)	—	150	300	nA
Input resistance		10	—	—	MΩ
Power supply rejection ratio	DC (0 – 10 KHz)	50	60	—	dB
Propagation delay	100 mV overdrive	—	—	—	—
	HYS[1:0] = 00	—	—	—	—
	(no hysteresis)	—	15	18	ns
	100 mV overdrive	—	—	—	—
	HYS[1:0] = 10	—	—	—	—
	(with hysteresis)	—	25	30	ns

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-98. Comparator Performance Specifications (continued)

Specification	Test Conditions		Min.	Typ.	Max.	Units
Hysteresis (± refers to rising and falling threshold shifts, respectively)	HYS[1:0] = 00	Typical (25 °C)	0	0	±5	mV
		Across all corners (–55°C to +125°C)	0	—	±5	mV
	HYS[1:0] = 01	Typical (25 °C)	±3	± 16	±30	mV
		Across all corners (–55°C to +125°C)	0	—	±36	mV
	HYS[1:0] = 10	Typical (25 °C)	±19	± 31	±48	mV
		Across all corners (–40 °C to +100 °C)	±12	—	±54	mV
		Across all corners (–55°C to +125°C)	±5	—	±54	mV
	HYS[1:0] = 11	Typical (25 °C)	±80	± 105	±190	mV
		Across all corners (–40°C to +100°C)	±80	—	±194	mV
		Across all corners (–55°C to +125°C)	±60	—	±194	mV
Comparator current requirements (per comparator)	VCC33A = 3.3V (operational mode); COMP_EN = 1					
	VCC33A		—	150	165	µA
	VCC33AP		—	140	165	µA
	VCC15A		—	1	15	µA

2.13.6. Analog Sigma-Delta Digital to Analog Converter (DAC) (Ask a Question)

Unless otherwise noted, sigma-delta DAC performance is specified at 25 °C with nominal power supply voltages, using the internal sigma-delta modulators with 16-bit inputs, HCLK = 100 MHz, modulator inputs updated at a 100 KHz rate, in voltage output mode with an external 160 pF capacitor to ground, after trimming and digital [pre-]compensation.

Table 2-99. Analog Sigma-Delta DAC

Specification	Test Conditions	Min.	Typ.	Max.	Units
Resolution		8	—	24	Bits
Output range		—	0 to 2.56	—	V
	Current output mode	—	0 to 256	—	µA
Output Impedance		6	10	12	KΩ
	Current output mode	10	—	—	MΩ
Output voltage compliance	Current output mode	—	0–3.0	—	V
	–40°C to +100°C	0–2.7	—	0–3.4	V
Gain error	Voltage output mode	—	0.3	±2	%
	–40°C to +100°C	—	0.3	±2	%
	–55°C to +125°C	—	0.3	±6	%
	Current output mode	—	0.3	±2	%
	–40°C to +100°C	—	0.3	±2	%
	–55°C to +125°C	—	0.3	±6	%
Output referred offset	DACBYTE0 = h'00 (8-bit)	—	0.25	±1	mV
	–40°C to +100°C	—	1	±2.5	mV
	Current output mode	—	0.3	±1	µA
	–40°C to +100°C	—	1	±2.5	µA
Integral non-linearity	RMS deviation from BFSL	—	0.1	0.4	% FS[1]
Differential non-linearity		—	0.05	0.4	% FS[1]
Analog settling time		—	Refer to Analog Sigma-Delta Digital to Analog Converter (DAC)	—	µs

© 2026 Microchip Technology Inc. and its subsidiaries

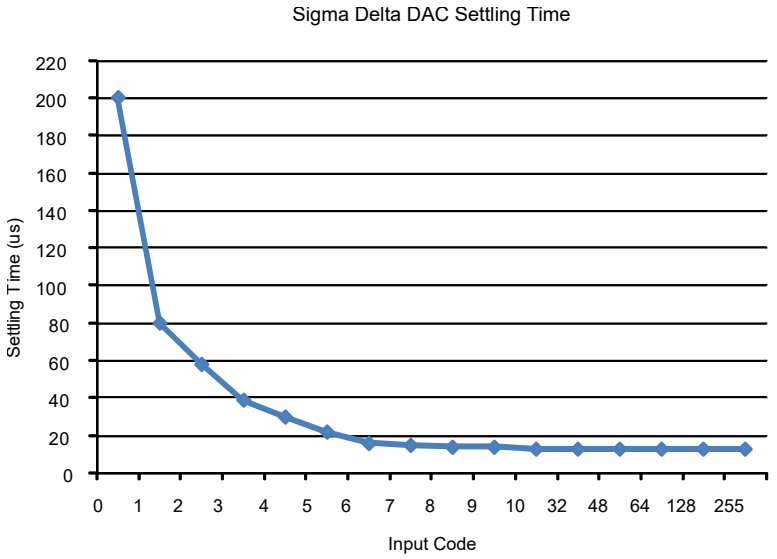
Table 2-99. Analog Sigma-Delta DAC (continued)

Specification	Test Conditions	Min.	Typ.	Max.	Units
Power supply rejection ratio	DC, full scale output	33	34		dB
Sigma-delta DAC power supply current requirements (not including VAREFx)	Input = 0, EN = 1 (operational mode)	—	—	—	
	VCC33SDDx		30	40	µA
	VCC15A		3	5	µA
	Input = Half scale, EN = 1 (operational mode)	—	—		
	VCC33SDDx	—	160	165	µA
	VCC15A	—	33	35	µA
	Input = Full scale, EN = 1 (operational mode)	—	—	—	—
	VCC33SDDx	—	280	285	µA
	VCC15A	—	70	75	µA

Note:

1. FS is full-scale error, defined as the difference between the actual value that triggers the transition to full-scale and the ideal analog full-scale transition value. Full-scale error equals offset error plus gain error. Refer to the Analog-to-Digital Converter chapter of the SmartFusion Programmable Analog User's Guide for more information.

Figure 2-55. Sigma-Delta DAC Setting Time



2.13.7. Voltage Regulator (Ask a Question)

Table 2-100. Voltage Regulator

Symbol	Parameter	Test Conditions		Min.	Typ.	Max.	Unit
VOUT	Output voltage	T_J = 25 °C	—	1.425	1.5	1.575	V
VOS	Output offset voltage	T_J = 25 °C	—	—	11	—	mV
ICC33A	Operation current	T_J = 25 °C	I_{LOAD} = 1 mA	—	3.4	—	mA
			I_{LOAD} = 100 mA	—	11	—	mA
			I_{LOAD} = 0.5 A	—	21	—	mA
ΔVOUT	Load regulation	T_J = 25 °C	I_{LOAD} = 1 mA to 0.5 A	—	5.8	—	mV

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-100. Voltage Regulator (continued)

Symbol	Parameter	Test Conditions		Min.	Typ.	Max.	Unit
ΔVOUT	Line regulation	T_J = 25 °C	VCC33A = 2.97V to 3.63V ILOAD = 1 mA	—	8	—	mV/V
			VCC33A = 2.97V to 3.63V ILOAD= 100 mA	—	8	—	mV/V
			VCC33A = 2.97V to 3.63V I_{LOAD} = 500 mA	—	8	—	mV/V
	Dropout voltage[1]	T_J = 25 °C	ILOAD = 1 mA	—	0.65	—	V
			I_{LOAD} = 100 mA	—	0.84	—	V
			I_{LOAD} = 0.5 A	—	1.35	—	V
IPTBASE	PTBase current	T_J = 25 °C	I_{LOAD} = 1 mA	—	48	—	µA
			I_{LOAD} = 100 mA	—	736	—	µA
			I_{LOAD} = 0.5 A	—	12	—	mA
	Startup time[2]	T_J = 25 °C	—	—	200	—	ms

Notes:

1. Dropout voltage is defined as the minimum VCC33A voltage. The parameter is specified with respect to the output voltage. The specification represents the minimum input-to-output differential voltage required to maintain regulation.
2. Assumes 10 µF.

Figure 2-56. Typical Output Voltage

2.14. Serial Peripheral Interface (SPI) Characteristics (Ask a Question)

This section describes the DC and switching of the SPI interface. Unless otherwise noted, all output characteristics given for a 35 pF load on the pins and all sequential timing characteristics are related to SPI_x_CLK. For timing parameter definitions, see Serial Peripheral Interface (SPI) Characteristics.

