## Regulated 5V Charge-Pump DC-DC Converter

MAX619

### General Description

The MAX619 step-up charge-pump DC-DC converter delivers a regulated 5V  $\pm 4\%$  output at 50mA over temperature. The input voltage range is 2V to 3.6V (two battery cells).

The complete MAX619 circuit fits into less than 0.1in<sup>2</sup> of board space because it requires only four external capacitors: two 0.22 $\mu$ F flying capacitors, and 10 $\mu$ F capacitors at the input and output.

Low operating supply current (150 $\mu$ A max) and low shutdown supply current (1 $\mu$ A max) make this device ideal for small, portable, and battery-powered applications. When shut down, the load is disconnected from the input.

The MAX619 is available in 8-pin DIP and SO packages.

### Applications

Two Battery Cells to 5V Conversion  
Local 3V-to-5V Conversion  
Portable Instruments & Handy-Terminals  
Battery-Powered Microprocessor-Based Systems  
5V Flash Memory Programmer  
Minimum Component DC-DC Converters  
Remote Data-Acquisition Systems  
Compact 5V Op-Amp Supply  
Regulated 5V Supply from Lithium Backup Battery  
Switching Drive Voltage for MOSFETs in  
Low-Voltage Systems

### Pin Configuration

### Features

- ♦ **Regulated 5V  $\pm 4\%$  Charge Pump**
- ♦ **Output Current Guaranteed over Temperature**  
20mA ( $V_{IN} \geq 2V$ )  
50mA ( $V_{IN} \geq 3V$ )
- ♦ **2V to 3.6V Input Range**
- ♦ **No Inductors; Very Low EMI Noise**
- ♦ **Ultra-Small Application Circuit (0.1in<sup>2</sup>)**
- ♦ **Uses Small, Inexpensive Capacitors**
- ♦ **500kHz Internal Oscillator**
- ♦ **Logic-Controlled 1 $\mu$ A Max Shutdown Supply Current**
- ♦ **Shutdown Disconnects Load from Input**
- ♦ **8-Pin DIP and SO Packages**

### Ordering Information

| PART      | TEMP. RANGE     | PIN-PACKAGE   |
|-----------|-----------------|---------------|
| MAX619CPA | 0°C to +70°C    | 8 Plastic DIP |
| MAX619CSA | 0°C to +70°C    | 8 SO          |
| MAX619C/D | 0°C to +70°C    | Dice*         |
| MAX619EPA | -40°C to +85°C  | 8 Plastic DIP |
| MAX619ESA | -40°C to +85°C  | 8 SO          |
| MAX619MJA | -55°C to +125°C | 8 CERDIP      |

\* Dice are specified at  $T_A = +25^\circ\text{C}$ .

## ABSOLUTE MAXIMUM RATINGS

$V_{IN}$  to GND .....-0.3V to +5.5V  
 $V_{OUT}$  to GND .....-0.3V to +5.5V  
 $SHDN$  to GND .....-0.3V to ( $V_{IN}$  + 0.3V)  
 $I_{OUT}$  Continuous (Note 1).....120mA  
 Continuous Power Dissipation ( $T_A$  = +70°C)  
   Plastic DIP (derate 9.09mW/°C above +70°C) .....727mW  
   SO (derate 5.88mW/°C above +70°C) .....471mW  
   CERDIP (derate 8.00mW/°C above +70°C) .....640mW

## Operating Temperature Ranges

MAX619C .....0°C to +70°C  
 MAX619E .....-40°C to +85°C  
 MAX619MJA .....-55°C to +125°C  
 Storage Temperature Range .....-65°C to +165°C  
 Lead Temperature (soldering, 10sec) .....+300°C

**Note 1:** The MAX619 is not short-circuit protected.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $V_{IN}$  = 2V to 3.6V,  $C_1$  =  $C_2$  = 0.22μF,  $C_3$  =  $C_4$  = 10μF,  $T_A$  =  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted. Typical values are at  $T_A$  = +25°C.)

### Detailed Description

#### Operating Principle

The MAX619 provides a regulated 5V output from a 2V to 3.6V (two battery cells) input. Internal charge pumps and external capacitors generate the 5V output, eliminating the need for inductors. The output voltage is regulated to  $5V \pm 4\%$  by a pulse-skipping controller that turns on the charge pump when the output voltage begins to droop.

