**NOTE:**

\*1:  $V_{OUT(T)}$  = Nominal output voltage.

\*3:  $V_{dif} = (V_{IN1} - V_{OUT1})$

$V_{IN1}$  :An Input Voltage when  $V_{OUT1}$  appears as the input voltage is gradually decreased.

$V_{OUT1}$  : A voltage equal to 98% of the output voltage when a stabilized ( $V_{OUT(T)} + 1.0V$ ) is input.

## TEST CIRCUITS

Circuit ① : Supply Current

Circuit ② : Output Voltage, Oscillation, Line Regulation, Dropout Voltage, Load Regulation

## OPERATIONAL EXPLANATION

With the XC6201 series regulator, in order to ensure the stabilized output voltage, we suggest that an output capacitor ( $C_L$ ) of  $1\ \mu\text{F}$  or more be connected between the output pin ( $V_{OUT}$ ) and the  $V_{SS}$  pin. For using low ESR capacitor (e.g. ceramic capacitors), please make sure that the output voltage is more than 1.7V. When the output voltage is from 1.3V to 1.6V, the output capacitor should be a tantalum capacitor with a capacitance of  $2.2\ \mu\text{F}$ . We also suggest an input capacitor ( $C_{IN}$ ) should be connected between the  $V_{IN}$  and the  $V_{SS}$  in order to stabilize input power source.

OUTPUT VOLTAGE	$C_{IN}$	$C_L$ (TANTALUM)	$C_L$ (LOW ESR)
1.3V~1.6V	$\geq 1.0\ \mu\text{F}$	$\geq 2.2\ \mu\text{F}$	—
1.7V~6.0V	$\geq 1.0\ \mu\text{F}$	$\geq 1.0\ \mu\text{F}$	$\geq 1.0\ \mu\text{F}$

## ■ NOTE ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded. When a voltage higher than the  $V_{IN}$  flows to the  $V_{OUT}$  like when using two power supplies, please connect a Schottky barrier diode between the  $V_{OUT}$  and the  $V_{IN}$  and do not exceed the  $V_{OUT}$  rating.
2. An oscillation may occur by the impedance between a power supply and the input of the IC. Where the impedance is  $10\ \Omega$  or more, please use an input capacitor ( $C_{IN}$ ) of at least  $1\ \mu\text{F}$ . In case of high output current, operation can be stabilized by increasing the input capacitor value. Also an oscillation may occur if the input capacitor value is smaller than the input impedance when the output capacitance ( $C_L$ ) is large. In such cases, operations can be stabilized by either increasing the input capacitor value or reducing the output capacitor value.
3. Please ensure that output current ( $I_{OUT}$ ) is less than  $P_d / (V_{IN} - V_{OUT})$  and do not exceed the rated power dissipation value ( $P_d$ ) of the package.
