

3-TERMINAL POSITIVE VOLTAGE REGULATOR

■ GENERAL DESCRIPTION

The **NJM78L00** series of 3-Terminal Positive Voltage Regulators are constructed using the New JRC Planar epitaxial process.

These regulators employ internal current limiting and thermal shut down, making them essentially indestructible. If adequate heat sinking is provided, they can deliver up to 100mA output current. They are intended as fixed voltage regulators in a wide range of applications including local or on-card regulation for elimination of noise and distribution problems associated with single-point regulation. In addition, they can be used with power pass elements to make high-current voltage regulators.

The **NJM78L00** series used as a Zener diode/resistor combination replacement, offers an effective output impedance improvement of typically two orders of magnitude, along with lower quiescent current and lower noise.

■ PACKAGE OUTLINE

NJM78L00UA
(SOT-89)

NJM78L00EA
(SOP8)
(5V, 9V, 12V Version Only)

■ FEATURES

- Internal Short Circuit Current Limit
- Internal Thermal Overload Protection
- Excellent Ripple Rejection
- Guaranteed 100mA Output Current
- Package Outline SOT-89, SOP8 JEDEC 150mil
- Bipolar Technology

■ PIN CONFIGURATION

NJM78L00UA

PIN CONFIGURATION

- 1. OUT
- 2. GND
- 3. IN

NJM78L00EA

PIN CONFIGURATION

- 1. OUT
- 2. GND
- 3. GND
- 4. NC
- 5. NC
- 6. GND
- 7. GND
- 8. IN

■ EQUIVALENT CIRCUIT

NJM78L00

■ ABSOLUTE MAXIMUM RATINGS

(T_a=25°C)

PARAMETER	SYMBOL	MAXIMUM RATINGS	UNIT
Input Voltage	V _{IN}	(78L02A to 78L09A) 30 (78L12A to 78L15A) 35 (78L18A to 78L24A) 40	V
Power Dissipation	P _D	(SOT-89) 350 (SOP8) 700(*1)	mW
Operating Temperature Range	T _{opr}	-40 to +85	°C
Storage Temperature Range	T _{stg}	-40 to +150	°C

(*1) Mounted on glass epoxy board

■ ELECTRICAL CHARACTERISTICS

(C_{IN}=0.33μF, C_O=0.1μF, T_J=25°C) Measurement is to be conducted is pulse testing.

NJM78L00

■ TEST CIRCUIT

1. Output Voltage Line Regulation, Load Regulation, Quiescent Current, Average Temperature Coefficient of Output Voltage, Output Noise Voltage, Peak Output/Short-Circuit Current

- Measurement is to be conducted in pulse testing.
- $I_Q = I_1 - I_O$

2. Ripple Rejection

$$RR = 20 \log_{10} \left(\frac{e_{in}}{e_o} \right) \text{ (dB)}$$

■ AMBIENT TEMPERATURE VS. POWER DISSIPATION

Power Dissipation vs. Ambient Temperature
($T_{opr} = -40^\circ\text{C} \sim +85^\circ\text{C}$, $T_j = \sim +150^\circ\text{C}$)

■ Input Capacitor C_{IN}

Input Capacitor C_{IN} is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended C_{IN} value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{IN} as shortest path as possible to avoid the problem.

■ Output Capacitor C_O

Output capacitor (C_O) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller C_O may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger C_O reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended C_O value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{OUT} as shortest path as possible for stable operation

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting C_O , recommend that have withstand voltage margin against output voltage and superior temperature characteristic though this product is designed stability works with wide range ESR of capacitor including low ESR products.
