THE DATASHEET OF

AD5422ARE

Single Channel, 12-/16-Bit, Serial Input, Current Source and Voltage Output DACs, HART Connectivity

Data Sheet

AD5412/AD5422

FEATURES

- 12-/16-bit resolution and monotonicity
- Current output ranges: 4 mA to 20 mA, 0 mA to 20 mA, or 0 mA to 24 mA
- ±0.01% FSR typical total unadjusted error (TUE)
- ±3 ppm FSR/°C output drift
- Voltage output ranges: 0 V to 5 V, 0 V to 10 V, ±5 V, or ±10 V
  - 10% overrange
  - ±0.01% FSR typical TUE
  - ±2 ppm FSR/°C output drift
- Flexible serial digital interface
- On-chip output fault detection
- On-chip reference: 10 ppm/°C maximum
- Optional regulated DV_{CC} output
- Asynchronous clear function
- Power supply range
  - AV_{DD}: 10.8 V to 40 V
  - AV_{SS}: −26.4 V to −3 V/0 V
- Current loop compliance voltage: AV_{DD} – 2.5 V
- Temperature range: −40°C to +105°C
- TSSOP and LFCSP packages

APPLICATIONS

- Process controls
- Actuator controls
- PLC
- HART network connectivity (LFCSP package only)

GENERAL DESCRIPTION

The AD5412/AD5422 are low cost, precision, fully integrated 12-/16-bit digital-to-analog converters (DAC) offering a programmable current source and programmable voltage output designed to meet the requirements of industrial process control applications.

The output current range is programmable at 4 mA to 20 mA, 0 mA to 20 mA, or an overrange function of 0 mA to 24 mA.

The LFCSP version of this product has a CAP2 pin so that the HART signals can be coupled onto the current output of the AD5412/AD5422.

Voltage output is provided from a separate pin that can be configured to provide 0 V to 5 V, 0 V to 10 V, ±5 V, or ±10 V output ranges; an overrange of 10% is available on all ranges.

Analog outputs are short and open-circuit protected and can drive capacitive loads of 1 µF.

The device operates with an AV_{DD} power supply range from 10.8 V to 40 V. Current loop compliance voltage is 0 V to AV_{DD} − 2.5 V.

The flexible serial interface is SPI- and MICROWIRE™-compatible and can be operated in 3-wire mode to minimize the digital isolation required in isolated applications.

The device also includes a power-on-reset function, ensuring that the device powers up in a known state. The part also includes an asynchronous clear pin (CLEAR) that sets the outputs to zero-scale/midscale voltage output or the low end of the selected current range.

The total output error is typically ±0.01% in current mode and ±0.01% in voltage mode.

Table 1. Pin-Compatible Devices

Part No.	Description
AD5410	Single channel, 12-bit, serial input current source DAC
AD5420	Single channel, 16-bit, serial input current source DAC

TABLE OF CONTENTS

REVISION HISTORY

10/2017—Rev. N to Rev. O
Changed CP-40-10 to CP-40-1 ..... Throughout
Updated Outline Dimensions 43
Changes to Ordering Guide 44

3/2017—Rev. M to Rev. N
Changed CP-40-9 to CP-40-10 ..... Throughout
Changes to Table 6 13
Changes to Figure 85 43
Updated Outline Dimensions 43
Changes to Ordering Guide 44

7/2016—Rev. L to Rev. M
Changed −40°C to +85°C to −40°C to +105°C and CP-40-1 to CP-40-9 ..... Throughout
Changes to Table 2 5
Added Table 3; Renumbered Sequentially 9
Changes to Figure 6 14
Changes to Thermal and Supply Conditions Section 40
Updated Outline Dimensions 43
Changes to Ordering Guide 44

7/2015—Rev. K to Rev. L
Change to I_{OUT} to GND Parameter, Table 5 11
Change to Voltage and Current Output Ranges on the Same Terminal Section 37

3/2015—Rev. J to Rev. K
Changes to Table 4 9
Changes to Table 6 13
Changes to Power-On State Section 29

10/2014—Rev. I to Rev. J
Changes to Power-On State Section 29
Changes to Table 25 39

10/2013—Rev. H to Rev. I
Added Figure 34 and Figure 35; Renumbered Sequentially 18
Changes to Figure 78 37
Changes to Industrial Analog Output Module Section 39
Changes to Industrial HART Capable Analog Output Application Section 39

