

# MAX1818

## 500mA Low-Dropout Linear Regulator in SOT23

### General Description

The MAX1818 low-dropout linear regulator operates from a +2.5V to +5.5V supply and delivers a guaranteed 500mA load current with low 120mV dropout. The high-accuracy ( $\pm 1\%$ ) output voltage is preset at an internally trimmed voltage (see [Selector Guide](#)) or can be adjusted from 1.25V to 5.0V with an external resistive divider.

An internal PMOS pass transistor allows the low 125 $\mu$ A supply current to remain independent of load, making this device ideal for portable battery-operated equipment such as personal digital assistants (PDAs), cellular phones, cordless phones, base stations, and notebook computers.

Other features include an active-low open-drain reset output that indicates when the output is out of regulation, a 0.1 $\mu$ A shutdown, short-circuit protection, and thermal shutdown protection. The device is available in a miniature 800mW 6-pin SOT23 package.

### Applications

- Notebook Computers
- Cellular and Cordless Telephones
- Personal Digital Assistants (PDAs)
- Palmtop Computers
- Base Stations
- USB Hubs
- Docking Stations

### Pin Configuration

### Features

- Guaranteed 500mA Output Current
- Low 120mV Dropout at 500mA
- $\pm 1\%$  Output Voltage Accuracy
  - Preset at 1.5V, 1.8V, 2.0V, 2.5V, 3.3V, 5V
  - Adjustable from 1.25V to 5.0V
- Power OK Output
- Low 125 $\mu$ A Ground Current
- 0.1 $\mu$ A Shutdown Current
- Thermal Overload Protection
- Output Current Limit
- Tiny 800mW 6-Pin SOT23 Package

### Ordering Information

PART*	TEMP RANGE	PIN-PACKAGE
MAX1818EUT__+T	-40°C to +85°C	6 SOT23-6

\*Insert the desired two-digit suffix (see [Selector Guide](#)) into the blanks to complete the part number.

**Note:** The MAX1818 requires a special solder temperature profile described in the [Absolute Maximum Ratings](#) section.

T = Tape and reel.

#Denotes an RoHS-compliant package.

[Selector Guide](#) appears at end of data sheet.

### Typical Operating Circuit

## Absolute Maximum Ratings

IN, $\overline{\text{SHDN}}$ , POK, SET to GND.....	-0.3V to +6V	Operating Temperature Range.....	-40°C to +85°C
OUT to GND.....	-0.3V to ( $V_{\text{IN}} + 0.3\text{V}$ )	Junction Temperature.....	+150°C
Output Short-Circuit Duration.....	1min	Storage Temperature Range.....	-65°C to +150°C
Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ ) (Note 1)		Lead Temperature (soldering, 10s) (Note 2).....	+300°C
6-Pin SOT23 (derate 10mW/°C above +70°C).....	800mW		

**Note 1:** Thermal properties are specified with product mounted on PC board with one square-inch of copper area and still air. With minimal copper, the SOT23 package dissipates 712mW at +70°C. With a quarter square inch of copper, it will dissipate 790mW at +70°C. Copper should be equally shared between the IN, OUT, and GND pins.

**Note 2:** This device is constructed using a unique set of packaging techniques that imposes a limit on the thermal profile to which the device can be exposed during board-level solder attach and rework. The limit permits only the use of the solder profiles recommended in the industry standard specification, IPC JEDEC-J-STD-020A, paragraph 7.6, Table 3 for the IR/VPB and convection reflow. Preheating is required. Hand or wave soldering is not allowed.

*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

## Electrical Characteristics

( $V_{\text{IN}} = V_{\text{OUT}} + 500\text{mV}$  or  $V_{\text{IN}} = +2.5\text{V}$ , whichever is greater;  $\overline{\text{SHDN}} = \text{IN}$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_A = +25^\circ\text{C}$ .) (Note 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

POK Output High Leakage Current		POK = 5.5V, $T_A = +25^{\circ}C$		1	25	nA
		$T_A = +85^{\circ}C$		5		
POK Threshold		Rising edge, referred to $V_{OUT(NOMINAL)}$	90	93	96	%
<b>THERMAL PROTECTION</b>						
Thermal Shutdown Temperature	$T_{SHDN}$			170		$^{\circ}C$
Thermal Shutdown Hysteresis	$\Delta T_{SHDN}$			20		$^{\circ}C$

**Note 3:** All devices are 100% production tested at  $T_A = +25^{\circ}C$ . Limits over the operating temperature range are guaranteed by design.

