

**THE DATASHEET OF  
LD2980ABM50TR**

## Ultra low drop voltage regulators compatible with low ESR output capacitors

Datasheet - production data

### Description

The low drop voltage and the ultra low quiescent current make them suitable for low noise, low power applications and in battery powered systems. The quiescent current in sleep mode is less than 1  $\mu\text{A}$  when the INHIBIT pin is pulled low. A shutdown logic control function is available on pin n° 3 (TTL compatible). This means that when the device is used as local regulator, it is possible to put a part of the board in standby, decreasing the total power consumption. The LD2980 is designed to work with low ESR ceramic capacitors. Typical applications are cellular phone, laptop computer, personal digital assistant (PDA), personal stereo, camcorder and camera.

### Features

- Stable with low ESR ceramic capacitors
- Ultra low dropout voltage (0.12 V typ. at 50 mA load, 7 mV typ. at 1 mA load)
- Very low quiescent current (80  $\mu\text{A}$  typ. at no load in on mode; max 1  $\mu\text{A}$  in off mode)
- Guaranteed output current up to 50 mA
- Logic-controlled electronic shutdown
- Output voltage of 1.8; 3.0; 3.3; 5.0 V
- Internal current and thermal limit
- $\pm 0.5\%$  Tolerance output voltage available (A version)
- Output low noise voltage 160  $\mu\text{VRMS}$
- Temperature range: -40 to 125  $^{\circ}\text{C}$
- Smallest package SOT23-5L
- Fast dynamic response to line and load changes

**Table 1. Device summary**

## 2 Pin configuration

Figure 2. Pin connections (top view)

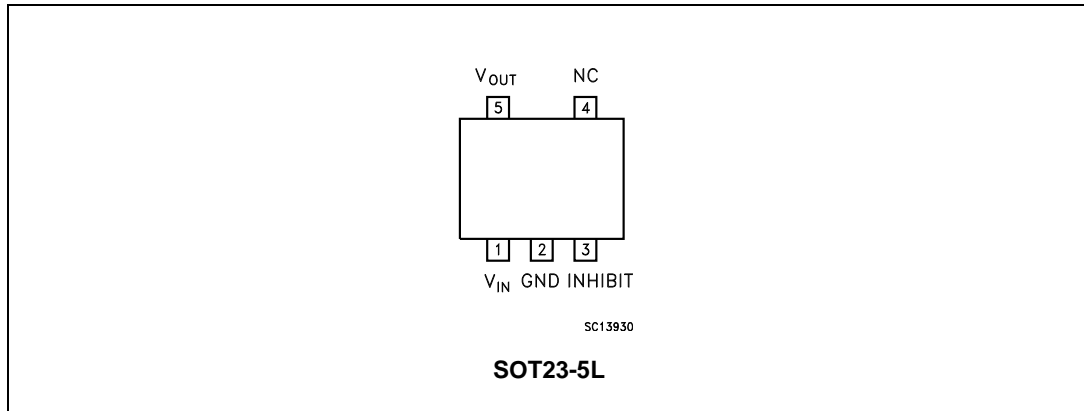

Table 2. Pin description

Pin n°	Symbol	Name and function
1	$V_{IN}$	Input port
2	GND	Ground pin
3	INHIBIT	Control switch ON/OFF. Inhibit is not internally pulled-up; it cannot be left floating. Disable the device when connected to GND or to a positive voltage less than 0.18 V
4	NC	Not connected
5	$V_{OUT}$	Output port

Table 3. Thermal data

Symbol	Parameter	Value	Unit
$R_{thJC}$	Thermal resistance junction-case	81	°C/W
$R_{thJA}$	Thermal resistance junction-ambient	255	°C/W

### 3 Maximum ratings

**Table 4. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_I$	DC input voltage	-0.3 to 16	V
$V_{INH}$	INHIBIT input voltage	-0.3 to 16	V
$I_O$	Output current	Internally limited	
$P_D$	Power dissipation	Internally limited	
$T_{STG}$	Storage temperature range	-55 to 150	°C
$T_{OP}$	Operating junction temperature range	-40 to 125	°C

*Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.*

## 4 Typical application

Figure 3. Application circuit

**Note:** *Inhibit pin is not internally pulled-up then it must not be left floating. Disable the device when connected to GND or to a positive voltage less than 0.18 V.*

## 5 Electrical characteristics

( $T_J = 25\text{ °C}$ ,  $V_I = V_{O(NOM)} + 1\text{ V}$ ,  $C_I = 1\text{ }\mu\text{F}$ ,  $C_O = 2.2\text{ }\mu\text{F}$ ,  $I_O = 1\text{ mA}$ ,  $V_{INH} = 2\text{ V}$ , unless otherwise specified).

## 7 Application notes

### 7.1 External capacitors

Like any low-dropout regulator, the LD2980 requires external capacitors for regulator stability. This capacitor must be selected to meet the requirements of minimum capacitance and equivalent series resistance (please refer to [Figure 18](#) and [Figure 19](#)). We suggest to solder input and output capacitors as close as possible to the relative pins.

### 7.2 Input capacitor

An input capacitor whose value is 1  $\mu\text{F}$  is required with the LD2980 (amount of capacitance can be increased without limit). This capacitor must be located a distance of not more than 0.5" from the input pin of the device and returned to a clean analog ground. Any good quality ceramic, tantalum or film capacitors can be used for this capacitor.