6/2013—Rev. G to Rev. H
Change to REFOUT Pin, Table 6 12
Changes to Voltage and Current Output Ranges on the Same Terminal Section and Figure 75 36

3/2013—Rev. F to Rev. G
Changed TSSOP_EP θ_{JA} from 42°C/W to 35°C/W, Changed LFCSP θ_{JA} from 28°C/W to 33°C/W, and Added Endnote 2 11
Added Figure 67 30
Changes to REXT Description; Table 15 31
Changes to Table 21 33
Changes to Thermal and Supply Considerations Section 38
Changes to Table 25 39

7/2012—Rev. E to Rev. F
Updated Outline Dimensions 40
Changes to Ordering Guide 40

5/2012—Rev. D to Rev. E
Reorganized Layout ..... Universal
Changes to Product Title 1
Changes to Features Section, Applications Section, and General Description Section; Added Companion Products Section 1
Changes to Figure 1 3
Change to Offset Error Temperature Coefficient (TC) Parameter, Table 1 4
Changes to Table 6 12
Changes to Power-On State Section 29
Added HART Communication Section and Figure 68, Renumbered Sequentially 33
Added Voltage and Current Output Ranges on the Same Terminal Section and Figure 74 36
Added Industrial HART Capable Analog Output Application Section 38
Added Figure 79 39

11/2011—Rev. C to Rev. D
Changes to Table 15 29

3/2010—Rev. B to Rev. C
Changes to AVSS to GND Parameter in Table 5 10

2/2010—Rev. A to Rev. B
Changes to Thermal and Supply Considerations Section and Table 25 36

8/2009—Rev. 0 to Rev. A
Changes to Table 2 4
Changes to Table 3 7
Changes to Introduction to Table 4 8
Changes to Introduction to Table 5 and to Table 5 10
Changes to Pin Configurations and Function Descriptions Section, Added Figure 6, Renumbered Subsequent Figures 11
Changes to Theory of Operation Section 26
Changes to Architecture Section 26
Changes to AD5412/AD5422 Features Section 31
Added I_{OUT} Filtering Capacitors (LFCSP Package) Section, Including Figure 69 to Figure 72 and Table 24 33
Changes to Thermal and Supply Considerations Section 36
Updated Outline Dimensions 38
Changes to Ordering Guide 39

5/2009—Revision 0: Initial Version

Pin Capacitance		10		pF	Per pin
DIGITAL OUTPUTS[3]					
SDO					
Output Low Voltage, V_{OL}			0.4	V	Sinking 200 µA
Output High Voltage, V_{OH}	DV_{CC} − 0.5			V	Sourcing 200 µA
High Impedance Leakage Current	−1		+1	µA	
High Impedance Output Capacitance		5		pF	
$\overline{FAULT}$					
Output Low Voltage, V_{OL}			0.4	V	10 kΩ pull-up resistor to DV_{CC}
Output Low Voltage, V_{OL}		0.6		V	At 2.5 mA
Output High Voltage, V_{OH}	3.6			V	10 kΩ pull-up resistor to DV_{CC}
POWER REQUIREMENTS					
AV_{DD}	10.8		40	V	
AV_{SS}	−26.4		0	V	
$\|AV_{SS}\| + AV_{DD}$	10.8		52.8	V	
DV_{CC}					
Input Voltage	2.7		5.5	V	Internal supply disabled
Output Voltage		4.5		V	DV_{CC}, which can be overdriven up to 5.5 V
Output Load Current[3]		5		mA	
Short-Circuit Current[3]		20		mA	
AI_{DD}					Outputs unloaded
		2.5	3	mA	Outputs disabled
		3.4	4	mA	Current output enabled
		3.9	4.4	mA	Voltage output enabled
AI_{SS}					Outputs unloaded
		0.24	0.3	mA	Outputs disabled
		0.5	0.6	mA	Current output enabled
		1.1	1.4	mA	Voltage output enabled
DI_{CC}			1	mA	$V_{IH} = DV_{CC}$, V_{IL} = GND
Power Dissipation		128		mW	AV_{DD} = 40 V, AV_{SS} = 0 V, outputs unloaded
		120		mW	AV_{DD} = +24 V, AV_{SS} = −24 V, outputs unloaded

[1] Temperature range: −40°C to +105°C; typical at +25°C.
[2] When the AD5412/AD5422 is powered with AV_{SS} = 0 V, INL for the 0 V to 5 V and 0 V to 10 V ranges is measured beginning from Code 256 for the AD5422 and Code 16 for the AD5412.
[3] Guaranteed by design and characterization; not production tested.
[4] For 0 mA to 20 mA and 0 mA to 24 mA ranges, INL is measured beginning from Code 256 for the AD5422 and Code 16 for the AD5412.
[5] The on-chip reference is production trimmed and tested at 25°C and 85°C. It is characterized from −40°C to +105°C.