Table 2-101. SPI Characteristics Military-Case Conditions: T_J = 125 °C, VDD = 1.425V, –1 Speed Grade (Continued)

Symbol	Description and Condition	A2F060[3]	A2F500	Unit
sp1	SPI_x_CLK minimum period			
	SPI_x_CLK = PCLK/2	20	20	ns
	SPI_x_CLK = PCLK/4	40	40	ns
	SPI_x_CLK = PCLK/8	80	80	ns
	SPI_x_CLK = PCLK/16	0.16	0.16	µs
	SPI_x_CLK = PCLK/32	0.32	0.32	µs
	SPI_x_CLK = PCLK/64	0.64	0.64	µs
	SPI_x_CLK = PCLK/128	1.28	1.28	µs
	SPI_x_CLK = PCLK/256	2.56	2.56	µs
sp2	SPI_x_CLK minimum pulse width high			
	SPI_x_CLK = PCLK/2	10	10	ns
	SPI_x_CLK = PCLK/4	20	20	ns
	SPI_x_CLK = PCLK/8	40	40	ns
	SPI_x_CLK = PCLK/16	0.08	0.08	µs
	SPI_x_CLK = PCLK/32	0.16	0.16	µs
	SPI_x_CLK = PCLK/64	0.32	0.32	µs
	SPI_x_CLK = PCLK/128	0.64	0.64	µs
	SPI_x_CLK = PCLK/256	1.28	1.28	us
sp3	SPI_x_CLK minimum pulse width low			
	SPI_x_CLK = PCLK/2	10	10	ns
	SPI_x_CLK = PCLK/4	20	20	ns
	SPI_x_CLK = PCLK/8	40	40	ns
	SPI_x_CLK = PCLK/16	0.08	0.08	µs
	SPI_x_CLK = PCLK/32	0.16	0.16	µs
	SPI_x_CLK = PCLK/64	0.32	0.32	µs
	SPI_x_CLK = PCLK/128	0.64	0.64	µs
	SPI_x_CLK = PCLK/256	1.28	1.28	µs

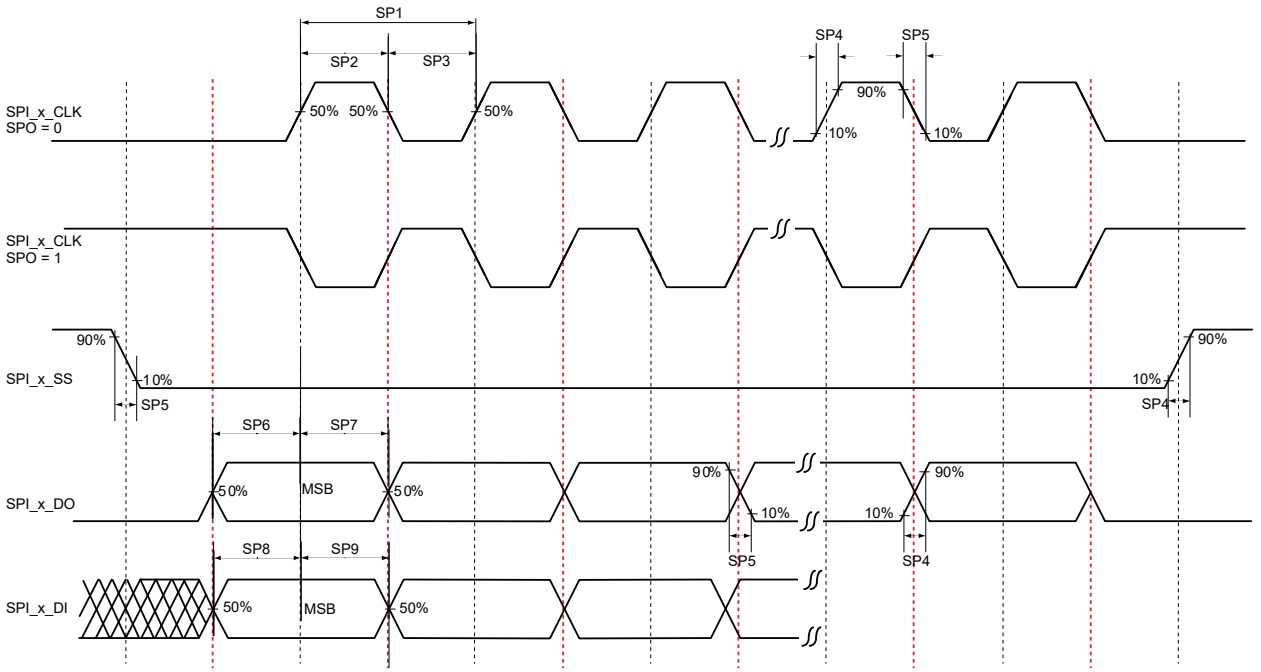
Table 2-101. SPI Characteristics Military-Case Conditions: T_J = 125 °C, VDD = 1.425V, –1 Speed Grade (Continued) (continued)

Symbol	Description and Condition	A2F060[3]	A2F500	Unit
sp4	SPI_x_CLK, SPI_x_DO, SPI_x_SS rise time (10%-90%) [1]	4.7	4.7	ns
sp5	SPI_x_CLK, SPI_x_DO, SPI_x_SS fall time (10%-90%) [1]	3.4	3.4	ns
sp6	Data from master (SPI_x_DO) setup time [2]	1	1	pclk cycles
sp7	Data from master (SPI_x_DO) hold time [2]	1	1	pclk cycles
sp8	SPI_x_DI setup time [1]	1	1	pclk cycles
sp9	SPI_x_DI hold time [2]	1	1	pclk cycles

Notes:

1. These values are provided for a load of 35 pF. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microchip website.
2. For allowable pclk configurations, refer to the Serial Peripheral Interface Controller section in the SmartFusion Microcontroller Subsystem User's Guide.
3. Device A2F060 is discontinued.

Figure 2-58. SPI Timing for a Single Frame Transfer in Motorola Mode (SPH = 1)



2.15. Inter-Integrated Circuit (I^2C) Characteristics (Ask a Question)

This section describes the DC and switching of the I2C interface. Unless otherwise noted, all output characteristics given are for a 100 pF load on the pins. For timing parameter definitions, refer to Inter-Integrated Circuit (I2C) Characteristics.

Table 2-102. I^2C Characteristics Military-Case Conditions: T_J = 125 °C, VDD = 1.425V, –1 Speed Grade (continued)

Parameter	Definition	Condition	Value	Unit
V_{IL}	Minimum input low voltage	—	SeeTable 2-37	—
	Maximum input low voltage	—	See Table 2-37	—
V_{IH}	Minimum input high voltage	—	See Table 2-37	—
	Maximum input high voltage	—	See Table 2-37	—

© 2026 Microchip Technology Inc. and its subsidiaries

Table 2-102. I^2C Characteristics Military-Case Conditions: T_J = 125 °C, VDD = 1.425V, –1 Speed Grade (continued) (continued)

Parameter	Definition	Condition	Value	Unit
V_{OL}	Maximum output voltage low	IOL = 8 mA	See Table 2-37	—
I_{IL}	Input current high	—	See Table 2-37	—
I_{IH}	Input current low	—	See Table 2-37	—
V_{hyst}	Hysteresis of Schmitt trigger inputs	—	See Table 2-33	V
T_{FALL}	Fall time [2]	VIHmin to VILMax, Cload = 400 pF	15.0	ns
		VIHmin to VILMax, Cload = 100 pF	4.0	ns
T_{RISE}	Rise time [2]	VILMax to VIHmin, Cload = 400pF	19.5	ns
		VILMax to VIHmin, Cload = 100pF	5.2	ns
Cin	Pin capacitance	VIN = 0, f = 1.0 MHz	8.0	pF
$R_{pull-up}$	Output buffer maximum pull-down Resistance [1]	—	50	Ω
$R_{pull-down}$	Output buffer maximum pull-up Resistance [1]	—	150	Ω
D_{max}	Maximum data rate	Fast mode	400	Kbps
t_{LOW}	Low period of I2C_x_SCL [3]	—	1	pclk cycles
t_{HIGH}	High period of I2C_x_SCL [3]	—	1	pclk cycles
$t_{HD;STA}$	START hold time [3]	—	1	pclk cycles
$t_{SU;STA}$	START setup time [3]	—	1	pclk cycles
$t_{HD;DAT}$	DATA hold time [3]	—	1	pclk cycles
$t_{SU;DAT}$	DATA setup time [3]	—	1	pclk cycles
$t_{SU;STO}$	STOP setup time [3]	—	1	pclk cycles
t_{FILT}	Maximum spike width filtered	—	50	ns

Notes:

1. These maximum values are provided for information only. Minimum output buffer resistance values depend on VCCxxxxIOBx, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microchip website.
2. These values are provided for a load of 100 pF and 400 pF. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microchip website.
3. For allowable Pclk configurations, refer to the Inter-Integrated Circuit (I^2C) Peripherals section in the SmartFusion Microcontroller Subsystem User's Guide.

