

THE DATASHEET OF LM348DT

Four UA741 quad bipolar operational amplifiers

Datasheet - production data

Description

The LM248 and LM348 consist of four independent, high-gain internally-compensated, low-power operational amplifiers which have been designed to provide functional characteristics identical to those of the familiar UA741 operational amplifier. In addition, the total supply current for all four amplifiers is compatible with the supply current of a single UA741 type operational amplifier. Other features include input offset current and input bias current which are much less than those of a standard UA741. Also, excellent isolation between amplifiers has been achieved by independently biasing each amplifier and using layout techniques which minimize thermal coupling.

The LM248 and LM348 can be used where multiple UA741 type amplifiers are being used and in applications where amplifier matching or high packaging density is required.

Features

- Low supply current: 0.53 mA per amplifier
- Class AB output stage: no crossover distortion
- Pin compatibility with LM124, LM224, LM324
- Low input offset voltage: 1 mV
- Low input offset current: 2 nA
- Low input bias current: 30 nA
- Gain bandwidth product: 1.3 MHz
- High degree of isolation between amplifiers: 120 dB
- Overload protection for inputs and outputs

2 Absolute maximum ratings

Table 2. Absolute maximum ratings

Symbol	Parameters	LM248	LM348	Unit
V_{CC}	Supply voltage	± 22		V
V_i	Input voltage ⁽¹⁾			
V_{id}	Differential input voltage	± 44		
	Output short-circuit duration ⁽²⁾	Infinite		-
P_{tot}	Power dissipation	500		mW
T_{oper}	Operating free-air temperature range	-40 to 105	0 to 70 C	°C
T_{stg}	Storage temperature range	-65 to 150		
ESD	HBM: human body model ⁽³⁾	200		V
	MM: machine model ⁽⁴⁾	50		
	CDM: charged device model ⁽⁵⁾	1.5		kV

1. For supply voltages less than the maximum value, the absolute maximum input voltage is equal to the supply voltage.
2. Any of the amplifier outputs can be shorted to ground indefinitely, however, more than one should not be simultaneously shorted as the maximum junction will be exceeded.
3. Human body model: 100pF discharged through a 1.5k Ω resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
4. Machine model: a 200pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
5. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.