AV_{DD} = 15 V to 26.4 V, AV_{SS} = −26.4 V to −3 V/0 V, AV_{DD} + |AV_{SS}| < 52.8 V, GND = 0 V, REFIN = 5 V external; DV_{CC} = 2.7 V to 5.5 V. V_{OUT}: R_{LOAD} = 1 kΩ, C_L = 200 pF, I_{OUT}: R_{LOAD} = 350 Ω; all specifications T_{MIN} to T_{MAX}, unless otherwise noted. Voltage over range enabled.

ABSOLUTE MAXIMUM RATINGS

T_A = 25°C, unless otherwise noted. Transient currents of up to 80 mA do not cause SCR latch-up.

Table 6.

Parameter	Rating
AV_{DD} to GND	−0.3 V to +48 V
AV_{SS} to GND	+0.3 V to −28 V
AV_{DD} to AV_{SS}	−0.3 V to +60 V
DV_{CC} to GND	−0.3 V to +7 V
Digital Inputs to GND	−0.3 V to DV_{CC} + 0.3 V or 7 V (whichever is less)
Digital Outputs to GND	−0.3 V to DV_{CC} + 0.3 V or 7 V (whichever is less)
REFIN/REFOUT to GND	−0.3 V to +7 V
V_{OUT} to GND	AV_{SS} to AV_{DD}
I_{OUT} to GND	AV_{SS} to AV_{DD}
Operating Temperature Range (T_A)	
Industrial[1]	−40°C to +105°C
Storage Temperature Range	−65°C to +150°C
Junction Temperature (T_J max)	125°C
24-Lead TSSOP_EP Package	
θ_{JA} Thermal Impedance[2]	35°C/W
40-Lead LFCSP Package	
θ_{JA} Thermal Impedance[2]	33°C/W
Power Dissipation	$(T_J \text{ max} - T_A)/\theta_{JA}$
Lead Temperature	JEDEC industry standard
Soldering	J-STD-020

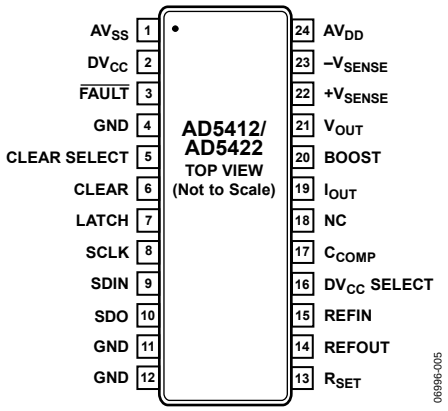
[1] Power dissipated on chip must be derated to keep the junction temperature below 125°C, assuming that the maximum power dissipation condition is sourcing 24 mA into GND from I_{OUT} with a 4 mA on-chip current.
[2] Thermal impedance simulated values are based on JEDEC 2S2P thermal test board with thermal vias. See JEDEC JESD51.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

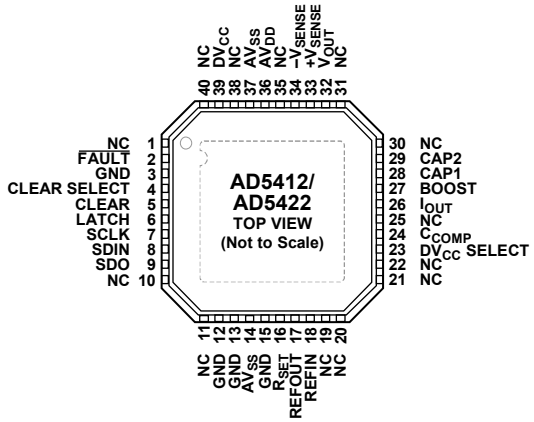
ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS



NOTES
1. NC = NO CONNECT
2. THE PADDLE CAN BE CONNECTED TO 0V IF THE OUTPUT VOLTAGE RANGE IS UNIPOLAR. THE PADDLE CAN BE LEFT ELECTRICALLY UNCONNECTED PROVIDED THAT A SUPPLY CONNECTION IS MADE AT THE AV_{SS} PIN. IT IS RECOMMENDED THAT THE PADDLE BE THERMALLY CONNECTED TO A COPPER PLANE FOR ENHANCED THERMAL PERFORMANCE.

