1.5A STEP-DOWN/STEP-UP/INVERTING DC-DC CONVERTER**AZ34063U****General Description**

The AZ34063U is a monolithic switching regulator control circuit which contains the primary functions required for DC-DC converters. This device consists of internal temperature compensated reference, voltage comparator, controlled duty cycle oscillator with active current limit circuit, driver and high current output switch.

The AZ34063U is specifically designed as a general DC-DC converter to be used in Step-Down, Step-Up and Voltage-Inverting applications with a minimum number of external components.

The AZ34063U is available in 2 packages: SOIC-8 and DIP-8.

Features

- Operation from 3.0V to 36V Input
- Low Standby Current
- Current Limiting
- Output Switch Current to 1.5A
- Output Voltage Adjustable
- Operation Frequency up to 180kHz
- Precision 2% Reference

Applications

- Battery Chargers
- ADSL Modems
- Hubs
- Negative Voltage Power Supplies

**1.5A STEP-DOWN/STEP-UP/INVERTING DC-DC CONVERTER****AZ34063U****Pin Description**

Pin Number	Pin Name	Function
1	Switch Collector	Internal switch transistor collector
2	Switch Emitter	Internal switch transistor emitter
3	Timing Capacitor	Timing Capacitor to control the switching frequency
4	GND	Ground pin for all internal circuits
5	Comparator Inverting Input	Inverting input pin for internal comparator
6	V _{CC}	Voltage supply
7	I _{PK} Sense	Peak Current Sense Input by monitoring the voltage drop across an external current sense resistor to limit the peak current through the switch
8	Driver Collector	Voltage driver collector

Ordering Information

Package	Temperature Range	Part Number	Marking ID	Packing Type
SOIC-8	-40 to 85°C	AZ34063UM-G1	34063UM-G1	Tube
		AZ34063UMTR-G1	34063UM-G1	Tape & Reel
DIP-8	-40 to 85°C	AZ34063UP-G1	AZ34063UP-G1	Tube

BCD Semiconductor's Pb-free products, as designated with "G1" suffix in the part number, are RoHS compliant and green.

Note 3: Low duty cycle pulse technique are used during test to maintain junction temperature as close to ambient temperature as possible.

Note 4: If the output switch is driven into hard saturation (non-Darlington configuration) at low switch currents ($\leq 300mA$) and high driver currents ($\geq 30mA$), it may take up to $2.0\mu s$ for it to come out of saturation. This condition will shorten the off time at frequencies 30KHz, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-Darlington configuration is used, the following output drive condition is recommended:

