

2 μ A Low-Dropout Positive Voltage Regulator

Features

- 2.0 μ A Typical Quiescent Current
- Input Operating Voltage Range up to 10.0V
- Low-Dropout Voltage (LDO):
 - 120 mV (typical) @ 100 mA
 - 380 mV (typical) @ 200 mA
- High Output Current: 250 mA ($V_{OUT} = 5.0V$)
- High-Accuracy Output Voltage: $\pm 2\%$ (max)
- Low Temperature Drift: ± 100 ppm/ $^{\circ}C$ (typical)
- Excellent Line Regulation: 0.2%/V (typical)
- Package Options: 3-Pin SOT-23A, 3-Pin SOT-89, and 3-Pin TO-92
- Short Circuit Protection
- Standard Output Voltage Options:
 - 1.8V, 2.5V, 3.0V, 3.3V, 5.0V

Applications

- Battery-Powered Devices
- Battery-Powered Alarm Circuits
- Smoke Detectors
- CO² Detectors
- Smart Battery Packs
- PDAs
- Low-Quiescent Current Voltage Reference
- Cameras and Portable Video Equipment
- Pagers and Cellular Phones
- Solar-Powered Instruments
- Consumer Products
- Microcontroller Power

General Description

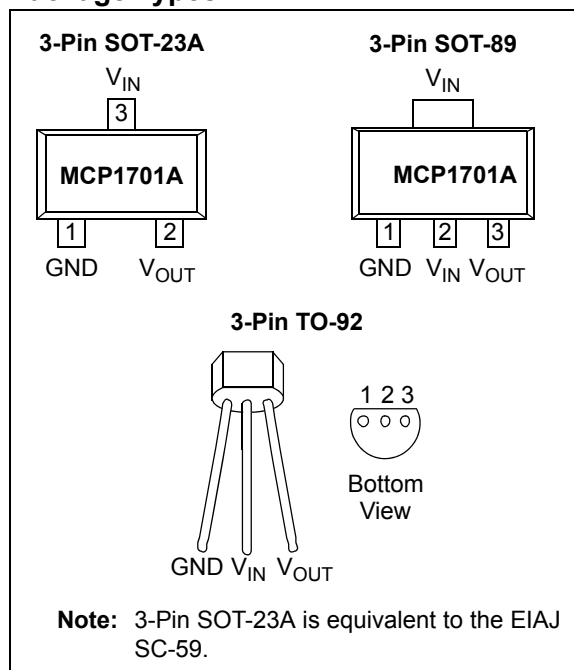

The MCP1701A is a family of CMOS low-dropout, positive voltage regulators that can deliver up to 250 mA of current while consuming only 2.0 μ A of quiescent current (typ.). The input operating range is specified up to 10V, making it ideal for lithium-ion (one or two cells), 9V alkaline and other two and three primary cell battery-powered applications.

The MCP1701A is capable of delivering 250 mA with an input-to-output voltage differential (dropout voltage) of 650 mV. The low-dropout voltage extends the battery operating lifetime. It also permits high currents in small packages when operated with minimum $V_{IN} - V_{OUT}$ differentials. The MCP1701A offers improved startup and transient response.

The MCP1701A has a tight tolerance output voltage regulation of $\pm 0.5\%$ (typ.) and very good line regulation at $\pm 0.2\%$. The LDO output is stable when using only 1 μ F of output capacitance of either tantalum or aluminum-electrolytic style capacitors. The MCP1701A LDO also incorporates short circuit protection to ensure maximum reliability.

Package options include the 3-pin SOT-23A, 3-pin SOT-89 and 3-Pin TO-92.