Figure 5. TSSOP Pin Configuration



NOTES
1. NC = NO CONNECT.
2. THE EXPOSED PADDLE CAN BE CONNECTED TO 0V IF THE OUTPUT VOLTAGE RANGE IS UNIPOLAR. THE EXPOSED PADDLE CAN BE LEFT ELECTRICALLY UNCONNECTED PROVIDED THAT A SUPPLY CONNECTION IS MADE AT THE AV_{SS} PIN. IT IS RECOMMENDED THAT THE PADDLE BE THERMALLY CONNECTED TO A COPPER PLANE FOR ENHANCED THERMAL PERFORMANCE.

Figure 6. LFCSP Pin Configuration

Table 7. Pin Function Descriptions

Pin No.			
TSSOP	**LFCSP**	**Mnemonic**	**Description**
1	14, 37	AV_{SS}	Negative Analog Supply Pin. Voltage ranges from −3 V to −24 V. This pin can be connected to 0 V if the output voltage range is unipolar.
2	39	DV_{CC}	Digital Supply Pin. Voltage ranges from 2.7 V to 5.5 V. This pin can also be configured as a 4.5 V LDO output by leaving the DV_{CC} SELECT pin floating.
3	2	$\overline{FAULT}$	Fault Alert. This pin is asserted low when an open circuit is detected in current mode or an overtemperature is detected. Open drain output must be connected to a pull-up resistor.
4, 12	3, 15	GND	These pins must be connected to 0 V.
18	1, 10, 11, 19, 20, 21, 22, 25, 30, 31, 35, 38, 40	NC	No Connection. Do not connect to these pins.
5	4	CLEAR SELECT	Selects the voltage output clear value, either zero-scale or midscale code (see Table 22).
6	5	CLEAR	Active High Input. Asserting this pin sets the current output to the bottom of the selected range or sets the voltage output to the user selected value (zero-scale or midscale).
7	6	LATCH	Positive Edge Sensitive Latch. A rising LATCH edge parallel loads the input shift register data into the DAC register, also updating the output.
8	7	SCLK	Serial Clock Input. Data is clocked into the shift register on the rising edge of SCLK. This operates at clock speeds of up to 30 MHz.
9	8	SDIN	Serial Data Input. Data must be valid on the rising edge of SCLK.
10	9	SDO	Serial Data Output. Used to clock data from the serial register in daisy-chain or readback mode. Data is valid on the rising edge of SCLK (see Figure 3 and Figure 4).
11	12, 13	GND	Ground Reference Pin.
13	16	R_{SET}	An external, precision, low drift 15 kΩ current setting resistor can be connected to this pin to improve the I_{OUT} temperature drift performance. See the AD5412/AD5422 Features section.
14	17	REFOUT	Internal Reference Voltage Output. REFOUT = 5 V ± 5 mV.
15	18	REFIN	External Reference Voltage Input. Reference input range is 4 V to 5 V. REFIN = 5 V for a specified performance.

Pin No.			
TSSOP	**LFCSP**	**Mnemonic**	**Description**
16	23	DV_{CC} SELECT	When connected to GND, this pin disables the internal supply, and an external supply must be connected to the DV_{CC} pin. Leave this pin unconnected to enable the internal supply. In this case, it is recommended to connect a 0.1 µF capacitor between DV_{CC} and GND. See the AD5412/AD5422 Features section.
17	24	C_{COMP}	Optional compensation capacitor connection for the voltage output buffer. Connecting a 4 nF capacitor between this pin and the V_{OUT} pin allows the voltage output to drive up to 1 µF. It should be noted that the addition of this capacitor reduces the bandwidth of the output amplifier, increasing the settling time.
19	26	I_{OUT}	Current Output Pin.
20	27	BOOST	Optional External Transistor Connection. Connecting an external transistor reduces the power dissipated in the AD5412/AD5422. See the AD5412/AD5422 Features section.
N/A	28, 29	CAP1, CAP2	Connection for Optional Output Filtering Capacitor. See the AD5412/AD5422 Features section.
21	32	V_{OUT}	Buffered Analog Output Voltage. The output amplifier is capable of directly driving a 1 kΩ, 2000 pF load.
22	33	$+V_{SENSE}$	Sense connection for the positive voltage output load connection.
23	34	$-V_{SENSE}$	Sense connection for the negative voltage output load connection.
24	36	AV_{DD}	Positive Analog Supply Pin. Voltage ranges from 10.8 V to 60 V.
25 (EPAD)	41 (EPAD)	Exposed paddle	Negative Analog Supply Pin. Voltage ranges from –3 V to –24 V. This paddle can be connected to 0 V if the output voltage range is unipolar. The paddle can be left electrically unconnected provided that a supply connection is made at the AV_{SS} pin. It is recommended that the paddle be thermally connected to a copper plane for enhanced thermal performance.