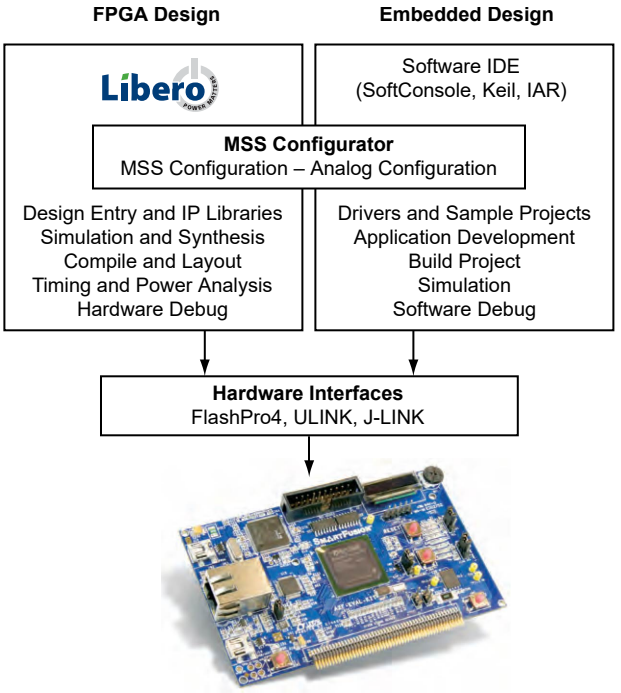
3. SmartFusion Development Tools (Ask a Question)

Designing with SmartFusion cSoCs involves three different types of design: FPGA design, embedded design and analog design. These roles can be filled by three different designers, two designers or even a single designer, depending on company structure and project complexity.

3.1. Types of Design Tools (Ask a Question)

Microchip has developed design tools and flows to meet the needs of these three types of designers so they can work together smoothly on a single project.

Figure 3-1. Three Design Roles



3.1.1. FPGA Design (Ask a Question)

Libero System-on-Chip (SoC) software is Microchip's comprehensive software toolset for designing with all Microchip FPGAs and cSoCs. Libero SoC includes industry-leading synthesis, simulation and debug tools from Synopsys® and Mentor Graphics®, as well as innovative timing and power optimization and analysis.

3.1.2. Embedded Design (Ask a Question)

Microchip offers FREE SoftConsole Eclipse based IDE, which includes the GNU C/C++ compiler and GDB debugger. Microchip also offers evaluation versions of software from Keil and IAR, with full versions available from respective suppliers.

3.1.3. Analog Design (Ask a Question)

The MSS configurator provides graphical configuration for current, voltage and temperature monitors, sample sequencing setup and post-processing configuration, as well as DAC output.

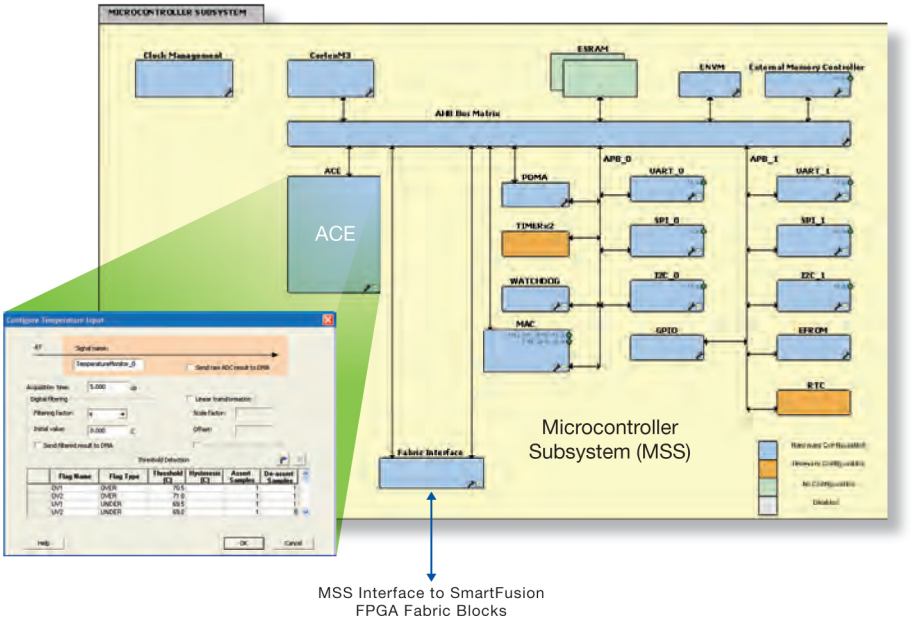
The MSS configurator creates a bridge between the FPGA fabric and embedded designers so device configuration can be easily shared between multiple developers.

The MSS configurator includes the following:

© 2026 Microchip Technology Inc. and its subsidiaries

- A simple configurator for the embedded designer to control the MSS peripherals and I/Os
- A method to import and view a hardware configuration from the FPGA flow into the embedded flow containing the memory map
- Automatic generation of drivers for any peripherals or soft IP used in the system configuration
- Comprehensive analog configuration for the programmable analog components
- Creation of a standard MSS block to be used in SmartDesign for connection of FPGA fabric designs and IP

Figure 3-2. MSS Configurator



3.2. SmartFusion Ecosystem (Ask a Question)

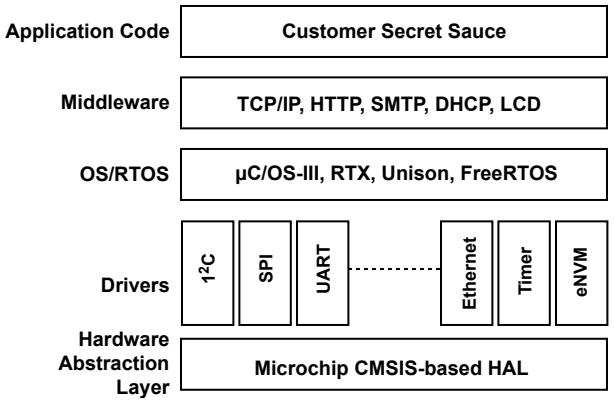
The Microchip SoC Products Group has a long history of supplying comprehensive FPGA development tools and recognizes the benefit of partnering with industry leaders to deliver the optimum usability and productivity to customers. Taking the same approach with processor development, Microchip has partnered with key industry leaders in the microcontroller space to provide the robust SmartFusion ecosystem.

Microchip is partnering with Keil and IAR to provide Software IDE support to SmartFusion system designers. The result is a robust solution that can be easily adopted by developers who are already doing embedded design. The learning path is straightforward for FPGA designers.

Support for the SoC Products Group device and ecosystem resources is represented in the following figure.

© 2026 Microchip Technology Inc. and its subsidiaries

Figure 3-3. SmartFusion Ecosystem



The preceding figure shows the SmartFusion stack with examples of drivers, RTOS, and middleware from Microchip and partners. By leveraging the SmartFusion stack, designers can decide at which level to add their own customization to their design, thus speeding time to market and reducing overhead in the design.

3.2.1. ARM (Ask a Question)

Because an ARM processor was chosen for SmartFusion cSoCs, Microchip's customers can benefit from the extensive ARM ecosystem. By building on Microchip supplied hardware abstraction layer (HAL) and drivers, third party vendors can easily port RTOS and middleware for the SmartFusion cSoC.

- ARM Cortex-M Series Processors
- ARM Cortex-M3 Processor Resource
- ARM Cortex-M3 Technical Reference Manual
- ARM Cortex-M3 Processor Software Development for ARM7TDMI Processor Programmers White Paper

3.2.2. Compile and Debug (Ask a Question)

Microchip's SoftConsole is a free Eclipse-based IDE that enables the rapid production of C and C++ executables for Microchip FPGA and cSoCs using Cortex-M3, Cortex-M1 and Core8051s. For SmartFusion support, SoftConsole includes the GNU C/C++ compiler and GDB debugger. Additional examples can be found on the SoftConsole page:

- Using UART with SmartFusion: SoftConsole Standalone Flow Tutorial
  - Design Files
- Displaying POT Level with LEDs: Libero SoC and SoftConsole Flow Tutorial for SmartFusion
  - Design Files

IAR Embedded Workbench® for ARM/Cortex is an integrated development environment for building and debugging embedded ARM applications using assembler, C and C++. It includes a project manager, editor, build and debugger tools with support for RTOS-aware debugging on hardware or in a simulator.

- Designing SmartFusion cSoC with IAR Systems
- IAR Embedded Workbench IDE User Guide for ARM
- Download Evaluation or Kickstart version of IAR Embedded Workbench for ARM

Keil's Microcontroller Development Kit comes in two editions: MDK-ARM and MDK Basic. Both editions feature µVision®, the ARM Compiler, MicroLib, and RTX, but the MDK Basic edition is limited to 256K so that small applications are more affordable.

3.2.3. Operating Systems (Ask a Question)

FreeRTOS™ is a portable, open source, royalty free, mini real-time kernel (a free-to-download and free-to-deploy RTOS that can be used in commercial applications without any requirement to expose your proprietary source code). FreeRTOS is scalable and designed specifically for small embedded systems. This FreeRTOS version ported by Microchip is 6.0.1. For more information, visit the FreeRTOS website: www.freertos.org.