Package Types

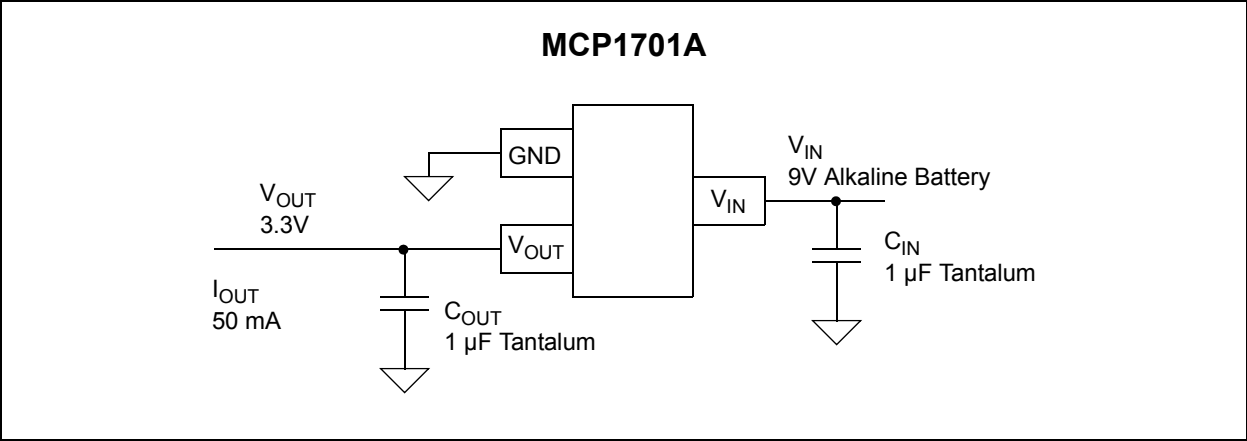

MCP1701A

Functional Block Diagram

Typical Application Circuits

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Input Voltage	+12V
Output Current (Continuous).....	$P_D / (V_{IN} - V_{OUT})$ mA
Output Current (peak)	500 mA
Output Voltage	(GND – 0.3V) to ($V_{IN} + 0.3V$)
Continuous Power Dissipation:	
3-Pin SOT-23A	150 mW
3-Pin SOT-89	500 mW
3-Pin TO-92	300 mW

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Electrical Specifications: Unless otherwise specified, all limits are established for an ambient temperature of $T_A = +25^\circ\text{C}$.						
Parameters	Sym	Min	Typ	Max	Units	Conditions
Output Voltage Regulation	V_{OUT}	$V_R - 2\%$	$V_R \pm 0.5\%$	$V_R + 2\%$	V	$I_{OUT} = 40 \text{ mA}$ (Note 1)
Maximum Output Current	I_{OUTMAX}	250 200 150 150 125 110	— — — — — —	— — — — — —	mA	$V_{OUT} = 5.0V$ ($V_{IN} = V_R + 1.0V$) $V_{OUT} = 4.0V$ $V_{OUT} = 3.3V$ $V_{OUT} = 3.0V$ $V_{OUT} = 2.5V$ $V_{OUT} = 1.8V$
Load Regulation (Note 3)	$\Delta V_{OUT} / V_{OUT}$	-1.60 -2.25 -2.72 -3.00 -3.60 -1.60	± 0.8 ± 1.1 ± 1.3 ± 1.5 ± 1.8 ± 0.8	+1.60 +2.25 +2.72 +3.00 +3.60 +1.60	%	$V_{OUT} = 5.0V, 1 \text{ mA} \leq I_{OUT} \leq 100 \text{ mA}$ $V_{OUT} = 4.0V, 1 \text{ mA} \leq I_{OUT} \leq 100 \text{ mA}$ $V_{OUT} = 3.3V, 1 \text{ mA} \leq I_{OUT} \leq 80 \text{ mA}$ $V_{OUT} = 3.0V, 1 \text{ mA} \leq I_{OUT} \leq 80 \text{ mA}$ $V_{OUT} = 2.5V, 1 \text{ mA} \leq I_{OUT} \leq 60 \text{ mA}$ $V_{OUT} = 1.8V, 1 \text{ mA} \leq I_{OUT} \leq 30 \text{ mA}$

Input Quiescent Current	I_Q	—	2.0	4.5	μA	$V_{IN} = V_R + 1.0V$
Line Regulation	$\frac{\Delta V_{OUT} \cdot 100}{\Delta V_{IN} \cdot V_{OUT}}$	—	0.2	0.3	%/V	$I_{OUT} = 40 \text{ mA}, (V_R + 1) \leq V_{IN} \leq 10.0V$
Input Voltage	V_{IN}	—	—	10	V	
Temperature Coefficient of Output Voltage	TCV_{OUT}	—	± 100	—	ppm/ $^\circ\text{C}$	$I_{OUT} = 40 \text{ mA}, -40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ (Note 2)
Output Rise Time	T_R	—	200	—	μs	10% V_R to 90% $V_R, V_{IN} = 0V$ to $V_R + 1V, R_L = 25\Omega$ resistive

- 1: V_R is the nominal regulator output voltage. For example: $V_R = 1.8V, 2.5V, 3.3V, 4.0V, 5.0V$. The input voltage $V_{IN} = V_R + 1.0V, I_{OUT} = 40 \text{ mA}$.
- 2: $TCV_{OUT} = (V_{OUT-HIGH} - V_{OUT-LOW}) \cdot 10^6 / (V_R \cdot \Delta\text{Temperature})$, $V_{OUT-HIGH}$ = Highest voltage measured over the temperature range. $V_{OUT-LOW}$ = Lowest voltage measured over the temperature range.
- 3: Load regulation is measured at a constant junction temperature using low duty cycle pulse testing.

