

## 200 mA Low Dropout Regulator

### Features

- High Output Voltage Accuracy
- Variety of Output Voltages
- Guaranteed 200 mA Output
- Low Quiescent Current
- Low Dropout Voltage
- Extremely Tight Load and Line Regulation
- Very Low Temperature Coefficient
- Current and Thermal Limiting
- Reversed-Battery Protection
- Load-Dump Protection (Fixed Voltage Versions)
- Zero Off-Mode Current
- Logic-Controlled Electronic Enable
- Available in SOIC-8 and SOT-223 Packages

### Applications

- Cellular Telephones
- Laptop, Notebook, and Palmtop Computers
- Battery Powered Equipment
- PCMCIA  $V_{CC}$  and  $V_{PP}$  Regulation/Switching
- Barcode Scanners
- SMPS Post-Regulator and DC/DC Modules
- High-Efficiency Linear Power Supplies

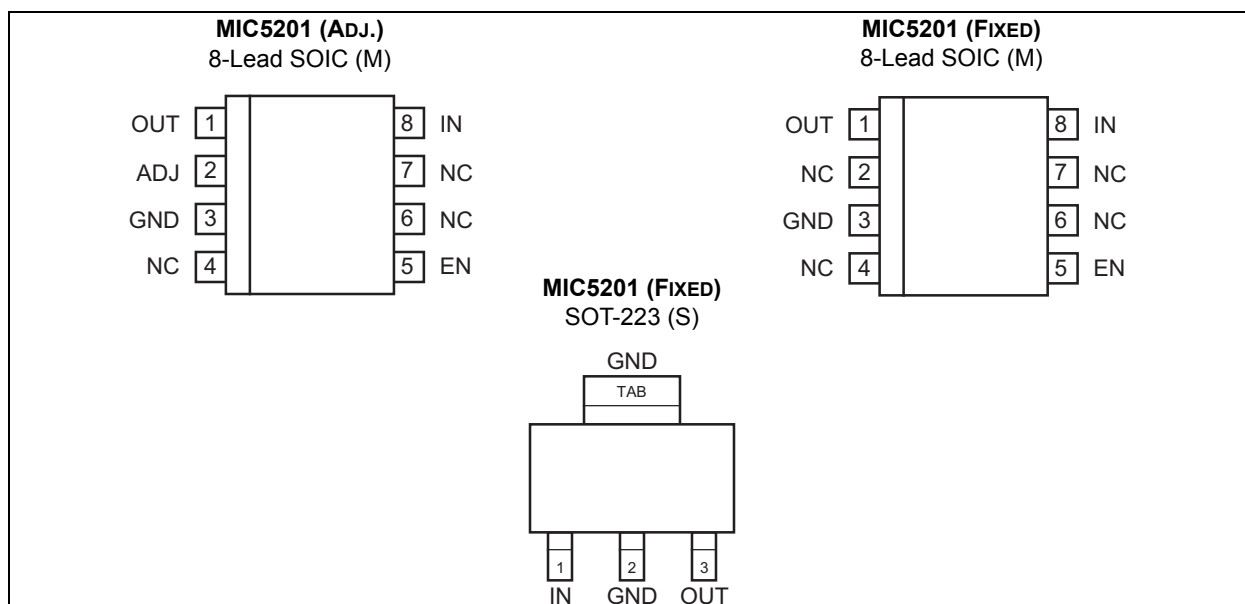

### General Description

The MIC5201 is an efficient linear voltage regulator with very low dropout voltage (typically 17 mV at light loads and 200 mV at 100 mA), and very low ground current (1 mA at 100 mA output), offering better than 1% initial accuracy with a logic compatible on-off switching input.

Designed especially for hand-held battery powered devices, the MIC5201 can be switched by a CMOS or TTL compatible enable signal. This enable control may be connected directly to  $V_{IN}$  if unneeded. When disabled, power consumption drops nearly to zero. The ground current of the MIC5201 increases only slightly in dropout, further prolonging battery life. Key MIC5201 features include current limiting, overtemperature shutdown, and protection against reversed battery.

