GENERAL DESCRIPTION

The AD9988 is a highly integrated device with four 16-bit, 12 GSPS maximum sample rate, RF digital-to-analog converter (DAC) cores, and four 12-bit, 4 GSPS rate, RF analog-to-digital converter (ADC) cores. The device supports four transmitter channels and four receiver channels with a 4T4R configuration. This product is well suited for four-antenna TDD transmitter applications, where the receiver path can be shared between receiver and observation modes. The GPIO pins can be configured and toggled to support different user modes, while phase coherency is maintained. The maximum radio channel bandwidth supported is 1.2 GHz in a 4T4R configuration and a sample resolution of 16 bits. The AD9988 features a 16-lane 24.75 Gbps JESD204C or 15.5 Gbps JESD204B serial data port that allows up to eight lanes per transmit/receive link, an on-chip clock multiplier, and digital signal processing capability targeted at multiband direct to RF radio applications.

RECOMMENDED OPERATING CONDITIONS

Successful DAC calibration is required during the device initialization phase that occurs shortly after power-up to ensure long-term reliability of the DAC core circuitry. Refer to UG-1578, the device user guide, for more information on device initialization.

DAC datapath with a complex I/Q data rate frequency (f_{IQ_DATA}) = 1500 MSPS, interpolation of 8×, and DAC frequency (f_{DAC}) of 12 GSPS. JRx mode of 15C (L = 8, M = 8, F = 2, S = 1, K = 128, E = 1, N = 16, NP = 16).

ADC datapath with a complex f_{IQ_DATA} =1500 MSPS, decimation of 2×, and f_{ADC} of 3 GSPS. JTx mode of 16C (L = 8, M = 8, F = 2, S = 1, K = 128, E = 1, N = 16, NP = 16).

Note that the AD9988 does not support the option to bypass the CDUC in the transmit data path and the CDDC in the receive data path.

See the UG-1578 user guide for further information on the JESD204B and JESD204C mode configurations, and a detailed description of the settings referenced throughout this data sheet. 	Single DAC, FDUC bypassed, 1 CDUC enabled (not bypassable), 12-bit or 16-bit resolution; limited by the maximum DAC clock rate and the minimum total interpolation of 2× inside the CDUC block			6000	MSPS
	Quad DAC, FDUC bypassed, 4 CDUCs enabled (not bypassable), 12-bit resolution; limited by the maximum JESD204C link throughput (M = 8, L = 8) and the minimum total interpolation of 2× inside the CDUC block			2000	MSPS

	2 channels: FDUC bypassed, 2 CDUCs enabled, 12-bit resolution; limited by the maximum JESD204C link throughput (M = 4, L = 8)			4000	MSPS
	4 channels: FDUC bypassed, 4 CDUCs enabled, 12-bit resolution; limited by the maximum JESD204C link throughput (M = 8, L = 8)			2000	MSPS
	8 channels: 8 FDUCs enabled, one or more CDUC enabled, 12-bit or 16-bit resolution; limited by the maximum FDUC NCO clock rate divided by the minimum 2x interpolation rate required to enable the FDUC			750	MSPS

[1] The values listed for these parameters are the maximum possible when considering all JESD204 modes of operation. Some modes are more limiting, based on other parameters.

[2] The interpolation filters in the Tx datapath have a total complex filter bandwidth of 80% of the data rate, combining the 40% bandwidth in the I path and 40% bandwidth in the Q path. Similarly, the decimation stages inside the Rx datapath use filters with a total complex filter bandwidth of 81.4%. Therefore, the maximum allowed instantaneous complex signal bandwidth (iBW) per channel is calculated as iBW = [Complex I/Q Data Rate per Channel] × [Total Complex Filter Bandwidth].

[1] The 0.8 factor is because the total complex pass-band of the first interpolation filter is 80% of the filter input data rate.

[2] The 0.814 factor is because the total complex pass-band of the decimation filter is 81.4% of the filter output data rate.

ANALOG BANDWIDTH[4]		7.5			7.5		GHz

[1] Noise density is measured at 250 MHz input frequency at −30 dBFS, where timing jitter does not degrade noise floor.