- SmartFusion Webserver Demo Using uIP and FreeRTOS
- SmartFusion cSoC: Running Webserver, TFTP on lwIP TCP/IP Stack application note

Emcraft Systems provides porting of the open-source U-boot firmware and uClinux™ kernel to the SmartFusion cSoC, a Linux®-based cross-development framework, and other complementary components. Combined with the release of its A2F-Linux Evaluation Kit, this provides a low-cost platform for evaluation and development of Linux (uClinux) on the Cortex-M3 CPU core of the Microchip SmartFusion cSoC.

- Emcraft Linux on Microchip's SmartFusion cSoC

Keil offers the RTX Real-Time Kernel as a royalty-free, deterministic RTOS designed for ARM and Cortex-M devices. It allows you to create programs that simultaneously perform multiple functions and helps to create applications which are better structured and more easily maintained.

- The RTX Real-Time Kernel is included with MDK-ARM. Download the Evaluation version of Keil MDK-ARM.
- RTX source code is available as part of Keil/ARM Real-Time Library (RL-ARM), a group of tightly-coupled libraries designed to solve the real-time and communication challenges of embedded systems based on ARM-powered microcontroller devices. The RL-ARM library now supports SmartFusion cSoCs and designers with additional key features listed in the Middleware.

Micrium supports SmartFusion cSoCs with the company's flagship µC/OS family, recognized for a variety of features and benefits, including unparalleled reliability, performance, dependability, impeccable source code and vast documentation. Micrium supports the following products for SmartFusion cSoCs and continues to work with Microchip on additional projects.

© 2026 Microchip Technology Inc. and its subsidiaries

- SmartFusion Quickstart Guide for Micrium µC/OS-III Examples
  - Design Files

µC/OS-III™, Micrium's newest RTOS, is designed to save time on your next embedded project and puts greater control of the software in your hands.

RoweBots provides an ultra tiny Linux-compatible RTOS called Unison for SmartFusion. Unison consists of a set of modular software components, which, like Linux, are either free or commercially licensed. Unison offers POSIX® and Linux compatibility with hard real-time performance, complete I/O modules and an easily understood environment for device driver programming. Seamless integration with FPGA and analog features are fast and easy.

- Unison V4-based products include a free Unison V4 Linux and POSIX-compatible kernel with serial I/O, file system, six demonstration programs, upgraded documentation and source code for Unison V4, and free (for non-commercial use) Unison V4 TCP/IP server. Commercial license upgrade is available for Unison V4 TCP/IP server with three demonstration programs, DHCP client and source code.
- Unison V5-based products include commercial Unison V5 Linux- and POSIX-compatible kernel with serial I/O, file system, extensive feature set, full documentation, source code and more than 20 demonstration programs, Unison V5 TCP/IPv4 with extended feature set, sockets interface, multiple network interfaces, PPP support, DHCP client, documentation, source code and six demonstration programs, and multiple other features.

3.3. Middleware (Ask a Question)

Microchip has ported both uIP and lwIP for Ethernet support as well as including TFTP file service.

- SmartFusion Webserver Demo Using uIP and FreeRTOS
- SmartFusion: Running Webserver, TFTP on lwIP TCP/IP Stack Application Note

The Keil/ARM Real-Time Library (RL-ARM)(1), in addition to RTX source, includes the following:

- RL-TCPnet (TCP/IP) – The Keil RL-TCPnet library, supporting full TCP/IP and UDP protocols, is a full networking suite specifically written for small ARM and Cortex-M processor-based microcontrollers. TCPnet is now ported to and supports SmartFusion Cortex-M3. It is highly optimized, has a small code footprint, and gives excellent performance, providing a wide range of application level protocols and examples such as FTP, SNMP, SOAP and AJAX. An HTTP server example of TCPnet working in a SmartFusion design is available.
- Flash File System (RL-Flash) allows your embedded applications to create, save, read, and modify files in standard storage devices such as ROM, RAM, or FlashROM, using a standard serial peripheral interface (SPI). Many ARM-based microcontrollers have a practical requirement for a standard file system. With RL-FlashFS you can implement new features in embedded applications such as data logging, storing program state during standby modes, or storing firmware upgrades.

Micrium, in addition to µC/OS-III®, offers the following support for SmartFusion cSoC:

- µC/TCP-IP™ is a compact, reliable, and high-performance stack built from the ground up by Micrium and has the quality, scalability, and reliability that translates into a rapid configuration of network options, remarkable ease-of-use, and rapid time-to-market.
- µC/Probe™ is one of the most useful tools in embedded systems design and puts you in the driver's seat, allowing you to take charge of virtually any variable, memory location, and I/O port in your embedded product, while your system is running.

© 2026 Microchip Technology Inc. and its subsidiaries

4. SmartFusion Programming (Ask a Question)

SmartFusion cSoCs have three separate flash areas that can be programmed:

1. The FPGA fabric
2. The embedded nonvolatile memories (eNVMs)
3. The embedded flash ROM (eFROM)

There are essentially three methodologies for programming these areas:

1. In-system programming (ISP)
2. In-application programming (IAP)
   - FPGA fabric, eNVM, and eFROM
3. Pre-programming (non-ISP)

Programming, whether ISP or IAP methodologies are employed, can be done in two ways:

1. Securely using the on chip AES decryption logic
2. In plain text

4.1. In-System Programming (Ask a Question)

In-System Programming is performed with the aid of external JTAG programming hardware. Table 4-1 describes the JTAG programming hardware that will program a SmartFusion cSoC and Table 4-2 defines the JTAG pins that provide the interface for the programming hardware.

Table 4-1. Supported JTAG Programming Hardware

Dongle	Source	JTAG	SWD[1]	SWV[2]	Program FPGA	Program eFROM	Program eNVM
FlashPro3/4	SoC Products Group	Yes	No	No	Yes	Yes	Yes
ULINK Pro	Keil	Yes	Yes	Yes	Yes[3]	Yes[3]	Yes
ULINK2	Keil	Yes	Yes	Yes	Yes[3]	Yes[3]	Yes
IAR J-Link	IAR	Yes	Yes	Yes	Yes[3]	Yes[3]	Yes

Notes:

1. SWD = ARM Serial Wire Debug
2. SWV = ARM Serial Wire Viewer
3. Planned support

Table 4-2. JTAG Pin Descriptions

Pin Name	Description
JTAGSEL	ARM Cortex®-M3 or FPGA test access port (TAP) controller selection
TRSTB	Test reset bar
TCK	Test clock
TMS	Test mode select
TDI	Test data input
TDO	Test data output

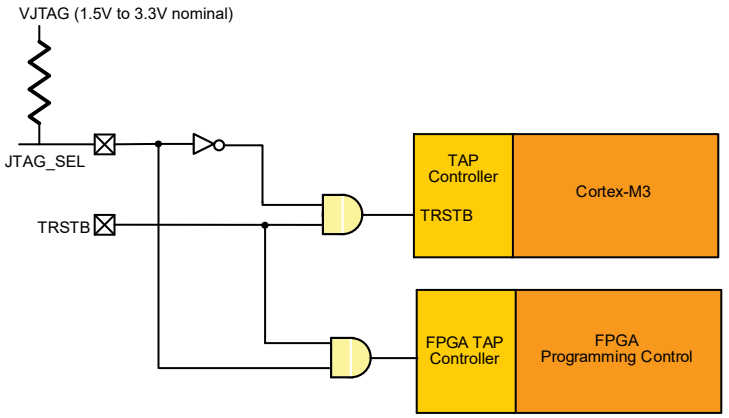
The JTAGSEL pin selects the FPGA TAP controller or the Cortex-M3 debug logic. When JTAGSEL is asserted, the FPGA TAP controller is selected and the TRSTB input into the Cortex-M3 is held in a reset state (logic 0), as depicted in the following figure. Users should tie the JTAGSEL pin high externally.

© 2026 Microchip Technology Inc. and its subsidiaries

Microchip's free Eclipse-based IDE, SoftConsole, has the ability to control the JTAGSEL pin directly with the FlashPro4 programmer. Manual jumpers are provided on the evaluation and development kits to allow manual selection of this function for the J-Link and ULINK debuggers.

Standard ARM JTAG connectors do not have access to the JTAGSEL pin. SoftConsole automatically selects the appropriate TAP controller using the CTXSELECT JTAG command. When using SoftConsole, the state of JTAGSEL is a "don't care."

Figure 4-1. TRSTB Logic



4.2. In-Application Programming (Ask a Question)

In-application programming refers to the ability to reprogram the various flash areas under direct supervision of the Cortex-M3.