TERMINOLOGY

Relative Accuracy or Integral Nonlinearity (INL)
For the DAC, relative accuracy, or INL, is a measure of the maximum deviation, in LSBs, from a straight line passing through the endpoints of the DAC transfer function. A typical INL vs. code plot can be seen in Figure 17.

Differential Nonlinearity (DNL)
DNL is the difference between the measured change and the ideal 1 LSB change between any two adjacent codes. A specified differential nonlinearity of ±1 LSB maximum ensures monotonicity. This DAC is guaranteed monotonic by design. A typical DNL vs. code plot can be seen in Figure 19.

Monotonicity
A DAC is monotonic if the output either increases or remains constant for increasing digital input code. The AD5412/AD5422 are monotonic over their full operating temperature range.

Bipolar Zero Error
Bipolar zero error is the deviation of the analog output from the ideal half-scale output of 0 V when the DAC register is loaded with 0x8000 (straight binary coding) or 0x0000 (twos complement coding). A plot of bipolar zero error vs. temperature can be seen in Figure 28.

Bipolar Zero Temperature Coefficient (TC)
Bipolar zero TC is a measure of the change in the bipolar zero error with a change in temperature. It is expressed in ppm FSR/°C.

Full-Scale Error
Full-scale error is a measure of the output error when full-scale code is loaded to the DAC register. Ideally, the output should be full-scale − 1 LSB. Full-scale error is expressed in percent of full-scale range (% FSR).

Negative Full-Scale Error/Zero-Scale Error
Negative full-scale error is the error in the DAC output voltage when 0x0000 (straight binary coding) or 0x8000 (twos complement coding) is loaded to the DAC register. Ideally, the output voltage should be negative full-scale − 1 LSB. A plot of zero-scale error vs. temperature can be seen in Figure 30.

Zero-Scale Temperature Coefficient (TC)
Zero-scale TC is a measure of the change in zero-scale error with a change in temperature. Zero-scale error TC is expressed in ppm FSR/°C.

Output Voltage Settling Time
Output voltage settling time is the amount of time it takes for the output to settle to a specified level for a full-scale input change.

Slew Rate
The slew rate of a device is a limitation in the rate of change of the output voltage. The output slewing speed of a voltage-output DAC is usually limited by the slew rate of the amplifier used at its output. Slew rate is measured from 10% to 90% of the output signal and is expressed in V/µs.

Gain Error
Gain error is a measure of the span error of the DAC. It is the deviation in slope of the DAC transfer characteristic from the ideal expressed in % FSR. A plot of gain error vs. temperature can be seen in Figure 29.

Gain Error Temperature Coefficient (TC)
Gain error TC is a measure of the change in gain error with changes in temperature. Gain error TC is expressed in ppm FSR/°C.

Total Unadjusted Error (TUE)
TUE is a measure of the output error taking all the various errors into account, namely INL error, offset error, gain error, and output drift over supplies, temperature, and time. TUE is expressed in % FSR.

Current Loop Voltage Compliance
The maximum voltage at the I_{OUT} pin for which the output current is equal to the programmed value.

Power-On Glitch Energy
Power-on glitch energy is the impulse injected into the analog output when the AD5412/AD5422 is powered on. It is specified as the area of the glitch in nV-sec. See Figure 43 and Figure 60.