[2] Noise figure is based on a nominal full-scale input power of 4.5 dBm with an input span of 1.4 V p-p and R_{IN} = 100 Ω.

[3] With background interleaving calibration converged.

[4] Analog input bandwidth is the bandwidth of operation in which the full-scale input frequency response rolls off by −3 dB based on a de-embedded model of the ADC extracted from the measured frequency response on evaluation board. This bandwidth requires optimized matching network to achieve this upper bandwidth.

TIMING SPECIFICATIONS

For the minimum and maximum values, T_J = −40°C to +120°C and ±5% of nominal supply, unless otherwise noted.

[1] Tested continuously for 1000 hours with f_{IN} = 4.7 GHz pulsed and continuous tone at maximum allowed junction temperature (T_J). Refer to UG-1578, the device user guide, for more information.

[2] Do not exceed this temperature for any duration of time when the device is powered.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to PCB design and operating environment. The use of appropriate thermal management techniques is recommended to ensure that the maximum T_J does not exceed the limits shown in Table 19.

θ_{JA} is the natural convection, junction to ambient thermal resistance measured in a one cubic foot sealed enclosure.

θ_{JC_TOP} is the junction to case, thermal resistance.

θ_{JB} is the junction to board, thermal resistance.

Table 20. Simulated Thermal Resistance[1]

PCB Type	Airflow Velocity (m/sec)	θ_{JA}	θ_{JC_TOP}	θ_{JB}	Unit
JEDEC 2s2p Board	0.0	14.9	0.70	1.8	°C/W

[1] Thermal resistance values specified are simulated based on JEDEC specifications in compliance with JESD51-12 with the device power equal to 9 W.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The AD9988 is a highly integrated, mixed-signal, direct radio frequency (RF) sampling transceiver offering four transmitters and four receivers (4T4R) and digital signal processing (DSP) functions (see Figure 1). The device delivers a versatile combination of high performance, configurability, and low power consumption demanded by wireless infrastructure applications such as multiband macro 5G and mmWave 5G base station radios. The AD9988 also offers features to support the time division duplex (TDD) and the frequency division duplex (FDD) techniques.

The receive path consists of four pipelined, 12-bit, 4 GSPS rate, RF analog-to-digital converter (ADC) cores. The transmit path consists of four 16-bit, 12 GSPS maximum sample rate, RF digital-to-analog converter (DAC) cores. Both receive and transmit paths are designed and optimized to sample and synthesize signals up to 7.5 GHz, with maximum instantaneous bandwidths of up to 1.2 GHz with a sample resolution of 16 bits. The device also supports lower resolutions such as 12 bits and 8 bits to reduce the bit rate of the JESD204B/C link for applications that do not require the higher dynamic range a 16-bit resolution offers. The wide instantaneous bandwidth allows the chip to support multiple carrier bands or a single wide band within a single device. The combination of the direct RF conversion architecture relaxes the requirements of the RF filters when compared to traditional intermediate frequency (IF) receivers. Several auxiliary functions, such fast detect and signal monitor, a programmable finite impulse response (FIR) filter, transmit downstream power amplifier protection, and general-purpose inputs/output (GPIO) control are also integrated.

The DAC and ADC cores use sampling clocks that originate from either an external clock source or an on-chip clock multiplier that consists of an integer PLL circuit and voltage-controlled oscillator (VCO).

The device features eight transmit and eight receive lanes, where each lane supports up to 24.75 Gbps JESD204C or up to 15.5 Gbps JESD204B as a single or a dual link. Multichip synchronization and deterministic latency are supported according to JESD204B/C Subclass 1. The JESD204B/C interface supports a wide range of setups depending on the interface bandwidth requirements of the custom application specific IC (ASIC) or field-programmable gate array (FPGA). Refer to UG-1578, the device user guide, for more information on device features and operation.

The AD9988 has an on-chip thermal management unit (TMU) that can be used to measure die junction temperature as part of a thermal management solution to guarantee thermal stability during system operation. The device is controlled via a standard 4-wire serial port interface (SPI) with support for 3-wire SPI communications. A comprehensive set of power-down modes are included to minimize power consumption during system downtime. The AD9988 is packaged in a 15 mm × 15 mm, 324-ball, thermally enhanced, ball grid array (BGA_ED).