4.2.1. Reprogramming the FPGA Fabric Using the Cortex-M3 (Ask a Question)

In this mode, the Cortex-M3 is executing the programming algorithm on-chip. The IAP driver can be incorporated into the design project and executed from eNVM or eSRAM. The SoC Products Group provides working example projects for SoftConsole, IAR, and Keil development environments. These can be downloaded via the SoC Products Group Firmware Catalog. The new bitstream to be programmed into the FPGA can reside on the user's printed circuit board (PCB) in a separate SPI flash memory. Alternately, the user can modify the existing projects supplied by the SoC Products Group and, via custom handshaking software, throttle the download of the new image and program the FPGA a piece at a time in real time. A cost-effective and reliable approach would be to store the bitstream in an external SPI flash. Another option is storing a redundant bitstream image in an external SPI flash and loading the newest version into the FPGA only when receiving an IAP command. Since the FPGA I/Os are tristated or held at predefined or last known state during FPGA programming, the user must use MSS I/Os to interface to external memories. Since there are two SPI controllers in the MSS, the user can dedicate one to an SPI flash and the other to the particulars of an application. The amount of flash memory required to program the FPGA always exceeds the size of the eNVM block that is on-chip. The external memory controller (EMC) cannot be used as an interface to a memory device for storage of a bitstream because its I/O pads are FPGA I/Os; hence they are tristated when the FPGA is in a programming state.

4.2.2. Re-Programming the eNVM Blocks Using the Cortex-M3 (Ask a Question)

In this mode the Cortex-M3 is executing the eNVM programming algorithm from eSRAM. Since individual pages (132 bytes) of the eNVM can be write-protected, the programming algorithm software can be protected from inadvertent erasure. When reprogramming the eNVM, both MSS I/Os and FPGA I/Os are available as interfaces for sourcing the new eNVM image. The SoC Products Group provides working example projects for SoftConsole, IAR, and Keil development environments. These can be downloaded via the SoC Products Group Firmware Catalog.

© 2026 Microchip Technology Inc. and its subsidiaries

Alternately, the eNVM can be reprogrammed by the Cortex-M3 via the IAP driver. This is necessary when using an encrypted image.

4.2.3. Secure Programming (Ask a Question)

For background, refer to the "Security in Low Power Flash Devices" chapter of the Fusion FPGA Fabric User's Guide on the SoC Products Group website. SmartFusion ISP behaves identically to Fusion ISP. IAP of SmartFusion cSoCs is accomplished by using the IAP driver. Only the FPGA fabric and the eNVM can be reprogrammed with the protection of security measures by using the IAP driver.

4.3. Typical Programming and Erase Times (Ask a Question)

Table 4-3 documents the typical programming and erase times for two components of SmartFusion cSoCs, FPGA fabric and eNVM, using the SoC Products Group's FlashPro hardware and software. These times will be different for other ISP and IAP methods. The Program action in FlashPro software includes erase, program, and verify to complete.

The typical programming (including erase) time per page of the eNVM is 8 ms.

Table 4-3. Typical Programming and Erase Times

	FPGA Fabric (seconds)	eNVM (seconds)
Device	**A2F500**	**A2F500**
Erase	21	N/A
Program	15	26
Verify	16	42

5. Pin Descriptions (Ask a Question)

5.1. Supply Pins (Ask a Question)

Name	Type	Description
GND	Ground	Digital ground to the FPGA fabric, microcontroller subsystem and GPIOs
GND15ADC0	Ground	Quiet analog ground to the 1.5V circuitry of the first analog-to-digital converter (ADC)
GND15ADC1	Ground	Quiet analog ground to the 1.5V circuitry of the second ADC
GND15ADC2	Ground	Quite analog ground to the 1.5V circuitry of the third ADC
GND33ADC0	Ground	Quiet analog ground to the 3.3V circuitry of the first ADC
GND33ADC1	Ground	Quiet analog ground to the 3.3V circuitry of the second ADC
GND33ADC2	Ground	Quiet analog ground to the 3.3V circuitry of the third ADC
GNDA	Ground	Quiet analog ground to the analog front-end
GNDAQ	Ground	Quiet analog ground to the analog I/O of SmartFusion cSoCs
GNDENVM	Ground	Digital ground to the embedded nonvolatile memory (eNVM)
GNDLPXTAL	Ground	Analog ground to the low power 32 KHz crystal oscillator circuitry
GNDMAINXTAL	Ground	Analog ground to the main crystal oscillator circuitry
GNDQ	Ground	Quiet digital ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ needs to always be connected on the board to GND.
GNDRCOSC	Ground	Analog ground to the integrated RC oscillator circuit
GNDSDD0	Ground	Analog ground to the first sigma-delta DAC
GNDSDD1	Ground	Common analog ground to the second and third sigma-delta DACs
GNDTM0	Ground	Analog temperature monitor common ground for signal conditioning blocks SCB 0 and SCB 1 (see information for pins TM0 and TM1 in the Analog Front-End (AFE) section).
GNDTM1	Ground	Analog temperature monitor common ground for signal conditioning block SCB 2 and SBCB 3 (see information for pins TM2 and TM3 in the Analog Front-End (AFE) section).
GNDTM2	Ground	Analog temperature monitor common ground for signal conditioning block SCB4
GNDVAREF	Ground	Analog ground reference used by the ADC. This pad should be connected to a quiet analog ground.
VCC	Supply	Digital supply to the FPGA fabric and MSS, nominally 1.5V. VCC is also required for powering the JTAG state machine, in addition to VJTAG. Even when a SmartFusion cSoC is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the SmartFusion cSoC.
VCC15A	Supply	Clean analog 1.5V supply to the analog circuitry. Always power this pin.
VCC15ADC0	Supply	Analog 1.5V supply to the first ADC. Always power this pin.
VCC15ADC1	Supply	Analog 1.5V supply to the second ADC. Always power this pin.
VCC15ADC2	Supply	Analog 1.5V supply to the third ADC. Always power this pin.
VCC33A	Supply	Clean 3.3V analog supply to the analog circuitry. VCC33A is also used to feed the 1.5V voltage regulator for designs that do not provide an external supply to VCC. Refer to the Voltage Regulator (VR), Power Supply Monitor (PSM), and Power Modes section in the SmartFusion Microcontroller Subsystem User's Guide for more information.
VCC33ADC0	Supply	Analog 3.3V supply to the first ADC. Never ground this pin. Can be left floating if unused.[1]
VCC33ADC1	Supply	Analog 3.3V supply to the second ADC. Never ground this pin. Can be left floating if unused.[1]
VCC33ADC2	Supply	Analog 3.3V supply to the third ADC. Never ground this pin. Can be left floating if unused.[1]
VCC33AP	Supply	Analog clean 3.3V supply to the charge pump. To avoid high current draw, VCC33AP should be powered up simultaneously with or after VCC33A. Can be pulled down if unused.[1]
VCC33N	Supply	–3.3V output from the voltage converter. A 2.2 µF capacitor must be connected from this pin to GND. Analog charge pump capacitors are not needed if none of the analog SCB features are used and none of the SDDs are used. In that case it should be left unconnected.

© 2026 Microchip Technology Inc. and its subsidiaries

Supply Pins (continued)		
Name	**Type**	**Description**
VCC33SDD0	Supply	Analog 3.3V supply to the first sigma-delta DAC
VCC33SDD1	Supply	Common analog 3.3V supply to the second and third sigma-delta DACs
VCCENVM	Supply	Digital 1.5V power supply to the embedded nonvolatile memory blocks. To avoid high current draw, VCC should be powered up before or simultaneously with VCCENVM.
VCCESRAM	Supply	Digital 1.5V power supply to the embedded SRAM blocks. Available only on the 208PQFP package. It should be connected to VCC (in other packages, it is internally connected to VCC).
VCCFPGAIOB0	Supply	Digital supply to the FPGA fabric I/O bank 0 (north FPGA I/O bank) for the output buffers and I/O logic. Each bank can have a separate VCCFPGAIO connection. All I/Os in a bank will run off the same VCCFPGAIO supply. VCCFPGAIO can be 1.5V, 1.8V, 2.5V, or 3.3V, nominal voltage. Unused I/O banks should have their corresponding VCCFPGAIO pins tied to GND.
VCCFPGAIOB1	Supply	Digital supply to the FPGA fabric I/O bank 1 (east FPGA I/O bank) for the output buffers and I/O logic. Each bank can have a separate VCCFPGAIO connection. All I/Os in a bank will run off the same VCCFPGAIO supply. VCCFPGAIO can be 1.5V, 1.8V, 2.5V, or 3.3V, nominal voltage. Unused I/O banks should have their corresponding VCCFPGAIO pins tied to GND.
VCCFPGAIOB5	Supply	Digital supply to the FPGA fabric I/O bank 5 (west FPGA I/O bank) for the output buffers and I/O logic. Each bank can have a separate VCCFPGAIO connection. All I/Os in a bank will run off the same VCCFPGAIO supply. VCCFPGAIO can be 1.5V, 1.8V, 2.5V, or 3.3V, nominal voltage. Unused I/O banks should have their corresponding VCCFPGAIO pins tied to GND.
VCCLPXTAL	Supply	Analog supply to the low power 32 KHz crystal oscillator. Always power this pin.[1]
VCCMAINXTAL	Supply	Analog supply to the main crystal oscillator circuit. Always power this pin.[1]
VCCMSSIOB2	Supply	Supply voltage to the microcontroller subsystem I/O bank 2 (east MSS I/O bank) for the output buffers and I/O logic. Each bank can have a separate VCCMSSIO connection. All I/Os in a bank will run off the same VCCMSSIO supply. VCCMSSIO can be 1.5V, 1.8V, 2.5V, or 3.3V, nominal voltage. Unused I/O banks should have their corresponding VCCMSSIO pins tied to GND.
VCCMSSIOB4	Supply	Supply voltage to the microcontroller subsystem I/O bank 4 (west MSS I/O bank) for the output buffers and I/O logic. Each bank can have a separate VCCMSSIO connection. All I/Os in a bank will run off the same VCCMSSIO supply. VCCMSSIO can be 1.5V, 1.8V, 2.5V, or 3.3V, nominal voltage. Unused I/O banks should have their corresponding VCCMSSIO pins tied to GND.
VCCPLLx	Supply	Analog 1.5V supply to the PLL. Always power this pin.
VCCRCOSC	Supply	Analog supply to the integrated RC oscillator circuit. Always power this pin.[1]
VCOMPLAx	Supply	Analog ground for the PLL
VDDBAT	Supply	External battery connection to the low power 32 KHz crystal oscillator (along with VCCLPXTAL), RTC, and battery switchover circuit. Can be pulled down if unused.
VJTAG	Supply	Digital supply to the JTAG controller SmartFusion cSoCs have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5V to 3.3V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned to be used, the VJTAG pin together with the TRSTB pin could be tied to GND. Note that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a SmartFusion cSoC is in a JTAG chain of interconnected boards and it is desired to power down the board containing the device, this can be done provided both VJTAG and VCC to the device remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode. See JTAG Pins.