Digital-to-Analog Glitch Impulse
Digital-to-analog glitch impulse is the impulse injected into the analog output when the input code in the DAC register changes state, but the output voltage remains constant. It is normally specified as the area of the glitch in nV-sec and is measured when the digital input code is changed by 1 LSB at the major carry transition (0x7FFF to 0x8000). See Figure 40 and Figure 63.

Glitch Impulse Peak Amplitude
Glitch impulse peak amplitude is the peak amplitude of the impulse injected into the analog output when the input code in the DAC register changes state. It is specified as the amplitude of the glitch in millivolt and is measured when the digital input code is changed by 1 LSB at the major carry transition (0x7FFF to 0x8000). See Figure 40 and Figure 63.

Digital Feedthrough
Digital feedthrough is a measure of the impulse injected into the analog output of the DAC from the digital inputs of the DAC but is measured when the DAC output is not updated. It is specified in nV-sec and measured with a full-scale code change on the data bus.

Power Supply Rejection Ratio (PSRR)
PSRR indicates how the output of the DAC is affected by changes in the power supply voltage.

Voltage Reference TC
Voltage reference TC is a measure of the change in the reference output voltage with a change in temperature. The reference TC is calculated using the box method, which defines the TC as the maximum change in the reference output over a given temperature range expressed in ppm/°C, as follows:

$$TC = \left[\frac{V_{REFmax} - V_{REFmin}}{V_{REFnom} \times TempRange} \right] \times 10^6$$

where:
V_{REFmax} is the maximum reference output measured over the total temperature range.
V_{REFmin} is the minimum reference output measured over the total temperature range.
V_{REFnom} is the nominal reference output voltage, 5 V.
TempRange is the specified temperature range, −40°C to +105°C.

Load Regulation
Load regulation is the change in reference output voltage due to a specified change in load current. It is expressed in ppm/mA.

THEORY OF OPERATION

The AD5412/AD5422 are precision digital-to-current loop and voltage output converters designed to meet the requirements of industrial process control applications. They provide a high precision, fully integrated, low cost single-chip solution for generating current loop and unipolar/bipolar voltage outputs. Current ranges are 0 mA to 20 mA, 0 mA to 24 mA, and 4 mA to 20 mA; the voltage ranges available are 0 V to 5 V, ±5 V, 0 V to 10 V, and ±10 V; a 10% overrange is available on all voltage output ranges. The current and voltage outputs are available on separate pins, and only one is active at any time. The desired output configuration is user selectable via the control register.

ARCHITECTURE

The DAC core architecture of the AD5412/AD5422 consists of two matched DAC sections. A simplified circuit diagram is shown in Figure 65. The four MSBs of the 12-/16-bit data-word are decoded to drive 15 switches, E1 to E15. Each of these switches connects one of 15 matched resistors to either ground or the reference buffer output. The remaining 8/12 bits of the data-word drive the S0 to S7/S11 switches of an 8-/12-bit voltage mode R-2R ladder network.

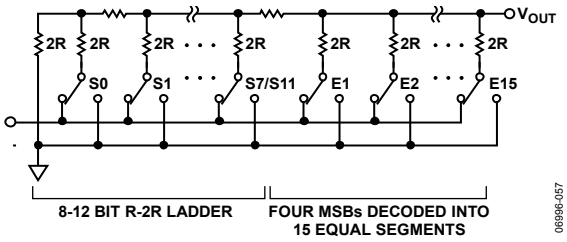

Figure 65. DAC Ladder Structure

The voltage output from the DAC core is either converted to a current (see Figure 66) which is then mirrored to the supply rail so that the application simply sees a current source output with respect to ground or it is buffered and scaled to output a software selectable unipolar or bipolar voltage range (see Figure 67). The current and voltage are output on separate pins and cannot be output simultaneously.