To maintain the greatest efficiency over the entire input voltage range, the MAX619's internal charge pump operates as a voltage doubler when  $V_{IN}$  ranges from 3.0V to 3.6V, and as a voltage tripler when  $V_{IN}$  ranges from 2.0V to 2.5V. When  $V_{IN}$  ranges from 2.5V to 3.0V,

the MAX619 switches between doubler and tripler mode on alternating cycles, making a  $2.5 \times V_{IN}$  charge pump. To further enhance efficiency over the input range, an internal comparator selects the higher of  $V_{IN}$  or  $V_{OUT}$  to run the MAX619's internal circuitry. Efficiency with  $V_{IN} = 2V$  and  $I_{OUT} = 20mA$  is typically 80%.

Figure 1 shows a detailed block diagram of the MAX619. In tripler mode, when the S1 switches close, the S2 switches open and capacitors C1 and C2 charge up to  $V_{IN}$ . On the second half of the cycle, C1 and C2 are connected in series between IN and OUT when the S1 switches open and the S2 switches close, as shown in Figure 1. In doubler mode, only C2 is used.

During one oscillator cycle, energy is transferred from the input to the charge-pump capacitors, and then from the charge-pump capacitors to the output capacitor and load. The number of cycles within a given time frame increases as the load increases or as the input supply voltage decreases. In the limiting case, the charge pumps operate continuously, and the oscillator frequency is nominally 500kHz.

#### Shutdown Mode

The MAX619 enters low-power shutdown mode when SHDN is a logic high. SHDN is a CMOS-compatible input. In shutdown mode, the charge-pump switching action is halted, OUT is disconnected from IN, and  $V_{OUT}$  falls to 0V. Connect SHDN to ground for normal operation. When  $V_{IN} = 3.6V$ ,  $V_{OUT}$  typically reaches 5V in 0.5ms under no-load conditions after SHDN goes low.

## Applications Information

### Capacitor Selection

#### Charge-Pump Capacitors C1 and C2

The values of charge-pump capacitors C1 and C2 are critical to ensure adequate output current and avoid excessive peak currents. Use values in the range of 0.22 $\mu$ F to 1.0 $\mu$ F. Larger capacitors (up to 50 $\mu$ F) can be used, but larger capacitors will increase output ripple. Ceramic or tantalum capacitors are recommended.

#### Input and Output Capacitors, C3 and C4

The type of input bypass capacitor (C3) and output filter capacitor (C4) used is not critical, but it does affect performance. Tantalums, ceramics, or aluminum electrolytics are suggested. For smallest size, use Sprague 595D106X0010A2 surface-mount capacitors, which measure 3.7mm x 1.8mm (0.146in x 0.072in). For lowest ripple, use large, low effective-series-resistance (ESR) ceramic or tantalum capacitors. For lowest cost, use aluminum electrolytic or tantalum capacitors.

Figure 2 shows the component values for proper operation using minimal board space. The input bypass capacitor (C3) and output filter capacitor (C4) should both be at least 10 $\mu$ F when using aluminum electrolytics or Sprague's miniature 595D series of tantalum chip capacitors.

When using ceramic capacitors, the values of C3 and C4 can be reduced to 2 $\mu$ F and 1 $\mu$ F, respectively. If the input supply source impedance is very low, C3 may not be necessary.

Many capacitors exhibit 40% to 50% variation over temperature. Compensate for capacitor temperature coefficient by selecting a larger nominal value to ensure proper operation over temperature. Table 1 lists capacitor suppliers.

# Regulated 5V Charge-Pump DC-DC Converter

## Layout Considerations

The MAX619's high oscillator frequency makes good layout important. A good layout ensures stability and helps maintain the output voltage under heavy loads. For best performance, use very short connections to the capacitors.

## Paralleling Devices

Two MAX619s can be placed in parallel to increase output drive capability. The IN, OUT, and GND pins can be paralleled, but C1 and C2 pins cannot. The input bypass capacitor and output filter capacitor are, to some extent, shared when two circuits are paralleled. If the circuits are physically close together, it may be possible to use a single bypass and a single output capacitor, each with twice the value of the single circuit. If the MAX619s cannot be placed close together, use separate bypass and output capacitors. The amount of output ripple observed will determine whether single input bypass and output filter capacitors can be used.
