VOLTAGE TRIPLER

■ GENERAL DESCRIPTION

The NJU7670 is a voltage tripler incorporated CR oscillator, voltage converter, reference voltage circuit and voltage regulator.

It can generates triple or double negative voltage of an operating voltage ranging from -2.6V to -6V.

The application circuit of tripler requires three capacitors, and doubler requires only two capacitors.

Furthermore, any kind of output voltage is available by the internal voltage regulator.

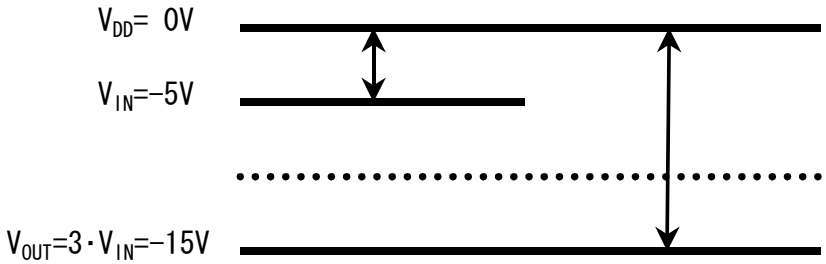
■ FUNCTIONAL DESCRIPTION

(1) Voltage Converter

The voltage converter generates double or triple voltage against V_{IN}.



(2) Voltage Reference Circuit

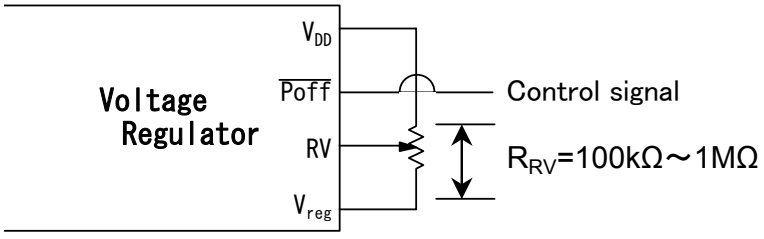
The voltage reference circuit is generating the reference voltage for a voltage regulator.

(3) Voltage Regulator

The voltage regurator output stabilized voltage which regulated by using the external resistor against double or triple voltage of the input voltage.

(3-1) Output-OFF Function

As this circuit incorporated output-off function, the voltage regulator output (ON/OFF) is performed by the signal come from system.



- ON/OFF Control for Vreg Terminal

$\overline{Poff}$ Level	Vreg Output
"H" (Connect to V_{DD})	ON
"L" (Connect to V_{IN})	OFF

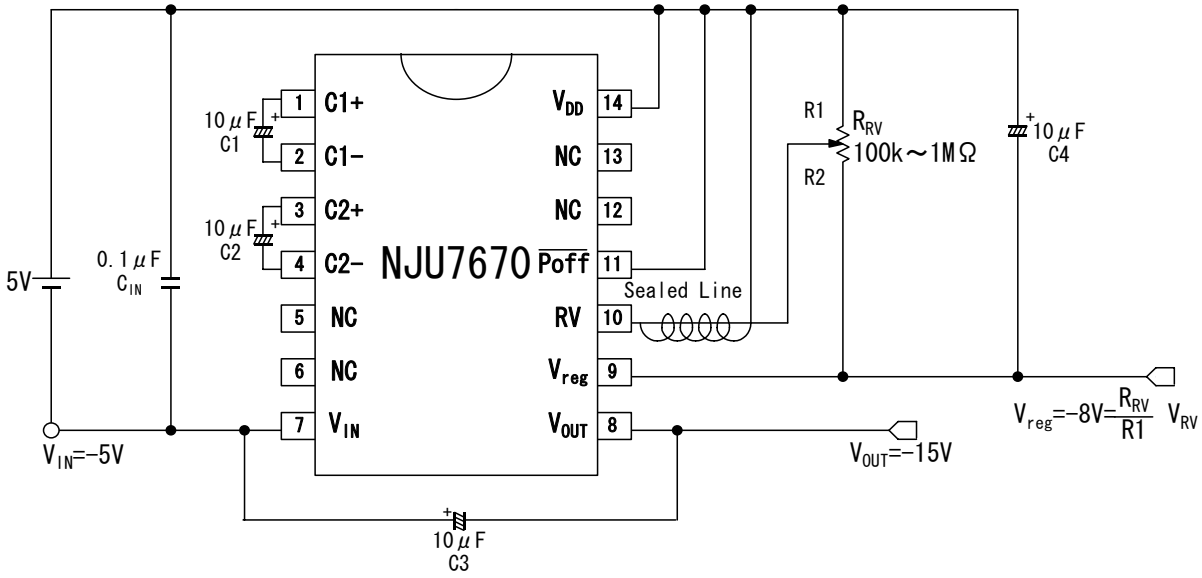
(3-2) Example of the Voltage Regulation

The voltage regulator has a output terminal which can be adjusted the output voltage to any kind of voltage by resistance R_{RV}.

As the RV terminal input impedance is high. Therefore special care against noise is required.

(Use a sealed line or others noise-proof method)

Tripler Operation + Voltage Regulator Operation



The IC may have a possibility not to operate properly with unstable supply voltage due to large transient current when the capacitor is charged or discharged.

The decoupling capacitor (C_{IN}) connect as close as possible to the IC.