Figure 12. Operation Frequency vs. Temperature

Figure 13. Saturation Voltage vs. Temperature

Typical Applications

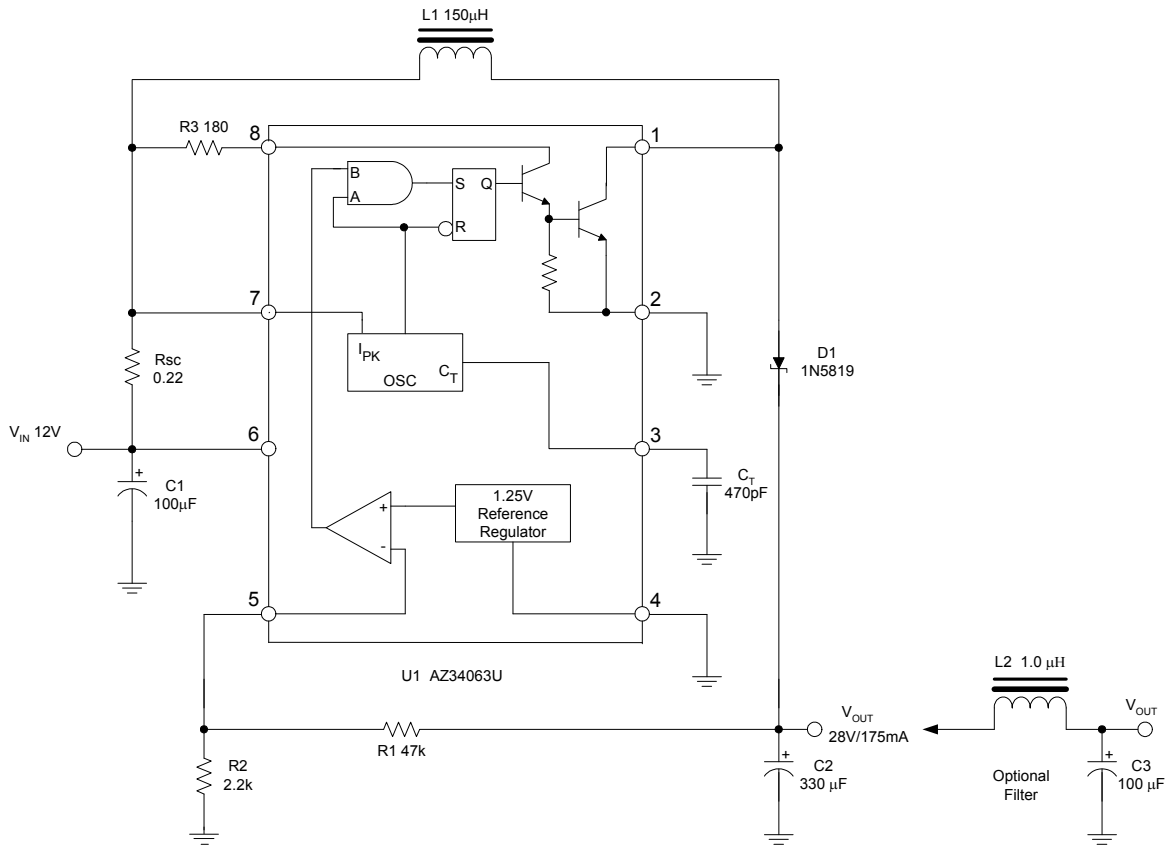

Figure 14. Step-Up Converter (Note 5)

Note 5: This is a typical step-up converter configuration. In the steady state, if the resistor divider voltage at pin 5 is greater than the voltage in the non-inverting input, which is 1.25V determined by the internal reference, the output of the comparator will go low. At the next switching period, the output switch will not conduct and the output voltage will eventually drop below its nominal voltage until the divider voltage at pin 5 is lower than 1.25V. Then the output of the comparator will go high, the output switch will be allowed to conduct. Since $V_{PIN5} = V_{OUT} \cdot R2 / (R1 + R2) = 1.25(V)$, the output voltage can be decided by $V_{OUT} = 1.25 \cdot (R1 + R2) / R2 (V)$.

Typical Applications (Continued)