© 2026 Microchip Technology Inc. and its subsidiaries

Supply Pins (continued)		
Name	**Type**	**Description**
VPP	Supply	Digital programming circuitry supply SmartFusion cSoCs support single-voltage in-system programming (ISP) of the configuration flash, embedded FlashROM (eFROM), and embedded nonvolatile memory (eNVM). For programming, VPP should be in the 3.3V ± 5% range. During normal device operation, VPP can be left floating or can be tied to any voltage between 0V and 3.6V. When the VPP pin is tied to ground, it shuts off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry. For proper programming, 0.01 µF and 0.33 µF capacitors (both rated at 16V) are to be connected in parallel across VPP and GND, and positioned as close to the FPGA pins as possible.

Notes:

1. The following 3.3V supplies should be connected together while following proper noise filtering practices: VCC33A, VCC33ADCx, VCC33AP, VCC33SDDx, VCCMAINXTAL, and VCCLPXTAL.
2. The following 1.5V supplies should be connected together while following proper noise filtering practices: VCC, VCC15A, and VCC15ADCx.

5.2. User-Defined Supply Pins (Ask a Question)

Name	Type	Polarity/Bus Size	Description
VAREF0	Input	1	Analog reference voltage for first ADC The SmartFusion cSoC can be configured to generate a 2.56V internal reference that can be used by the ADC. While using the internal reference, the reference voltage is output on the VAREFOUT pin for use as a system reference. If a different reference voltage is required, it can be supplied by an external source and applied to this pin. The valid range of values that can be supplied to the ADC is 1.0V to 3.3V. When VAREF0 is internally generated, a bypass capacitor must be connected from this pin to ground. The value of the bypass capacitor should be between 3.3 µF and 22 µF, which is based on the needs of the individual designs. The choice of the capacitor value has an impact on the settling time it takes the VAREF0 signal to reach the required specification of 2.56V to initiate valid conversions by the ADC. If the lower capacitor value is chosen, the settling time required for VAREF0 to achieve 2.56V will be shorter than when selecting the larger capacitor value. The above range of capacitor values supports the accuracy specification of the ADC, which is detailed in the datasheet. Designers choosing the smaller capacitor value will not obtain as much margin in the accuracy as that achieved with a larger capacitor value. See the Analog-to-Digital Converter (ADC) section in the SmartFusion Programmable Analog User's Guide for more information. The SoC Products Group recommends customers use 10 µF as the value of the bypass capacitor. Designers choosing to use an external VAREF0 need to ensure that a stable and clean VAREF0 source is supplied to the VAREF0 pin before initiating conversions by the ADC. To use the internal voltage reference, you must connect the VAREFOUT pin to the appropriate ADC VAREFx input—either the VAREF0 or VAREF1 pin—on the PCB.
VAREF1	Input	1	Analog reference voltage for second ADC See VAREF0 above for more information.
VAREF2	Input	1	Analog reference voltage for third ADC See VAREF0 above for more.
VAREFOUT	Out	1	Internal 2.56V voltage reference output. Can be used to provide the two ADCs with a unique voltage reference externally by connecting VAREFOUT to both VAREF0 and VAREF1. To use the internal voltage reference, you must connect the VAREFOUT pin to the appropriate ADC VAREFx input—either the VAREF0 or VAREF1 pin—on the PCB.

5.3. Global I/O Naming Conventions (Ask a Question)

Gmn (Gxxx) refers to Global I/Os. These Global I/Os are used to connect the input to global networks. Global networks have high fanout and low skew. The naming convention for Global I/Os is as follows:

- G = Global

© 2026 Microchip Technology Inc. and its subsidiaries

- m = Global pin location associated with each CCC on the device:
  - A (northwest corner)
  - B (northeast corner)
  - C (east middle)
  - D (southeast corner)
  - E (southwest corner)
  - F (west middle)
- n = Global input MUX and pin number of the associated Global location m—A0, A1, A2, B0, B1, B2, C0, C1, or C2.

Global (GL) I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities.

Unused GL pins are configured as inputs with pull-up resistors. See more detailed descriptions of global I/O connectivity in the clocking resources chapter of the SmartFusion FPGA Fabric User's Guide and the clock conditioning circuitry chapter of the SmartFusion Microcontroller Subsystem User's Guide.

All inputs labeled GC/GF are direct inputs into the quadrant clocks. The inputs to the global network are multiplexed, and only one input can be used as a global input. For example, if GAA0 is used as a quadrant global input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals.

5.4. User Pins (Ask a Question)

Name	Type	Polarity/Bus Size	Description
GPIO_x	In/out	32	Microcontroller Subsystem (MSS) General Purpose I/O (GPIO). The MSS GPIO pin functions as an input, output, tristate, or bidirectional buffer with configurable interrupt generation and Schmitt trigger support. Input and output signal levels are compatible with the I/O standard selected. Unused GPIO pins are tristated and do not include pull-up or pull-down resistors. During power-up, the used GPIO pins are tristated with no pull-up or pull-down resistors until Sys boot configures them. Some of these pins are also multiplexed with integrated peripherals in the MSS (SPI, I^2C, and UART). GPIOs can be routed to dedicated I/O buffers (MSSIOBUF) or in some cases to the FPGA fabric interface through an IOMUX. This allows GPIO pins to be multiplexed as either I/Os for the FPGA fabric, the ARM® Cortex-M3 or for given integrated MSS peripherals. The MSS peripherals are not multiplexed with each other; they are multiplexed only with the GPIO block. For more information, see the General Purpose I/O Block (GPIO) section in the SmartFusion Microcontroller Subsystem User's Guide.
IO	In/out		FPGA user I/O

5.4.1. User I/O Naming Conventions (Ask a Question)

The naming convention used for each FPGA user I/O is Gmn/IOuxwByVz, where:

Gmn is only used for I/Os that also have CCC access—that is, global pins. Refer to the Global I/O Naming Conventions.

u = I/O pair number in bank, starting at 00 from the northwest I/O bank and proceeding in a clockwise direction.

x = P (positive) or N (negative) or S (single-ended) or R (regular, single-ended).

© 2026 Microchip Technology Inc. and its subsidiaries

w = D (Differential Pair), P (Pair), or S (Single-Ended). D (Differential Pair) if both members of the pair are bonded out to adjacent pins or are separated only by one GND or NC pin; P (Pair) if both members of the pair are bonded out but do not meet the adjacency requirement; or S (Single-Ended) if the I/O pair is not bonded out. For Differential Pairs (D), adjacency for ball grid packages means only vertical or horizontal. Diagonal adjacency does not meet the requirements for a true differential pair.

B = Bank

y = Bank number starting at 0 from northwest I/O bank and incrementing clockwise.

V = Reference voltage

z = VREF mini bank number.

The FPGA user I/O pin functions as an input, output, tristate or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected. Unused I/O pins are disabled by Libero SoC software and include a weak pull-up resistor. During power-up, the used I/O pins are tristated with no pull-up or pull-down resistors until I/O enable (there is a delay after voltage stabilizes, and different I/O banks power up sequentially to avoid a surge of ICCI).

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

Some of these pins are also multiplexed with integrated peripherals in the MSS (Ethernet MAC and external memory controller).

All unused MSS I/Os are tristated by default (with output buffer disabled). However, you can configure it as weak pull-up or pull-down by using Libero SoC I/O attributor window. The Schmitt trigger is disabled. Essentially, I/Os have the reset values as defined in Table 19-25 IOMUX_n_CR, in the SmartFusion Microcontroller Subsystem User's Guide.