**Note 4:** The Dropout Voltage is defined as  $V_{IN} - V_{OUT}$ , when  $V_{OUT}$  is 100mV below the value of  $V_{OUT}$  measured for  $V_{IN} = V_{OUT(NOM)} + 500mV$ . Since the minimum input voltage is 2.5V, this specification is only meaningful when  $V_{OUT(NOM)} > 2.5V$ . For  $V_{OUT(NOM)}$  between 2.5V and 3.5V, use the following equations: Typical Dropout =  $-93mV/V \times V_{OUT(NOM)} + 445mV$ ; Guaranteed Maximum Dropout =  $-137mV/V \times V_{OUT(NOM)} + 7004mV$ . For  $V_{OUT(NOM)} > 3.5V$ , Typical Dropout = 120mV; Maximum Dropout = 220mV.

Typical Operating Characteristics

( $V_{IN} = (V_{OUT} + 500mV)$  or  $+2.5V$ , whichever is greater;  $\overline{SHDN} = IN$ ,  $C_{IN} = 1\mu F$ ,  $C_{OUT} = 3.3\mu F$ ,  $T_A = +25^{\circ}C$ , unless otherwise noted.)

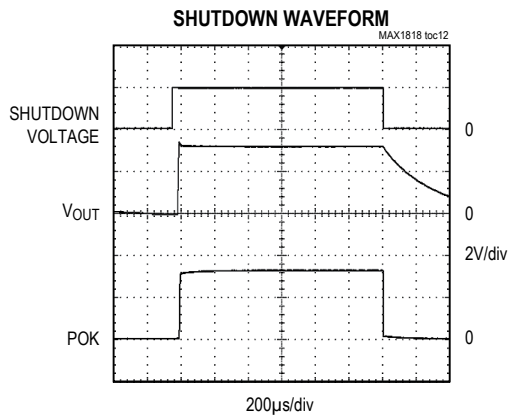

Typical Operating Characteristics (continued)

( $V_{IN} = (V_{OUT} + 500mV)$  or  $+2.5V$ , whichever is greater;  $\overline{SHDN} = IN$ ,  $C_{IN} = 1\mu F$ ,  $C_{OUT} = 3.3\mu F$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

Typical Operating Characteristics (continued)

( $V_{IN} = (V_{OUT} + 500mV)$  or +2.5V, whichever is greater;  $\overline{SHDN} = IN$ ,  $C_{IN} = 1\mu F$ ,  $C_{OUT} = 3.3\mu F$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

Pin Description

PIN	NAME	FUNCTION
1	IN	Regulator Input. Supply voltage can range from 2.5V to 5.5V. Bypass with a 1µF capacitor to GND (see <i>Capacitor Selection and Regulator Stability</i> ).
2	POK	Open-Drain POK Output. POK remains low while the output voltage ( $V_{OUT}$ ) is below the POK threshold. Connect a 100kΩ pull-up resistor from POK to OUT to obtain an output voltage.
3	$\overline{SHDN}$	Active-Low Shutdown Input. A logic low reduces supply current below 15µA. In shutdown, the POK output is low, and OUT is high impedance. Connect to IN for normal operation.
4	GND	Ground
5	SET	Voltage-Setting Input. Connect to GND for preset output. Connect to a resistive voltage-divider between OUT and GND to set the output voltage between 1.25V and 5.0V.
6	OUT	Regulator Output. Sources up to 500mA. Bypass with a 3.3µF low-ESR capacitor to GND. Use a 4.7µF capacitor for output voltages below 2V.

Detailed Description

The MAX1818 is a low-dropout, low-quiescent-current linear regulator designed primarily for battery-powered applications. The device supplies loads up to 500mA and is available with preset output voltages. As illustrated in Figure 1, the MAX1818 consists of a 1.25V reference, error amplifier, P-channel pass transistor, and internal feedback voltage-divider.

