

## 7.5A Fast-Response LDO Regulator

### Features

- Fast Transient Response
- 7.5A Current Capability
- 700 mV Dropout Voltage at Full Load
- Low Ground Current
- Accurate 2% Guaranteed Tolerance
- “Zero” Current Shutdown Mode
- Adjustable Output Voltage

### Applications

- Pentium®, Pentium® Plus, and Power PC® Processor Supplies
- High-Efficiency “Green” Computer Systems
- High-Efficiency Linear Power Supplies
- High-Efficiency Switching Supply Post Regulator
- Battery-Powered Equipment

### Package Type

### General Description

The MIC29712 is a high-current, high-accuracy, low-dropout voltage regulator that features fast transient recovery from input voltage surges and output load current changes. This regulator uses a PNP pass element that features Microchip’s proprietary Super  $\beta$  PNP process.

The MIC29712 is an adjustable output voltage device. It is fully protected against overcurrent faults, reversed lead insertion, overtemperature operation, and positive and negative transient voltage spikes.

A TTL-compatible enable (EN) control pin supports external on/off control. If on/off control is not required, the device may be continuously enabled by connecting EN to IN.

The MIC29712 is available in the 5-pin TO-220 package with an operating junction temperature range of 0°C to +125°C.

For applications that require even lower dropout voltage or input voltage greater than 16V, see the MIC29752.

## Typical Application Circuit

## Functional Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Input Supply Voltage ( $V_{IN}$ ) (Note 1)	.....	-0.7V to +20V
Power Dissipation	.....	Internally Limited
Lead Temperature (Soldering, 5 sec.)	.....	+260°C
Storage Temperature ( $T_S$ )	.....	-65°C to +150°C
ESD Rating	.....	Note 2

### Operating Ratings ††

Junction Temperature ( $T_J$ )	.....	0°C to +125°C
Package Thermal Resistance		
TO-220 ( $\theta_{JC}$ )	.....	2°C/W
TO-220 ( $\theta_{JA}$ )	.....	55°C/W

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

†† **Notice:** The device is not guaranteed to function outside its operating ratings.

**Note 1:** The maximum continuous supply voltage is 16V.

**2:** Devices are ESD sensitive. Handling precautions are recommended.

## ELECTRICAL CHARACTERISTICS

**Electrical Characteristics:** All measurements at  $T_J = +25^\circ\text{C}$  unless otherwise noted. **Bold** values are guaranteed across the operating temperature range. Note 1

Parameter	Sym.	Min.	Typ.	Max.	Units	Conditions
Output Voltage	$V_{OUT}$	-2	—	2	%	$10\text{ mA} \leq I_{OUT} \leq 7.5\text{A}$ , $(V_{OUT} + 1\text{V}) \leq V_{IN} \leq 8\text{V}$ , Note 2
Line Regulation	$\frac{\Delta V_{OUT}}{V_{OUT}}$	—	0.06	0.5	%	$I_{OUT} = 10\text{ mA}$ , $(V_{OUT} + 1\text{V}) \leq V_{IN} \leq 8\text{V}$
Load Regulation	$\frac{\Delta V_{OUT}}{V_{OUT}}$	—	0.2	1	%	$V_{IN} = V_{OUT} + 1\text{V}$ , $10\text{ mA} \leq I_{OUT} \leq 7.5\text{A}$ , Note 2

## TEMPERATURE SPECIFICATIONS

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Operating Temperature Range	$T_J$	0	—	+125	°C	—
Lead Temperature	—	—	—	+260	°C	Soldering, 5 sec.
Storage Temperature	$T_S$	-65	—	+150	°C	—
<b>Package Thermal Resistances</b>						
Thermal Resistance, TO-220 5-Ld	$\theta_{JC}$	—	2	—	°C/W	—
Thermal Resistance, TO-220 5-Ld	$\theta_{JA}$	—	55	—	°C/W	—

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e.,  $T_A$ ,  $T_J$ ,  $\theta_{JA}$ ). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

## 2.0 TYPICAL PERFORMANCE CURVES

**Note:** The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number	Pin Name	Description
1	EN	Enable (Input): Logic-level ON/OFF control. Do not leave this pin floating.
2	IN	Unregulated Input: +16V maximum supply.
3	GND	Ground: Internally connected to tab (ground).
4	OUT	Regulated Output.
5	ADJ	Output Voltage Adjust: 1.240V feedback from external resistive divider.

## 4.0 APPLICATION INFORMATION

The MIC29712 is a high performance, low-dropout voltage regulator suitable for all moderate to high-current voltage regulator applications. Its 700 mV of dropout voltage at full load make it especially valuable in battery-powered systems and as high efficiency noise filters in post-regulator applications. Unlike older NPN-pass transistor designs, where the minimum dropout voltage is limited by the base-emitter voltage drop and collector-emitter saturation voltage, dropout performance of the PNP output of this device is limited merely by the low  $V_{CE}$  saturation voltage. Output regulation is excellent across the input voltage, output current, and temperature ranges.

A trade-off for the low dropout voltage is a varying base drive requirement. But Microchip's Super  $\beta$  PNP process reduces this drive requirement to merely 2% to 5% of the load current.

The MIC29712 regulator is fully protected from damage due to fault conditions. Current limiting is provided. The output current under overload conditions is limited to a constant value. Thermal shutdown disables the device when the die temperature exceeds the maximum safe operating temperature. Transient protection allows device (and load) survival even when the input voltage spike above and below nominal. The MIC29712 offers a logic level ON/OFF control: when disabled, the devices draw nearly zero current.