MCP1701A

TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise specified, $T_A = +25^\circ\text{C}$.						
Parameters	Sym	Min	Typ	Max	Units	Conditions
Temperature Ranges						
Specified Temperature Range (I)	T_A	-40	—	+85	$^\circ\text{C}$	
Storage Temperature Range	T_A	-40	—	+125	$^\circ\text{C}$	
Package Thermal Resistances						
Thermal Resistance, 3L-SOT-23A	θ_{JA}	—	335	—	$^\circ\text{C/W}$	Minimum trace width single layer application
		—	230	—	$^\circ\text{C/W}$	Typical FR4, 4-layer application
Thermal Resistance, 3L-SOT-89	θ_{JA}	—	52	—	$^\circ\text{C/W}$	Typical, when mounted on 1 square inch of copper
Thermal Resistance, 3L-TO-92	θ_{JA}	—	131.9	—	$^\circ\text{C/W}$	EIA/JEDEC JESD51-751-7 4-layer board

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Notes: Unless otherwise specified, $V_{OUT} = 1.8V, 3.3V, 5.0V$, $T_A = +25^\circ C$, $C_{IN} = 1 \mu F$ Tantalum, $C_{OUT} = 1 \mu F$ Tantalum.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

Pin No. SOT-23A	Pin No. SOT-89	Pin No. TO-92	Name	Function
1	1	1	GND	Ground Terminal
2	3	3	V _{OUT}	Regulated Voltage Output
3	2	2	V _{IN}	Unregulated Supply Input

3.1 Ground Terminal (GND)

Regulator ground. Tie GND to the negative side of the output and the negative side of the input capacitor. Only the LDO bias current (2 μ A, typ.) flows out of this pin, there is no high current. The LDO output regulation is referenced to this pin. Minimize voltage drops between this pin and the negative side of the load.

3.2 Regulated Voltage Output (V_{OUT})

Connect V_{OUT} to the positive side of the load and the positive terminal of the output capacitor. The positive side of the output capacitor should be physically located as close as possible to the LDO V_{OUT} pin. The current flowing out of this pin is equal to the DC load current.

3.3 Unregulated Supply Input (V_{IN})

Connect the input supply voltage and the positive side of the input capacitor to V_{IN}. Like all low-dropout linear regulators, low source impedance is necessary for the stable operation of the LDO. The amount of capacitance required to ensure low source impedance will depend on the proximity of the input source capacitors or battery type. The input capacitor should be physically located as close as possible to the V_{IN} pin. For most applications, 1 μ F of capacitance will ensure stable operation of the LDO circuit. For applications that have load currents below 100 mA, the input capacitance requirement can be lowered. The type of capacitor used can be ceramic, tantalum or aluminum electrolytic. The low equivalent series resistance characteristics of the ceramic will yield better noise and PSRR performance at high frequency. The current flow into this pin is equal to the DC load current, plus the LDO bias current (2 μ A, typical).

MCP1701A

4.0 DETAILED DESCRIPTION

The MCP1701A is a low-quiescent current, precision, fixed-output voltage LDO. Unlike bipolar regulators, the MCP1701A supply current does not increase proportionally with load current.

4.1 Output Capacitor

A minimum of 1 μF output capacitor is required. The output capacitor should have an ESR greater than 0.1 Ω and less than 5 Ω , plus a resonant frequency above 1 MHz. Larger output capacitors can be used to improve supply noise rejection and transient response. Care should be taken when increasing C_{OUT} to ensure that the input impedance is not high enough to cause high input impedance oscillation.

4.2 Input Capacitor

A 1 μF input capacitor is recommended for most applications when the input impedance is on the order of 10 Ω . Larger input capacitance may be required for stability when operating from a battery input, or if there is a large distance from the input source to the LDO. When large values of output capacitance are used, the input capacitance should be increased to prevent high source impedance oscillations.