The 1.25V reference is connected to the error amplifier, which compares this reference with the feedback voltage and amplifies the difference. If the feedback voltage is lower than the reference voltage, the pass-transistor gate

is pulled lower, which allows more current to pass to the output and increases the output voltage. If the feedback voltage is too high, the pass-transistor gate is pulled up, allowing less current to pass to the output.

The output voltage is fed back through either an internal resistive divider connected to OUT or an external resistor network connected to SET. The Dual Mode comparator examines  $V_{SET}$  and selects the feedback path. If  $V_{SET}$  is below 50mV, the internal feedback path is used and the output is regulated to the factory-preset voltage.

Additional blocks include an output current limiter, thermal sensor, and shutdown logic.

Figure 1. Functional Diagram

**Internal P-Channel Pass Transistor**

The MAX1818 features a 0.25Ω P-channel MOSFET pass transistor. Unlike similar designs using PNP pass transistors, P-channel MOSFETs require no base drive, which reduces quiescent current. PNP-based regulators also waste considerable current in dropout when the pass transistor saturates, and use high base-drive currents under large loads. The MAX1818 does not suffer from these problems and consumes only 125µA of quiescent current under heavy loads as well as in dropout.

**Output Voltage Selection**

The MAX1818’s Dual Mode operation allows operation in either a preset voltage mode or an adjustable mode. Connect SET to GND to select the preset output voltage. The two-digit part number suffix identifies the output voltage (see *Selector Guide*). For example, the MAX1818EUT33 has a preset 3.3V output voltage.

The output voltage may also be adjusted by connecting a voltage-divider from OUT to SET to GND (Figure 2). Select R2 in the 25kΩ to 100kΩ range. Calculate R1 with the following equation:

$$R1 = R2 [(V_{OUT} / V_{SET}) - 1]$$

where  $V_{SET} = 1.25V$ , and  $V_{OUT}$  may range from 1.25V to 5.0V.

**Shutdown**

Pull  $\overline{SHDN}$  low to enter shutdown. During shutdown, the output is disconnected from the input and supply current drops to 0.1µA. When in shutdown, POK pulls low and OUT is high impedance. The capacitance and load at OUT determine the rate at which  $V_{OUT}$  decays.  $\overline{SHDN}$  can be pulled as high as 6V, regardless of the input and output voltage.

Figure 2. Adjustable Output Using External Feedback Resistors

Figure 3. Power Operating Regions: Maximum Output vs. Supply Voltage

**POK Output**

The power OK (POK) output pulls low when OUT is less than 93% of the nominal regulation voltage. Once OUT exceeds 93% of the nominal voltage, POK goes high impedance. POK is an open-drain N-channel output. To obtain a voltage output, connect a pullup resistor from POK to OUT. A 100kΩ resistor works well for most applications. POK can be used as a power-okay (POK) signal to a microcontroller (µC), or drive an external LED to indicate power failure. When the MAX1818 is shut down, POK is held low independent of the output voltage. If unused, leave POK grounded or unconnected.

**Current Limit**

The MAX1818 monitors and controls the pass transistor’s gate voltage, limiting the output current to 0.8A (typ). This current limit doubles when the output voltage is within 4% of the nominal value to improve performance with large load transients.

**Thermal Overload Protection**

Thermal overload protection limits total power dissipation in the MAX1818. When the junction temperature exceeds  $T_J = +170^\circ\text{C}$ , a thermal sensor turns off the pass transistor, allowing the IC to cool. The thermal sensor turns the pass transistor on again after the junction temperature

cools by  $20^\circ\text{C}$ , resulting in a pulsed output during continuous thermal overload conditions. Thermal overload protection protects the MAX1818 in the event of fault conditions. For continuous operation, do not exceed the absolute maximum junction-temperature rating of  $T_J = +150^\circ\text{C}$ .