An additional feature of this regulator is a common pinout: a design's current requirement may change up or down, but use the same board layout because all of Microchip's high-current Super  $\beta$  PNP regulators have identical pinouts.

### 4.1 Thermal Design

Linear regulators are simple to use. The most complicated design parameters to consider are thermal characteristics. Thermal design requires the following application-specific parameters:

- Maximum ambient temperature,  $T_A$
- Output Current,  $I_{OUT}$
- Output Voltage,  $V_{OUT}$
- Input Voltage,  $V_{IN}$

First, calculate the power dissipation of the regulator from these values and the device parameters from this data sheet.

### EQUATION 4-1:

$$P_D = 1.03I_{OUT} \times (V_{IN} - V_{OUT})$$

Where:  
Ground current is approximated by 3% of  $I_{OUT}$ .

Then the heat sink thermal resistance is determined with the following formula:

### EQUATION 4-2:

$$\theta_{SA} = \frac{T_{J(MAX)} - T_A}{P_D} - (\theta_{JC} + \theta_{CS})$$

Where:  
 $T_{J(MAX)} \leq 125^\circ\text{C}$ .  
 $\theta_{CS}$  = Between  $0^\circ\text{C/W}$  and  $2^\circ\text{C/W}$ .

The heat sink may be significantly reduced in applications where the minimum input voltage is known and is large compared with the dropout voltage. Use a series input resistor to drop excessive voltage and distribute the heat between this resistor and the regulator. The low dropout properties of the Super  $\beta$  PNP regulators allow for significant reductions in regulator power dissipation and the associated heat sink without compromising performance. When this technique is employed, a capacitor of at least 0.1  $\mu\text{F}$  is needed directly between the input and regulator ground.

Please refer to [Application Note 9](#) for further details and examples on thermal design and heat sink specification.

### 4.2 Capacitor Requirements

For stability and minimum output noise, a capacitor on the regulator output is necessary. The value of this capacitor depends upon the output current; lower currents allow smaller capacitors. MIC29712 is stable with a minimum capacitor value of 47  $\mu\text{F}$  at full load.

This capacitor need not be an expensive low-ESR type: aluminum electrolytics are adequate. In fact, extremely low ESR capacitors may contribute to instability. Tantalum capacitors are recommended for systems where fast load transient response is important.

Where the regulator is powered from a source with a high AC impedance, a 0.1  $\mu\text{F}$  capacitor connected between input and GND is recommended. This capacitor should have good characteristics to above 250 kHz.

# MIC29712

## 4.3 Transient Response and 5V to 3.3V Conversion

The MIC29712 has excellent response to variations in input voltage and load current. By virtue of its low dropout voltage, this device does not saturate into dropout as readily as similar NPN-based designs. A 3.3V output Microchip LDO will maintain full speed and performance with an input supply as low as 4.2V, and will still provide some regulation with supplies down to 3.8V, unlike NPN devices that require 5.1V or more for good performance and become nothing more than a resistor under 4.6V of input. Microchip's PNP regulators provide superior performance in "5V to 3.3V" conversion applications, especially when all tolerances are considered.

## 4.4 Adjustable Regulator Design

The MIC29712 allows programming the output voltage anywhere between 1.25V and the 16V maximum operating rating. Two resistors are used. Resistors can be quite large, up to 100 kΩ, because of the very high input impedance and low bias current of the sense comparator. The resistor values are calculated using the following equation:

### EQUATION 4-3:

$$R1 = R2 \times \left( \frac{V_{OUT}}{1.240} - 1 \right)$$

Where:

$V_{OUT}$  = The desired output voltage.

**FIGURE 4-1:** Adjustable Regulator with Resistors.

## 4.5 Enable Input

The MIC29712 features an enable (EN) input that allows ON/OFF control of the device. Special design allows "zero" current drain when the device is disabled—only micro-amperes of leakage current flows. The EN input has TTL/CMOS compatible thresholds for simple interfacing with logic, or may be directly tied to  $V_{IN}$ . Enabling the regulator requires approximately 20 µA of current into the EN pin.

## 4.6 Minimum Load Current

The MIC29712 is specified between finite loads. If the output current is too small, leakage currents dominate and the output voltage rises. A 10 mA minimum load current is necessary for proper regulation.

**TABLE 4-1: MIC29712 RESISTOR VALUES**

Voltage	R1	R2
2.85V	100 kΩ	76.8 kΩ
2.9V	100 kΩ	75 kΩ
3.0V	100 kΩ	69.8 kΩ
3.1V	100 kΩ	66.5 kΩ
3.15V	100 kΩ	64.9 kΩ
3.3V	100 kΩ	60.4 kΩ
3.45V	100 kΩ	56.2 kΩ
3.525V	93.1 kΩ	51.1 kΩ
3.6V	100 kΩ	52.3 kΩ
3.8V	100 kΩ	48.7 kΩ
4.0V	100 kΩ	45.3 kΩ
4.1V	100 kΩ	43.2 kΩ

## 5.0 PACKAGING INFORMATION

### 5.1 Package Marking Information

#### 5-Lead TO-220\*

#### Example

<b>Legend:</b>	XX...X	Product code or customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.
	•, ▲, ▼	Pin one index is identified by a dot, delta up, or delta down (triangle mark).
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.	
	Underbar ( ) and/or Overbar ( ) symbol may not be to scale.

NOTES:

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