4.3 Overcurrent

The MCP1701 internal circuitry monitors the amount of current flowing through the P-channel pass transistor. In the event of a short circuit or excessive output current, the MCP1701 will act to limit the output current.

FIGURE 4-1: MCP1701A Block Diagram.

5.0 THERMAL CONSIDERATIONS

5.1 Power Dissipation

The amount of power dissipated internal to the LDO linear regulator is the sum of the power dissipation within the linear pass device (P-channel MOSFET) and the quiescent current required to bias the internal reference and error amplifier. The internal linear pass device power dissipation is calculated as shown in [Equation 5-1](#).

EQUATION 5-1:

$$P_D (\text{Pass Device}) = (V_{IN} - V_{OUT}) \times I_{OUT}$$

The internal power dissipation, as a result of the bias current for the LDO internal reference and error amplifier, is calculated as shown in [Equation 5-2](#).

EQUATION 5-2:

$$P_D (\text{Bias}) = V_{IN} \times I_{GND}$$

The total internal power dissipation is the sum of P_D (pass device) and P_D (bias).

EQUATION 5-3:

$$P_{TOTAL} = P_D (\text{Pass Device}) + P_D (\text{Bias})$$

For the MCP1701A, the internal quiescent bias current is so low (2 μ A, typ.) that the P_D (bias) term of the power dissipation equation can be ignored. The maximum power dissipation can be estimated by using the maximum input voltage and the minimum output voltage to obtain a maximum voltage differential between input and output. The next step would be to multiply the maximum voltage differential by the maximum output current.

EQUATION 5-4:

$$P_D = (V_{INMAX} - V_{OUTMIN}) \times I_{OUTMAX}$$

Given:

$$\begin{aligned} V_{IN} &= 3.3V \text{ to } 4.1V \\ V_{OUT} &= 3.0V \pm 2\% \\ I_{OUT} &= 1 \text{ mA to } 100 \text{ mA} \\ T_{AMAX} &= 55^\circ\text{C} \\ P_{MAX} &= (4.1V - (3.0V \times 0.98)) \times 100 \text{ mA} \end{aligned}$$

To determine the junction temperature of the device, the thermal resistance from junction-to-ambient must be known. The 3-pin SOT-23A thermal resistance from junction-to-air ($R_{\theta JA}$) is estimated to be approximately 335°C/W. The SOT-89 $R_{\theta JA}$ is estimated to be approximately 52°C/W when mounted on 1 square inch of copper. The $R_{\theta JA}$ will vary with physical layout, airflow and other application-specific conditions.

The device junction temperature is determined by calculating the junction temperature rise above ambient, then adding the rise to the ambient temperature.

EQUATION 5-5: JUNCTION TEMPERATURE – SOT-23A EXAMPLE:

$$\begin{aligned} T_J &= P_{DMAX} \times R_{\theta JA} + T_A \\ T_J &= 116.0 \text{ milliwatts} \times 335^\circ\text{C/W} + 55^\circ\text{C} \\ T_J &= 93.9^\circ\text{C} \end{aligned}$$

EQUATION 5-6: JUNCTION TEMPERATURE – SOT-89 EXAMPLE:

$$\begin{aligned} T_J &= 116.0 \text{ milliwatts} \times 52^\circ\text{C/W} + 55^\circ\text{C} \\ T_J &= 61^\circ\text{C} \end{aligned}$$

6.0 PACKAGING INFORMATION

6.1 Package Marking Information

① represents first voltage digit
1V, 2V, 3V, 4V, 5V, 6V

Ex: 3.xV = ③ ○ ○ ○

② represents first decimal place voltage (x.0 - x.9)

Ex: 3.4V = ③ ④ ○ ○

Symbol	Voltage	Symbol	Voltage
A	x.0	F	x.5
B	x.1	H	x.6
C	x.2	K	x.7
D	x.3	L	x.8
E	x.4	M	x.9

③ represents polarity
0 = Positive (fixed)

④ represents assembly lot number

①, ②, ③ & ④ = 701A (fixed)

⑤ represents first voltage digit (1-6)

⑥ represents first voltage decimal (0-9)

⑦ represents extra feature code: fixed: 0

⑧ represents regulation accuracy
2 = $\pm 2.0\%$ (standard)

⑨, ⑩, ⑪ & ⑫ represents assembly lot number

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

**QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==**

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona, Gresham, Oregon and Mountain View, California. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