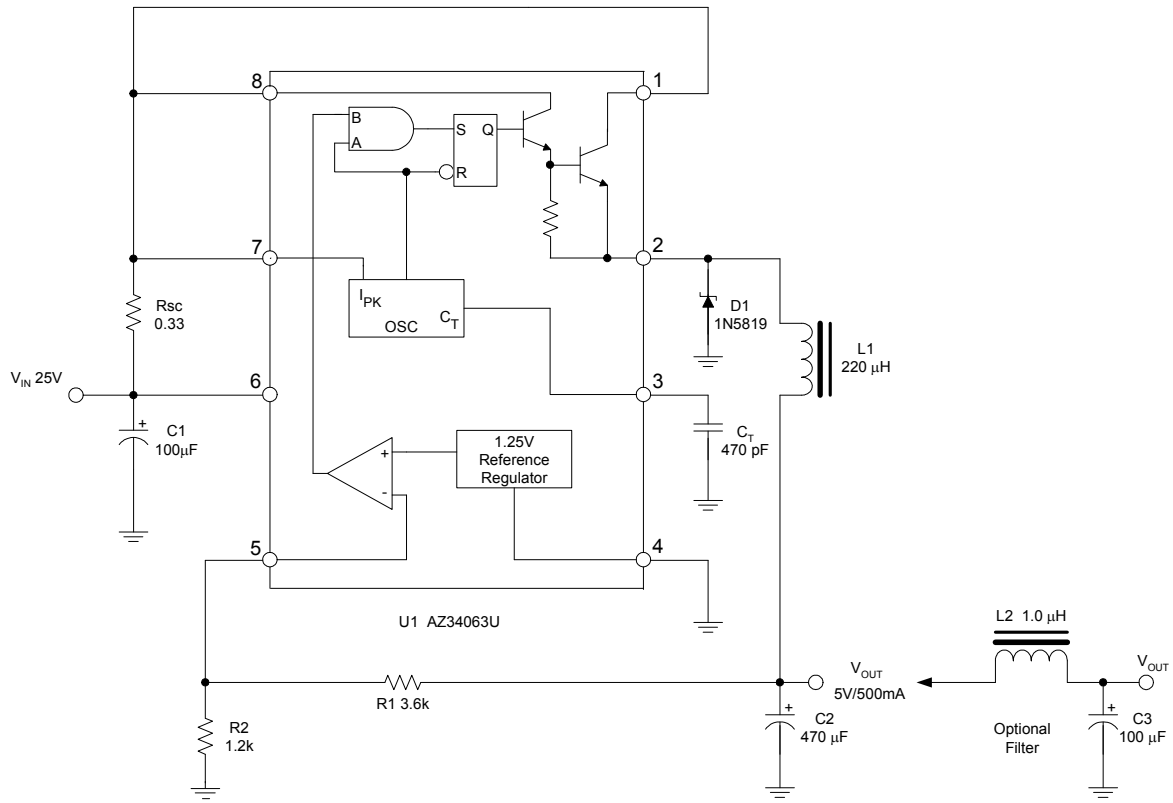

Figure 15. Step-Down converter (Note 6)

Note 6: This is a typical step-down converter configuration. The working process in the steady state is similar to step-up converter, $V_{PIN5} = V_{OUT} * R2 / (R1 + R2) = 1.25$ (V), the output voltage can be decided by $V_{OUT} = 1.25 * (R1 + R2) / R2$ (V).

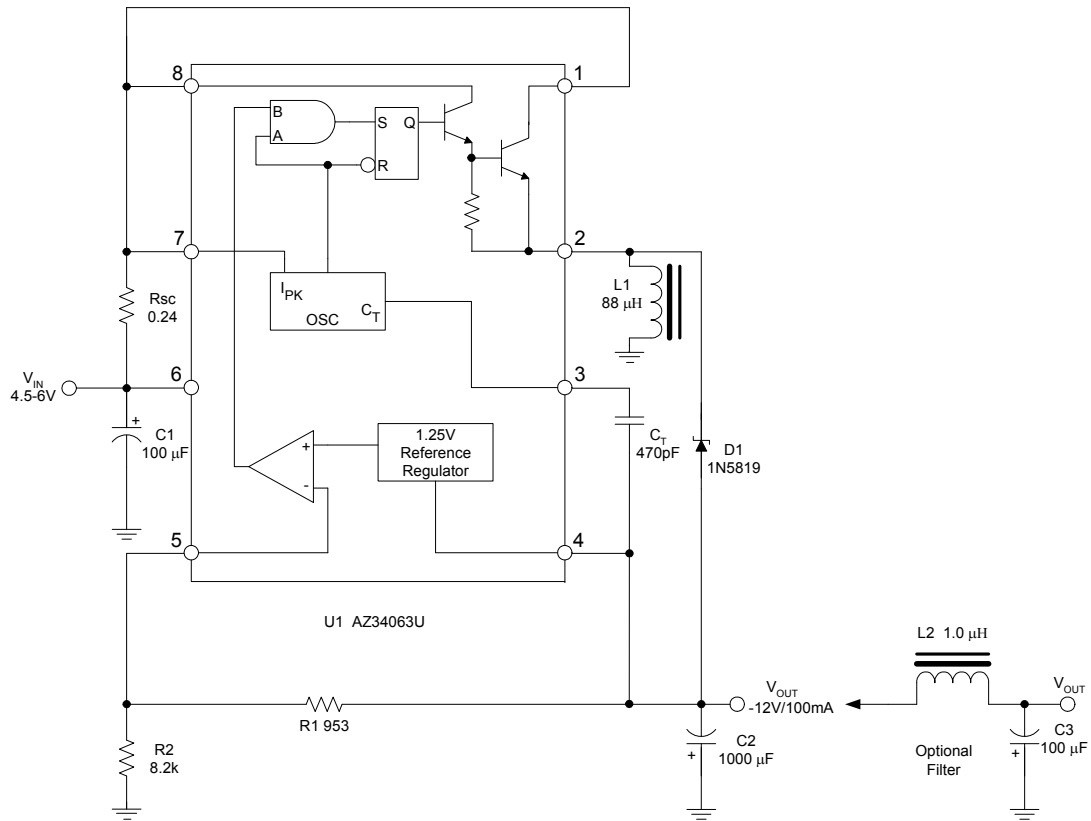

Typical Applications (Continued)

Figure 16. Voltage Inverting Converter (Note 7)

Note 7: This is a typical inverting converter configuration. The working process in the steady state is similar to step-up converter, the difference in this situation is that the voltage at the non-inverting pin of the comparator is equal to $1.25V + V_{OUT}$, then $V_{PIN5} = V_{OUT} * R2 / (R1 + R2) = 1.25V + V_{OUT}$, so the output voltage can be decided by $V_{OUT} = -1.25 * (R1 + R2) / R1$ (V).