The MIC5201 is available in several fixed voltages and accuracy configurations. It features the same pinout as the LT1121 with better performance. Other options are available; contact Microchip for details.

### Package Types

# MIC5201

## Typical Application Circuit

## Functional Diagrams

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Supply Input Voltage ( $V_{IN}$ ) Fixed.....	-20V to +60V
Supply Input Voltage ( $V_{IN}$ ) Adjustable.....	-20V to +20V
Enable Input Voltage ( $V_{EN}$ ) Fixed .....	-20V to +60V
Enable Input Voltage ( $V_{EN}$ ) Adjustable .....	-20V to +20V
Power Dissipation (Note 1) .....	Internally Limited

### Operating Ratings ‡

Supply Input Voltage ( $V_{IN}$ ) Fixed.....	+2.5V to +26V
Supply Input Voltage ( $V_{IN}$ ) Adjustable.....	+2.5V to +16V
Enable Input Voltage ( $V_{EN}$ ) .....	0V to $V_{IN}$

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

‡ **Notice:** The device is not guaranteed to function outside its operating ratings.

**Note 1:** The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_{J(max)}$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation at any ambient temperature is calculated using:  $P_{(max)} = (T_{J(max)} - T_A) \div \theta_{JA}$ . Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.

**TABLE 1-1: ELECTRICAL CHARACTERISTICS (Note 1) (CONTINUED)**

**Electrical Characteristics:**  $V_{IN} = V_{OUT} + 1V$ ;  $I_L = 100 \mu A$ ;  $C_L = 3.3 \mu F$ ;  $V_{EN} \geq 2.0V$ ;  $T_J = +25^\circ C$ , **bold** values indicate  $-40^\circ C \leq T_J \leq +85^\circ C$ ; unless noted.

Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
<b>Reference (MIC5201 Adjustable Version Only)</b>						
Reference Voltage	$V_{REF}$	1.223	1.242	1.255	V	—
		<b>1.217</b>	—	<b>1.267</b>		
Reference Voltage Temperature Coefficient	$\Delta V_{REF}/\Delta T$	—	20	—	ppm/ $^\circ C$	—

- Note 1:** Specification for packaged product only. Devices are ESD sensitive. Handling precautions recommended.
- Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.
  - Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1 mA to 200 mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.
  - Dropout Voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.
  - Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.
  - Thermal regulation is defined as the change in output voltage at a time “t” after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 200 mA load pulse at  $V_{IN} = 26V$  for fixed and  $V_{IN} = 16V$  for adjustable at  $t = 10 \text{ ms}$ .

# MIC5201

## TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Storage Temperature Range	$T_J$	-40	—	+125	°C	—
Lead Temperature	—	—	—	+260	°C	Soldering, 5 sec.
<b>Package Thermal Resistance</b>						
Thermal Resistance SOT-223	$\theta_{JC}$	—	15	—	°C/W	See <a href="#">Thermal Considerations Layout</a> for more information.
	$\theta_{JA}$	—	62	—		
Thermal Resistance 8-Ld SOIC	$\theta_{JA}$	—	160	—	°C/W	See <a href="#">Thermal Considerations Layout</a> for more information.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e.,  $T_A$ ,  $T_J$ ,  $\theta_{JA}$ ). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

## 2.0 TYPICAL PERFORMANCE CURVES

**Note:** The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number SOT-223	Pin Number SOIC-8 (Adj.)	Pin Number SOIC-8 (Fixed)	Pin Name	Description
3	1	1	OUT	Regulated output.
—	2	—	ADJ	Feedback input. Adjustable version only.
—	4, 6, 7	2, 4, 6, 7	NC	Not internally connected. Connect to ground plane for lowest thermal resistance.
2	3	3	GND	Ground.
—	5	5	EN	Enable (input): TTL-compatible input. High = enable. Low or open = off/disable.
1	8	8	V <sub>IN</sub>	Unregulated supply input.