During programming, I/Os become tristated and weakly pulled up to VCCI. With the VCCI and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration. For more information, see the SmartFusion FPGA User I/Os section in the SmartFusion FPGA Fabric User's Guide.

5.5. Special Function Pins (Ask a Question)

Name	Type	Polarity/Bus Size	Description
NC	—	—	No connect This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.
DC	—	—	Do not connect. This pin should not be connected to any signals on the PCB. These pins should be left unconnected.
LPXIN	In	1	Low power 32 KHz crystal oscillator. Input from the 32 KHz oscillator. Pin for connecting a low power 32 KHz watch crystal. If not used, the LPXIN pin can be left floating. For more information, see the PLLs, Clock Conditioning Circuitry, and On-Chip Crystal Oscillators section in the SmartFusion Microcontroller Subsystem User's Guide.

© 2026 Microchip Technology Inc. and its subsidiaries

Special Function Pins (continued)			
Name	**Type**	**Polarity/Bus Size**	**Description**
LPXOUT	In	1	Low power 32 KHz crystal oscillator. Output to the 32 KHz oscillator. Pin for connecting a low power 32 KHz watch crystal. If not used, the LPXOUT pin can be left floating. For more information, see the PLLs, Clock Conditioning Circuitry, and On-Chip Crystal Oscillators section in the SmartFusion Microcontroller Subsystem User's Guide.
MAINXIN	In	1	Main crystal oscillator circuit. Input to the crystal oscillator circuit. Pin for connecting an external crystal, ceramic resonator, or RC network. When using an external crystal or ceramic oscillator, external capacitors are also recommended. Refer to documentation from the crystal oscillator manufacturer for proper capacitor value. If using an external RC network or clock input, MAINXIN should be grounded for better noise immunity. For more information, see the PLLs, Clock Conditioning Circuitry, and On-Chip Crystal Oscillators section in the SmartFusion Microcontroller Subsystem User's Guide.
MAINXOUT	Out	1	Main crystal oscillator circuit. Output from the crystal oscillator circuit. Pin for connecting external crystal or ceramic resonator. When using an external crystal or ceramic oscillator, external capacitors are also recommended. Refer to documentation from the crystal oscillator manufacturer for proper capacitor value. If using external RC network or clock input, MAINXIN should be grounded and MAINXOUT left unconnected. For more information, see the PLLs, Clock Conditioning Circuitry, and On-Chip Crystal Oscillators section in the SmartFusion Microcontroller Subsystem User's Guide.
NCAP	—	1	Negative capacitor connection. This is the negative terminal of the charge pump. A capacitor, with a 2.2 µF recommended value, is required to connect between PCAP and NCAP. Analog charge pump capacitors are not needed if none of the analog SCB features are used and none of the SDDs are used. In that case it should be left unconnected.
PCAP	—	1	Positive Capacitor connection. This is the positive terminal of the charge pump. A capacitor, with a 2.2 µF recommended value, is required to connect between PCAP and NCAP. If this pin is not used, it must be left unconnected/floating. In this case, no capacitor is needed. Analog charge pump capacitors are not needed if none of the analog SCB features are used, and none of the SDDs are used.
PTBASE	—	1	Pass transistor base connection This is the control signal of the voltage regulator. This pin should be connected to the base of an external pass transistor used with the 1.5V internal voltage regulator and can be floating if not used.
PTEM	—	1	Pass transistor emitter connection. This is the feedback input of the voltage regulator. This pin should be connected to the emitter of an external pass transistor used with the 1.5V internal voltage regulator and can be floating if not used.
MSS_RESET_N	—	Low	Low Reset signal which can be used as an external reset and can also be used as a system level reset under control of the Cortex-M3 processor. MSS_RESET_N is an output asserted low after power-on reset. The direction of MSS_RESET_N changes during the execution of the Microchip System Boot when chip-level reset is enabled. The Microchip System Boot reconfigures MSS_RESET_N to become a reset input signal when chip-level reset is enabled. It has an internal pull-up so it can be left floating. In the current software, the MSS_RESET_N is modeled as an external input signal only.
PU_N	In	Low	Push-button is the connection for the external momentary switch used to turn on the 1.5V voltage regulator and can be floating if not used.

5.6. JTAG Pins (Ask a Question)

SmartFusion cSoCs have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5V to 3.3V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the SmartFusion cSoC part must be supplied to allow JTAG signals to transition the SmartFusion cSoC. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility with supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned to be used, the VJTAG pin together with the TRSTB pin could be tied to GND.

Name	Type	Polarity/Bus Size	Description
JTAGSEL	In	1	JTAG controller selection Depending on the state of the JTAGSEL pin, an external JTAG controller will either see the FPGA fabric TAP/auxiliary TAP (High) or the Cortex-M3 JTAG debug interface (Low). The JTAGSEL pin should be connected to an external pull-up resistor such that the default configuration selects the FPGA fabric TAP.
TCK	In	1	Test clock Serial input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/-down resistor. If JTAG is not used, it is recommended to tie off TCK to GND or V_{JTAG} through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state. Note that to operate at all V_{JTAG} voltages, 500Ω to 1 kΩ will satisfy the requirements. Refer to Table 5-1 for more information. Can be left floating when unused.
TDI	In	1	Test data Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.
TDO	Out	1	Test data Serial output for JTAG boundary scan, ISP, and UJTAG usage.
TMS	In	HIGH	Test mode select The TMS pin controls the use of the IEEE1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin. Can be left floating when unused.
TRSTB	In	HIGH	Boundary scan reset pin The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the TAP is held in reset mode. The resistor values must be chosen from Table 5-1 and must satisfy the parallel resistance value requirement. The values in Table 5-1 correspond to the resistor recommended when a single device is used. The values correspond to the equivalent parallel resistor when multiple devices are connected via a JTAG chain. In critical applications, an upset in the JTAG circuit could allow entering an undesired JTAG state. In such cases, it is recommended that you tie off TRST to GND through a resistor placed close to the FPGA pin. The TRSTB pin also resets the serial wire JTAG – debug port (SWJ-DP) circuitry within the Cortex-M3. Can be left floating when unused.

Table 5-1. Recommended Tie-Off Values for the TCK and TRST Pins

VJTAG	Tie-Off Resistance[1, 2, 3]
VJTAG at 3.3V	200Ω to 1 kΩ
VJTAG at 2.5V	200Ω to 1 kΩ
VJTAG at 1.8V	500Ω to 1 kΩ
VJTAG at 1.5V	500Ω to 1 kΩ

© 2026 Microchip Technology Inc. and its subsidiaries

Notes:

1. The TCK pin can be pulled up/down.
2. The TRST pin can only be pulled down.
3. Equivalent parallel resistance if more than one device is on JTAG chain.

5.7. Microcontroller Subsystem (MSS) (Ask a Question)

Name	Type	Polarity/ Bus Size	Description
External Memory Controller			
EMC_ABx	Out	26	External memory controller address bus Can also be used as an FPGA user I/O (see IO).
EMC_BYTENx	Out	LOW/2	External memory controller byte enable Can also be used as an FPGA user I/O (see IO).
EMC_CLK	Out	Rise	External memory controller clock Can also be used as an FPGA user I/O (see IO).
EMC_CSx_N	Out	LOW/2	External memory controller chip selects Can also be used as an FPGA User IO (see IO).
EMC_DBx	In/out	16	External memory controller data bus Can also be used as an FPGA user I/O (see IO).
EMC_OENx_N	Out	LOW/2	External memory controller output enables Can also be used as an FPGA User IO (see IO).
EMC_RW_N	Out	Level	External memory controller read/write. Read = High, write = Low. Can also be used as an FPGA user I/O (see IO).
Inter-Integrated Circuit (I^2C) Peripherals			
I2C_0_SCL	In/out	1	I^2C bus serial clock output. First I^2C. Can also be used as an MSS GPIO (see GPIO).
I2C_0_SDA	In/out	1	I^2C bus serial data input/output. First I^2C. Can also be used as an MSS GPIO (see GPIO).
I2C_1_SCL	In/out	1	I^2C bus serial clock output. Second I^2C. Can also be used as an MSS GPIO (see GPIO).
I2C_1_SDA	In/out	1	I^2C bus serial data input/output. Second I^2C. Can also be used as an MSS GPIO (see GPIO).
Serial Peripheral Interface (SPI) Controllers			
SPI_0_CLK	Out	1	Clock. First SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_0_DI	In	1	Data input. First SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_0_DO	Out	1	Data output. First SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_0_SS	Out	1	Slave select (chip select). First SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_1_CLK	Out	1	Clock. Second SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_1_DI	In	1	Data input. Second SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_1_DO	Out	1	Data output. Second SPI. Can also be used as an MSS GPIO (see GPIO).
SPI_1_SS	Out	1	Slave select (chip select). Second SPI. Can also be used as an MSS GPIO (see GPIO).
Universal Asynchronous Receiver/Transmitter (UART) Peripherals			

