

**THE DATASHEET OF  
LTC1536IS8#TRPBF**

## FEATURES

- Simultaneously Monitors 5V, 3.3V and Adjustable Inputs
- Guaranteed Threshold Accuracy:  $\pm 0.75\%$
- Low Supply Current: 100 $\mu$ A
- Internal Reset Time Delay: 200ms
- Manual Pushbutton Reset Input
- Active Low and Active High Reset Outputs
- Active Low “Soft” Reset Output
- Power Supply Glitch Immunity
- Guaranteed Reset for Either  $V_{CC3} \geq 1V$  or  $V_{CC5} \geq 1V$
- Meets PCI  $t_{FAIL}$  Timing Specifications Rev 2.1
- 8-Pin SO and MSOP Packages

## APPLICATIONS

- PCI-Based Systems
- Desktop Computers
- Notebook Computers
- Intelligent Instruments
- Portable Battery-Powered Equipment
- Network Servers

## DESCRIPTION

The LTC<sup>®</sup>1536 is designed for PCI local bus applications with multiple supply voltages that require low power, small size, high speed and high accuracy supply monitoring.

For 3.3V and 5V supplies that are >500mV below spec or for the condition when the 5V supply falls below the 3.3V supply, the LTC1536 has a very fast response time capable of meeting the PCI  $t_{FAIL}$  timing specification. Tight 0.75% threshold accuracy and glitch immunity ensure reliable reset operation without false triggering.

The  $\overline{RST}$  output is guaranteed to be in the correct state for  $V_{CC5}$  or  $V_{CC3}$  down to 1V. The 100 $\mu$ A typical supply current makes the LTC1536 ideal for power-conscious systems.

A manual pushbutton reset input provides the ability to generate a very narrow “soft” reset pulse (100 $\mu$ s typ) or a 200ms reset pulse equivalent to a power-on reset. Both  $\overline{SRST}$  and  $\overline{RST}$  outputs are open-drain and can be OR-tied with other reset sources.

LTC, LTC and LT are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

**Power Fail Waveform  
 5V Dropping Below 3.3V by 300mV**

## ABSOLUTE MAXIMUM RATINGS (Notes 1, 2)

Terminal Voltage	Operating Temperature Range
$V_{CC3}, V_{CC5}, V_{CCA}$ ..... -0.3V to 7V	LTC1536C ..... 0°C to 70°C
$\overline{RST}, \overline{SRST}$ ..... -0.3V to 7V	LTC1536I ..... -40°C to 85°C
$\overline{RST}$ ..... -0.3V to $V_{CC3} + 0.3V$	Storage Temperature Range ..... -65°C to 150°C
$\overline{PBR}$ ..... -7V to 7V	Lead Temperature (Soldering, 10 sec) ..... 300°C

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** All voltage values are with respect to GND.

**Note 3:** The output pins  $\overline{SRST}$  and  $\overline{RST}$  have weak internal pull-ups to  $V_{CC3}$  of  $6\mu\text{A}$ . However, external pull-up resistors may be used when faster rise times are required.

**Note 4:** Conforms to PCI Local Bus Specification Rev 2.1, Sect. 4.3.2 for  $t_{FAIL}$ .

**Note 5:**  $V_{CC3}$  or  $V_{CC5}$  falling at  $-0.1\text{V}/\mu\text{s}$ , time measured from  $V_{RTX} - 500\text{mV}$  to  $\overline{RST}$  at 1.5V.

**Note 6:**  $V_{CC5}$  falling from 5V to 3V in  $\leq 10\text{ns}$ , time measured from  $V_{CC5} = (V_{CC3} - 300\text{mV})$  to  $\overline{RST}$  at 1.5V.

## APPLICATIONS INFORMATION

## Operation

The LTC1536 is a low power, high accuracy triple supply monitoring circuit. This reset generator has two basic functions: generation of a reset when power supplies are out of range, and generation of a reset or “soft” reset when the reset button is pushed. The LTC1536 has the added feature that when the reset supplies are grossly undervoltage there is a very short delay from undervoltage detect to assertion of  $\overline{RST}$ .

## Supply Monitoring

All three  $V_{CC}$  inputs must be above predetermined thresholds for 200ms before the reset output is released. The LTC1536 will assert reset during power-up, power-down and brownout conditions on any one or more of the  $V_{CC}$  inputs.

On power-up, either the  $V_{CC5}$  or  $V_{CC3}$  pin can power the drive circuits for the  $\overline{RST}$  pin. This ensures that  $\overline{RST}$  will

be low when either  $V_{CC5}$  or  $V_{CC3}$  reaches 1V. As long as any one of the  $V_{CC}$  inputs is below its predetermined threshold,  $\overline{RST}$  will stay a logic low. Once all of the  $V_{CC}$  inputs rise above their thresholds, an internal timer is started and  $\overline{RST}$  is released after 200ms.  $\overline{RST}$  outputs the inverted state of what is seen on  $\overline{RST}$ .

$\overline{RST}$  is reasserted whenever any one of the  $V_{CC}$  inputs drops below its predetermined threshold and remains asserted until 200ms after all of the  $V_{CC}$  inputs are above their thresholds.