## 4.0 APPLICATIONS INFORMATION

Figure 4-1 shows a basic fixed-voltage application with the unused enable input connected to  $V_{IN}$ .

**FIGURE 4-1:** Fixed Application.

Adjustable regulators require two resistors to set the output voltage. See Figure 4-2.

**FIGURE 4-2:** Adjustable Application.

Resistor values are not critical because ADJ (adjust) has a high impedance, but for best results use resistors of 470 k $\Omega$  or less.

### 4.1 Output Capacitors

A 1  $\mu$ F capacitor is recommended between the MIC5201 output and ground to prevent oscillations due to instability. Larger values serve to improve the regulator's transient response. Most types of tantalum or aluminum electrolytics will be adequate; film types will work, but are costly and therefore not recommended. Many aluminum electrolytics have electrolytes that freeze at about  $-30^{\circ}\text{C}$ , so solid tantalums are recommended for operation below  $-25^{\circ}\text{C}$ . The important parameters of the capacitor are an effective series resistance of about 5 $\Omega$  or less and a resonant frequency above 500 kHz. The value of this capacitor may be increased without limit.

At lower values of output current, less output capacitance is required for output stability. The capacitor can be reduced to 0.47  $\mu$ F for current below 10 mA or 0.33  $\mu$ F for currents below 1 mA.

### 4.2 Input Capacitors

A 1  $\mu$ F capacitor should be placed from the MIC5201 input to ground if there is more than 10 inches of wire between the input and the AC filter capacitor or if a battery is used as the input.

### 4.3 Noise Reduction Capacitors

On adjustable devices, a capacitor from ADJ to GND will decrease high-frequency noise on the output. See Figure 4-3.

**FIGURE 4-3:** Decreasing Output Noise.

### 4.4 Minimum Load

The MIC5201 will remain stable and in regulation with no load unlike many other voltage regulators. This is especially important in CMOS RAM keep-alive applications.

### 4.5 Dual-Supply Systems

When used in dual supply systems where the regulator load is returned to a negative supply, the output voltage must be diode clamped to ground.

### 4.6 Thermal Considerations Layout

The MIC5201-x.xYM (8-pin surface mount package) has the following thermal characteristics when mounted on a single layer copper-clad printed circuit board.

**TABLE 4-1: THERMAL CHARACTERISTICS**

PCB Dielectric	$\theta_{JA}$
FR4	160 $^{\circ}\text{C}/\text{W}$
Ceramic	120 $^{\circ}\text{C}/\text{W}$

Multilayer boards having a ground plane, wide traces near the pads, and large supply bus lines provide better thermal conductivity.

The "worst case" value of 160 $^{\circ}\text{C}/\text{W}$  assumes no ground plane, minimum trace widths, and a FR4 material board.

### 4.7 Nominal Power Dissipation and Die Temperature

The MIC5201-x.xYM at a  $+25^{\circ}\text{C}$  ambient temperature will operate reliably at up to 625 mW power dissipation when mounted in the "worst case" manner described above. At an ambient temperature of  $+55^{\circ}\text{C}$ , the device may safely dissipate 440 mW. These power levels are equivalent to a die temperature of  $+125^{\circ}\text{C}$ , the recommended maximum temperature for non-military grade silicon integrated circuits.

NOTES:

## APPENDIX A: REVISION HISTORY

### Revision A (February 2017)

- Converted Micrel document MIC5201 to Microchip data sheet DS20005718A.
- Minor text changes throughout.
- Removed all reference to discontinued leaded parts.
- Added  $\theta_{JA}$  value for SOT-223 package in Temperature Specifications section.

# MIC5201

NOTES:

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