### 7.3 Output capacitor

The LD2980 is designed specifically to work with ceramic output capacitors. It may also be possible to use Tantalum capacitors, but these are not as attractive for reasons of size and cost. By the way, the output capacitor must meet both the requirement of minimum amount of capacitance and ESR (equivalent series resistance) value. The [Figure 18](#) and [Figure 19](#) show the allowable ESR range as a function of the output capacitance. These curves represent the stability region over the full temperature and  $I_O$  range. Due to the different loop gain, the stability improves for higher output versions and so the suggested minimum output capacitor value, if low ESR ceramic type is used, is 1  $\mu\text{F}$  for output voltages equal or major than 3.8 V, 2.2  $\mu\text{F}$  for output voltages from 2.85 to 3.3 V, and 3.3  $\mu\text{F}$  for the other versions. However, if an output capacitor lower than the suggested one is used, it's possible to make stable the regulator adding a resistor in series to the capacitor (see [Figure 18](#) and [Figure 19](#) to choose the right value according to the used version and keeping in account that the ESR of ceramic capacitors has been measured @ 100 kHz).

### 7.4 Important

The output capacitor must maintain its ESR in the stable region over the full operating temperature to assure stability. Also, capacitor tolerance and variation with temperature must be considered to assure the minimum amount of capacitance is provided at all times. This capacitor should be located not more than 0.5" from the output pin of the device and returned to a clean analog ground.

### 7.5 Inhibit input operation

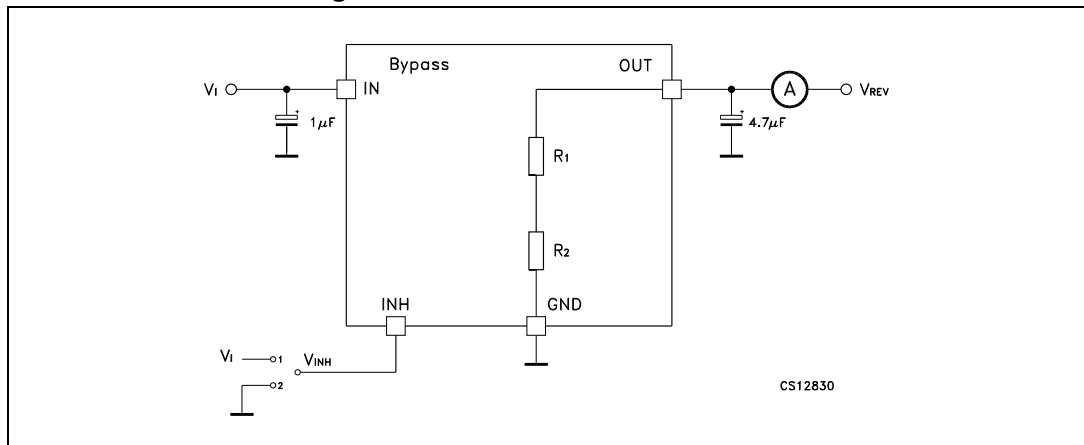

The inhibit pin can be used to turn OFF the regulator when pulled low, so drastically reducing the current consumption down to less than 1  $\mu\text{A}$ . When the inhibit feature is not used, this pin must be tied to  $V_I$  to keep the regulator output ON at all times. To assure proper operation, the signal source used to drive the inhibit pin must be able to swing above

and below the specified thresholds listed in the electrical characteristics section under  $V_{IH}$   $V_{IL}$ . Any slew rate can be used to drive the inhibit.

### 7.6 Reverse current

The power transistor used in the LD2980 has not an inherent diode connected between the regulator input and output. If the output is forced above the input, no current will flow from the output to the input across the series pass transistor. When a  $V_{REV}$  voltage is applied on the output, the reverse current measured, according to the test circuit in *Figure 22*, flows to the GND across the two feedback resistors. This current typical value is  $160 \mu A$ .  $R_1$  and  $R_2$  resistors are implanted type; typical values are, respectively,  $42.6 k\Omega$  and  $51.150 k\Omega$ .

## 10 Revision history

**Table 9. Document revision history**

Date	Revision	Changes
03-Jul-2006	13	Order codes updated and new template.
13-Nov-2006	14	Add part number LD2980ABU18TR.
06-Sep-2007	15	Add Table 1 on page 1.
14-Feb-2008	16	Modified: Table 1 on page 1.
11-Jul-2008	17	Modified: Table 1 on page 1.
06-Nov-2013	18	Document name changed from LD2980ABxx and LD2980Cxx to LD2980. Updated Table 1: Device summary, Table 5: Electrical characteristics for LD2980ABM, Table 6: Electrical characteristics for LD2980CM and Section 8: Package information. Added Section 9: Packaging information. Minor text changes in title, in features and description in cover page.
30-Aug-2017	19	Removed 5.0 V versions of device (updated Features, Table 1: Device summary, Table 5: Electrical characteristics for LD2980ABM, and Table 6: Electrical characteristics for LD2980C. Minor textual updates.
07-Dec-2017	20	Updated <a href="#">Table 1: Device summary</a> on the cover page.