On power-down, once any of the  $V_{CC}$  inputs drops below its threshold,  $\overline{RST}$  is held at a logic low. A logic low of 0.4V is guaranteed until  $V_{CC3}$  and  $V_{CC5}$  drops below 1V.

## Pushbutton Reset

The LTC1536 provides a pushbutton reset input pin. The  $\overline{PBR}$  input has an internal pull-up current source to  $V_{CC3}$ . If the  $\overline{PBR}$  pin is not used it can be left floating.

## APPLICATIONS INFORMATION

When the  $\overline{\text{PBR}}$  is pulled low for less than  $t_{\text{PB}} (\approx 2 \text{ sec})$ , a narrow ( $100\mu\text{s}$  typ) soft reset pulse is generated on the  $\overline{\text{SRST}}$  output pin after the button is released. The push-button circuitry contains an internal debounce counter which delays the output of the soft reset pulse by typically 20ms. This pin can be OR-tied to the  $\overline{\text{RST}}$  pin and issue what is called a “soft” reset. The  $\overline{\text{SRST}}$  thereby resets the microprocessor without interrupting the DRAM refresh cycle. In this manner DRAM information remains undisturbed. Alternatively,  $\overline{\text{SRST}}$  may be monitored by the processor to initiate a software-controlled reset.

When the  $\overline{\text{PBR}}$  pin is held low for longer than  $t_{\text{PB}} (\approx 2 \text{ sec})$ , a standard reset is generated. Once the 2-second period has elapsed, a reset signal is produced by the pushbutton logic, thereby clearing the reset counter. Once the  $\overline{\text{PBR}}$  pin is released, the reset counter begins counting the reset period (200ms nominal). Consequently, the reset outputs remain asserted for approximately 200ms after the button is released.

### Fast Undervoltage for PCI Applications

The LTC1536 is designed for PCI Local Bus applications that require reset to be asserted quickly in response to one or both of the power supply rails (5V and 3.3V) going out of spec. The spec for  $t_{\text{FAIL}}$  and  $t_{\text{PF}}$  are met with enough margin to give the designer the ability to add follow-on logic as needed by system requirements. The  $V_{\text{CCA}}$  pin can be used to monitor the “power good” signal and keep reset applied until both supplies are in spec and the power good signal is high.

### Glitch Immunity and Fast Undervoltage Detection

The LTC1536 achieves its high speed characteristics while maintaining glitch immunity by using two sets of comparators. The  $V_{\text{CC5}}$  and  $V_{\text{CC3}}$  sense inputs each have two comparators set at different thresholds. A slow, very accurate comparator monitors the supply for precision undervoltage detection. In parallel, but with a threshold 250mV lower than the precision threshold, is a very fast comparator that detects when the supply is quickly going out of specification. Because the fast comparator threshold is set 250mV above the PCI specification, typical values for  $t_{\text{FAIL}}$  can be negative.

### 3V or 5V Power Detect/Gate Drive

The LTC1536 for the most part is powered internally from the  $V_{\text{CC3}}$  pin. The exception is at the gate drive of the output FET on the  $\overline{\text{RST}}$  pin. On the gate to this FET is power detect circuitry used to detect and drive the gate from either the 3.3V pin or the 5V pin, whichever pin has the highest potential. This ensures the part pulls the  $\overline{\text{RST}}$  pin low as soon as either input pin is  $\geq 1\text{V}$ .

### Extended ESD Tolerance of the $\overline{\text{PBR}}$ Input Pin

The  $\overline{\text{PBR}}$  pin is susceptible to ESD since it can be brought out to a front panel in normal applications. The ESD tolerance of this pin can be increased by adding a resistor in series with the  $\overline{\text{PBR}}$  pin. A 10k resistor can increase the ESD tolerance of the  $\overline{\text{PBR}}$  pin to approximately 10kV. The  $\overline{\text{PBR}}$ 's internal pull-up current of  $7\mu\text{A}$  typical means there is only 70mV (150mV max) dropped across the resistor.

## TYPICAL APPLICATIONS

PCI Expansion Board  $\overline{\text{RST}}$  Generation

Dual Supply Monitor (3.3V and 5V,  $V_{\text{CCA}}$  Input Monitoring “Power Good”)

# TYPICAL APPLICATIONS

**Triple Supply Monitor (3.3V, 5V and Adjustable)**

**RESET Valid for V<sub>CC3</sub> Down to 0V in a Dual Supply Application**

**SRST Tied to RST and OR-Tying Other Sources to RST to Generate Reset and Reset**

**Using V<sub>CCA</sub> Tied to DC/DC Feedback Divider**

# PACKAGE DESCRIPTION

**MS8 Package**  
**8-Lead Plastic MSOP**  
 (Reference LTC DWG # 05-08-1660)

- NOTE:
1. DIMENSIONS IN MILLIMETER/(INCH)
  2. DRAWING NOT TO SCALE
  3. DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.152mm (.006") PER SIDE
  4. DIMENSION DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.152mm (.006") PER SIDE
  5. LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.102mm (.004") MAX