**Operating Region and Power Dissipation**

The MAX1818’s maximum power dissipation depends on the thermal resistance of the IC package and circuit board, the temperature difference between the die junction and ambient air, and the rate of air flow. The power dissipated in the device is  $P = I_{OUT} \times (V_{IN} - V_{OUT})$ . The maximum allowed power dissipation is 800mW at  $T_A = +70^\circ\text{C}$  or:

$$P_{MAX} = (T_{J(MAX)} - T_A) / (\theta_{JC} + \theta_{CA})$$

where  $T_J - T_A$  is the temperature difference between the MAX1818 die junction and the surrounding air,  $\theta_{JC}$  is the thermal resistance of the junction to the case, and  $\theta_{CA}$  is the thermal resistance from the case through the PC board, copper traces, and other materials to the surrounding air. For best heatsinking, the copper area should be equally shared between the IN, OUT, and GND pins.

The MAX1818 delivers up to 0.5A RMS and operates with input voltages up to +5.5V, but not simultaneously. High output currents can only be sustained when input/output differential voltages are low, as shown in Figure 3.

## Applications Information

### Capacitor Selection and Regulator Stability

Capacitors are required at the MAX1818's input and output for stable operation over the full temperature range and with load currents up to 500mA. Connect a 1 $\mu$ F capacitor between IN and ground and a 3.3 $\mu$ F low-ESR capacitor between OUT and ground. For output voltages less than 2V, use a 4.7 $\mu$ F low-ESR output capacitor. The input capacitor ( $C_{IN}$ ) lowers the source impedance of the input supply. Reduce noise and improve load-transient response, stability, and powersupply rejection by using larger output capacitors, such as 10 $\mu$ F.

The output capacitor's ( $C_{OUT}$ ) equivalent series resistance (ESR) affects stability and output noise. Use output capacitors with an ESR of 0.1 $\Omega$  or less to ensure stability and optimum transient response. Surface-mount ceramic capacitors have very low ESR and are commonly available in values up to 10 $\mu$ F. Connect  $C_{IN}$  and  $C_{OUT}$  as close to the MAX1818 as possible to minimize the impact of PC board trace inductance.

### Noise, PSRR, and Transient Response

The MAX1818 is designed to operate with low dropout voltages and low quiescent currents in battery-powered systems while still maintaining good noise, transient response, and AC rejection. See the *Typical Operating Characteristics* for a plot of power-supply rejection ratio (PSRR) versus frequency. When operating from noisy sources, improved supply-noise rejection and transient response can be achieved by increasing the values of the input and output bypass capacitors and through passive filtering techniques.

## Selector Guide

PART AND SUFFIX	V <sub>OUT</sub>	SOT23 TOP MARK	SOT23 TOP MARK (RoHS COMPLIANT)
MAX1818EUT15	1.5V or Adj	AASO	ABZM
MAX1818EUT18	1.8V or Adj	AANU	ABZG
MAX1818EUT20	2.0V or Adj	AANV	ABZJ
MAX1818EUT25	2.5V or Adj	AANF	ABZK
MAX1818EUT33	3.3V or Adj	AANG	ABZH
MAX1818EUT50	5.0V or Adj	AANH	ABZL

The MAX1818 load-transient response (see *Typical Operating Characteristics*) shows two components of the output response: a DC shift from the output impedance due to the load current change, and the transient response. A typical transient response for a step change in the load current from 100mA to 500mA is 8mV. Increasing the output capacitor's value and decreasing the ESR attenuates the overshoot.

### Input-Output (Dropout) Voltage

A regulator's minimum input-to-output voltage differential (dropout voltage) determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the MAX1818 uses a P-channel MOSFET pass transistor, its dropout voltage is a function of drain-to-source on-resistance ( $R_{DS(ON)}$ ) multiplied by the load current (see *Typical Operating Characteristics*).

$$V_{DROPOUT} = V_{IN} - V_{OUT} = R_{DS(ON)} \times I_{OUT}$$

The MAX1818 ground current remains below 150 $\mu$ A in dropout.

## Chip Information

TRANSISTOR COUNT: 845

## Package Information

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	OUTLINE NO.
6 SOT23	U6F-6	<a href="#">21-0058</a>
6 SOT23#	U6FH-6	<a href="#">21-0058</a>