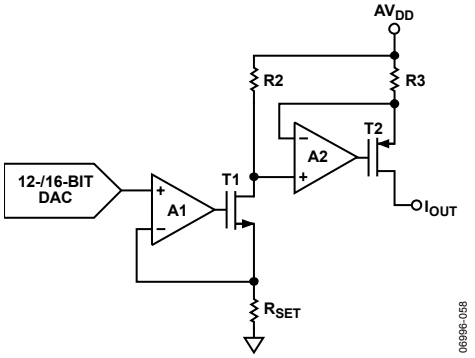

Figure 66. Voltage-to-Current Conversion Circuitry

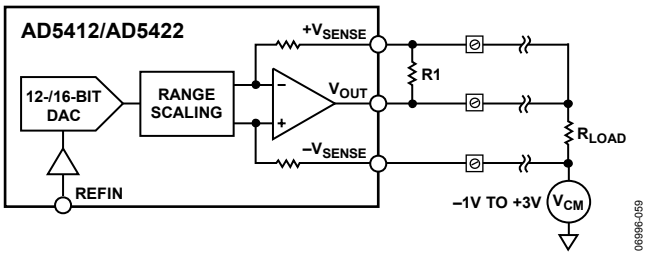

Figure 67. Voltage Output

Voltage Output Amplifier

The voltage output amplifier is capable of generating both unipolar and bipolar output voltages. It is capable of driving a load of 1 kΩ in parallel with 1 µF (with an external compensation capacitor) to GND. The source and sink capabilities of the output amplifier can be seen in Figure 37. The slew rate is 1 V/µs with a full-scale settling time of 25 µs maximum (10 V step). Figure 67 shows the voltage output driving a load, R_{LOAD}, on top of a common-mode voltage (V_{CM}) of −1 V to +3 V. In output module applications where a cable could possibly become disconnected from $+V_{SENSE}$, resulting in the amplifier loop being broken and possibly resulting in large destructive voltages on V_{OUT}, include an optional resistor (R1) between $+V_{SENSE}$ and V_{OUT}, as shown in Figure 67, of a value between 2 kΩ and 5 kΩ to ensure the amplifier loop is kept closed. If remote sensing of the load is not required, connect $+V_{SENSE}$ directly to V_{OUT} and connect $-V_{SENSE}$ directly to GND. When changing ranges on the voltage output, a glitch may occur. For this reason, it is recommended that the output be disabled by setting the OUTEN bit of the control register to logic low before changing the output voltage range; this prevents a glitch from occurring.

Driving Large Capacitive Loads

The voltage output amplifier is capable of driving capacitive loads of up to 1 µF with the addition of a nonpolarized 4 nF compensation capacitor between the C_{COMP} and V_{OUT} pins. Without the compensation capacitor, up to 20 nF capacitive loads can be driven.

SERIAL INTERFACE

The AD5412/AD5422 are controlled over a versatile 3-wire serial interface that operates at clock rates of up to 30 MHz. It is compatible with SPI, QSPI™, MICROWIRE, and DSP standards.

Input Shift Register

The input shift register is 24 bits wide. Data is loaded into the device MSB first as a 24-bit word under the control of a serial clock input, SCLK. Data is clocked in on the rising edge of SCLK. The input register consists of eight address bits and 16 data bits, as shown in Table 8. The 24-bit word is unconditionally latched on the rising edge of the LATCH pin. Data continues to be clocked in irrespective of the state of LATCH. On the rising edge of LATCH, the data that is present in the input register is latched; in other words, the last 24 bits to be clocked in before the rising edge of LATCH is the data that is latched. The timing diagram for this operation is shown in Figure 2.

Table 8. Input Shift Register Format

MSB	LSB
D23 to D16	**D15 to D0**
Address byte	Data-word

Table 9. Address Byte Functions

Address Word	Function
00000000	No operation (NOP)
00000001	Data register
00000010	Readback register value as per read address (see Table 10)
01010101	Control register
01010110	Reset register

Standalone Operation

The serial interface works with both a continuous and non-continuous serial clock. A continuous SCLK source can be used only if LATCH is taken high after the correct number of data bits have been clocked in. In gated clock mode, a burst clock containing the exact number of clock cycles must be used, and LATCH must be taken high after the final clock to latch the data. The rising edge of SCLK that clocks in the MSB of the data-word marks the beginning of the write cycle. Exactly 24 rising clock edges must be applied to SCLK before LATCH is brought high. If LATCH is brought high before the 24th rising SCLK edge, the data written is invalid. If more than 24 rising SCLK edges are applied before LATCH is brought high, the input data is also invalid.