© 2026 Microchip Technology Inc. and its subsidiaries

Microcontroller Subsystem (MSS) (continued)			
Name	**Type**	**Polarity/ Bus Size**	**Description**
UART_0_RXD	In	1	Receive data. First UART. Can also be used as an MSS GPIO (see GPIO).
UART_0_TXD	Out	1	Transmit data. First UART. Can also be used as an MSS GPIO (see GPIO).
UART_1_RXD	In	1	Receive data. Second UART. Can also be used as an MSS GPIO (see GPIO).
UART_1_TXD	Out	1	Transmit data. Second UART. Can also be used as an MSS GPIO (see GPIO).
Ethernet MAC			
MAC_CLK	In	Rise	Receive clock. 50 MHz ± 50 ppm clock source received from RMII PHY. Can be left floating when unused.
MAC_CRSDV	In	High	Carrier sense/receive data valid for RMII PHY Can also be used as an FPGA User IO (see IO).
MAC_MDC	Out	Rise	RMII management clock Can also be used as an FPGA User IO (see IO).
MAC_MDIO	In/Out	1	RMII management data input/output Can also be used as an FPGA User IO (see IO).
MAC_RXDx	In	2	Ethernet MAC receive data. Data recovered and decoded by PHY. The RXD[0] signal is the least significant bit. Can also be used as an FPGA User I/O (see IO).
MAC_RXER	In	HIGH	Ethernet MAC receive error. If MACRX_ER is asserted during reception, the frame is received and status of the frame is updated with MACRX_ER. Can also be used as an FPGA user I/O (see IO).
MAC_TXDx	Out	2	Ethernet MAC transmit data. The TXD[0] signal is the least significant bit. Can also be used as an FPGA user I/O (see IO).
MAC_TXEN	Out	HIGH	Ethernet MAC transmit enable. When asserted, indicates valid data for the PHY on the TXD port. Can also be used as an FPGA User I/O (see IO).

5.8. Analog Front-End (AFE) (Ask a Question)

Name	Type	Description	Associated With	
			ADC/SDD	SCB
ABPS0	In	SCB 0 / active bipolar prescaler input 1. See the Active Bipolar Prescaler (ABPS) section in the SmartFusion Programmable Analog User's Guide.	ADC0	SCB0
ABPS1	In	SCB 0 / active bipolar prescaler Input 2	ADC0	SCB0
ABPS2	In	SCB 1 / active bipolar prescaler Input 1	ADC0	SCB1
ABPS3	In	SCB 1 / active bipolar prescaler Input 2	ADC0	SCB1
ABPS4	In	SCB 2 / active bipolar prescaler Input 1	ADC1	SCB2
ABPS5	In	SCB 2 / active bipolar prescaler Input 2	ADC1	SCB2
ABPS6	In	SCB 3 / active bipolar prescaler Input 1	ADC1	SCB3
ABPS7	In	SCB 3 / active bipolar prescaler input 2	ADC1	SCB3
ABPS8	In	SCB 4 / active bipolar prescaler input 1	ADC2	SCB4
ABPS9	In	SCB 4 / active bipolar prescaler input 2	ADC2	SCB4
ADC0	In	ADC 0 direct input 0 / FPGA Input. See the "Sigma-Delta Digital-to-Analog Converter (DAC)" section in the SmartFusion Programmable Analog User's Guide.	ADC0	SCB0
ADC1	In	ADC 0 direct input 1 / FPGA input	ADC0	SCB0

© 2026 Microchip Technology Inc. and its subsidiaries

Analog Front-End (AFE) (continued)				
Name	Type	Description	Associated With	
			ADC/SDD	SCB
ADC2	In	ADC 0 direct input 2 / FPGA input	ADC0	SCB1
ADC3	In	ADC 0 direct input 3 / FPGA input	ADC0	SCB1
ADC4	In	ADC 1 direct input 0 / FPGA input	ADC1	SCB2
ADC5	In	ADC 1 direct input 1 / FPGA input	ADC1	SCB2
ADC6	In	ADC 1 direct input 2 / FPGA input	ADC1	SCB3
ADC7	In	ADC 1 direct input 3 / FPGA input	ADC1	SCB3
ADC8	In	ADC 2 direct input 0 / FPGA input	ADC2	SCB4
ADC9	In	ADC 2 direct input 1 / FPGA input	ADC2	SCB4
ADC10	In	ADC 2 direct input 2 / FPGA input	ADC2	N/A
ADC11	In	ADC 2 direct input 3 / FPGA input	ADC2	N/A
CM0	In	SCB 0 / high side of current monitor / comparator Positive input. See the Current Monitor section in the SmartFusion Programmable Analog User's Guide.	ADC0	SCB0
CM1	In	SCB 1 / high side of current monitor / comparator. Positive input.	ADC0	SCB1
CM2	In	SCB 2 / high side of current monitor / comparator. Positive input.	ADC1	SCB2
CM3	In	SCB 3 / high side of current monitor / comparator. Positive input.	ADC1	SCB3
CM4	In	SCB 4 / high side of current monitor / comparator. Positive input.	ADC2	SCB4
TM0	In	SCB 0 / low side of current monitor / comparator Negative input / high side of temperature monitor. See the Temperature Monitor section.	ADC0	SCB0
TM1	In	SCB 1 / low side of current monitor / comparator. Negative input / high side of temperature monitor.	ADC0	SCB1
TM2	In	SCB 2 / low side of current monitor / comparator. Negative input / high side of temperature monitor.	ADC1	SCB2
TM3	In	SCB 3 low side of current monitor / comparator. Negative input / high side of temperature monitor.	ADC1	SCB3
TM4	In	SCB 4 low side of current monitor / comparator. Negative input / high side of temperature monitor.	ADC2	SCB4
SDD0	Out	Output of SDD0 See the Sigma-Delta Digital-to-Analog Converter (DAC) section in the SmartFusion Programmable Analog User's Guide.	SDD0	N/A
SDD1	Out	Output of SDD1	SDD1	N/A
SDD2	Out	Output of SDD2	SDD2	N/A

Note: Unused analog inputs should be grounded. This aids in shielding and prevents an undesired coupling path.

5.9. Analog Front-End Pin-Level Function Multiplexing (Ask a Question)

Table 5-2 describes the relationships between the various internal signals found in the analog front-end (AFE) and how they are multiplexed onto the external package pins. Note that, in general, only one function is available for those pads that have numerous functions listed. The exclusion to this rule is when a comparator is used; the ADC can still convert either input side of the comparator.

Table 5-2. Relationships Between Signals in the Analog Front-End

Pin	ADC Channel	Dir.-In Option	Prescaler	Current Mon.	Temp. Mon.	Compar.	LVTTL	SDD MUX	SDD
ABPS0	ADC0_CH1	—	ABPS0_IN	—	—	—	—	—	—
ABPS1	ADC0_CH2	—	ABPS1_IN	—	—	—	—	—	—

Notes:

1. Device A2F060 is discontinued.
2. Denotes pins that do not have completely identical functions from density to density. For example, the bank assignment can be different for an I/O, or the function might be available only on a larger density device.

6. Revision History (Ask a Question)

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

Revision	Date	Description
A	11/2023	The following is the list of changes made in the revision A of the document: • The document was converted to Microchip template • The document number was changed to DS50003607A from 51700120 • Device status of A2F060 has been changed to “Discontinued” in Table 3. • Added a note “Device A2F060 is discontinued” in the following tables: – Table 1 – Table 4 – Table 2-6 – Table 2-8 – Table 2-14 – Table 2-15 – Table 2-81 – Table 2-90 – Table 2-101 – Table 5-3 • Updated the Microchip link for “SmartFusion Programmable Analog User’s Guide”, “FlashPro User’s Guide”, “ProASIC3 FPGA Fabric User’s Guide”, and the location of IBIS model
2	—	Updated information about unused MSS I/O configuration in "User I/O Naming Conventions" (SAR 62994).
1	—	The status was changed from Preliminary to Production for A2F060 and A2F500 in the "SmartFusion cSoC Device Status" table (SAR 41135).

Microchip FPGA Support

Microchip FPGA products group backs its products with various support services, including Customer Service, Customer Technical Support Center, a website, and worldwide sales offices. Customers are suggested to visit Microchip online resources prior to contacting support as it is very likely that their queries have been already answered.

Contact Technical Support Center through the website at www.microchip.com/support. Mention the FPGA Device Part number, select appropriate case category, and upload design files while creating a technical support case.

Contact Customer Service for non-technical product support, such as product pricing, product upgrades, update information, order status, and authorization.

- From North America, call **800.262.1060**
- From the rest of the world, call **650.318.4460**
- Fax, from anywhere in the world, **650.318.8044**

Microchip Information

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

© 2026 Microchip Technology Inc. and its subsidiaries

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

Legal Notice

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at www.microchip.com/en-us/support/design-help/client-support-services.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet- Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, TrueTime, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, Clockstudio, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCcompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic