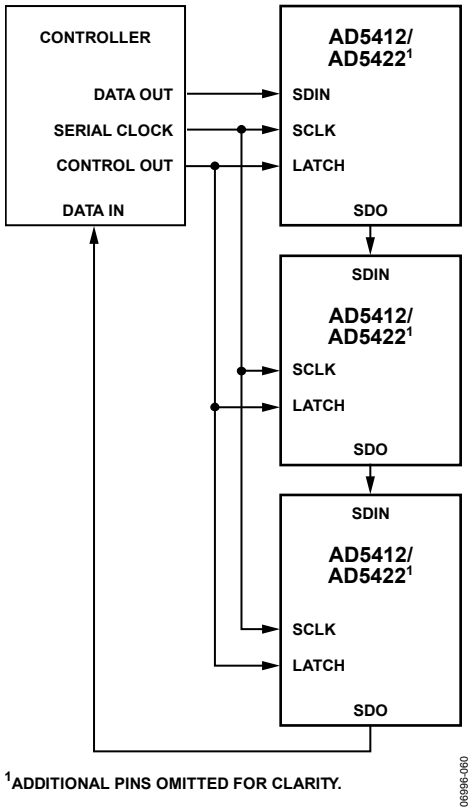

Figure 68. Daisy Chaining the AD5412/AD5422

Daisy-Chain Operation

For systems that contain several devices, the SDO pin can be used to daisy-chain the devices together as shown in Figure 68. This daisy-chain mode can be useful in system diagnostics and in reducing the number of serial interface lines. Daisy-chain mode is enabled by setting the DCEN bit of the control register to 1. The first rising edge of SCLK that clocks in the MSB of the data-word marks the beginning of the write cycle. SCLK is continuously applied to the input shift register. If more than 24 clock pulses are applied, the data ripples out of the shift register and appears on the SDO line. This data is valid on the rising edge of SCLK, having been clocked out on the previous falling SCLK edge. By connecting the SDO of the first device to the SDIN input of the next device in the chain, a multidevice interface is constructed. Each device in the system requires 24 clock pulses. Therefore, the total number of clock cycles must equal 24 × n, where n is the total number of AD5412/AD5422 devices in the chain. When the serial transfer to all devices is complete, LATCH is taken high. This latches the input data in each device in the daisy chain. The serial clock can be a continuous or a gated clock.

A continuous SCLK source can be used only if LATCH is taken high after the correct number of clock cycles. In gated clock mode, a burst clock containing the exact number of clock cycles must be used, and LATCH must be taken high after the final clock to latch the data (see Figure 4 for a timing diagram).

Readback Operation

Readback mode is invoked by setting the address byte and read address when writing to the input register (see Table 10 and Table 12). The next write to the AD5412/AD5422 should be a NOP command, which clocks out the data from the previously addressed register as shown in Figure 3.

By default the SDO pin is disabled after having addressed the AD5412/AD5422 for a read operation; a rising edge on LATCH enables the SDO pin in anticipation of data being clocked out. After the data has been clocked out on SDO, a rising edge on LATCH disables (tristate) the SDO pin. To read back the data register, for example, implement the following sequence:

1. Write 0x020001 to the input register. This configures the part for read mode with the data register selected.
2. Follow this with a second write: a NOP condition, which is 0x000000. During this write, the data from the register is clocked out on the SDO line.

Table 10. Read Address Decoding

Read Address	Function
00	Read status register
01	Read data register
10	Read control register

POWER-ON STATE

During power-on of the AD5412/AD5422, the power-on-reset circuit ensures that all registers are loaded with zero-code. As such, both outputs are disabled; that is, the V_{OUT} and I_{OUT} pins are in tristate. The $+V_{SENSE}$ pin is internally connected to ground through a 30 kΩ resistor. Therefore, if the V_{OUT} and $+V_{SENSE}$ pins are connected together, V_{OUT} is effectively clamped to ground through a 30 kΩ resistor. Also upon power-on, internal calibration registers are read, and the data is applied to internal calibration circuitry. For a reliable read operation, there must be sufficient voltage on the AV_{DD} supply when the read event is triggered by the DV_{CC} power supply powering up. Powering up the DV_{CC} supply after the AV_{DD} supply has reached at least 5 V ensures this. If DV_{CC} and AV_{DD} are powered up simultaneously, then the supplies should be powered up at a rate greater than, typically, 5000 V/sec. If the internal DV_{CC} is enabled, the supplies should be powered up at a rate greater than, typically, 2000 V/sec. If this cannot be achieved, issue a reset command to the AD5412/AD5422 after power-on; this performs a power-on-reset event, reading the calibration registers and ensures specified operation of the AD5412/AD5422. To ensure correct calibration and to allow the internal reference to settle to its correct trim value, 40 µs should be allowed after a successful power on reset.

Voltage Output

For a unipolar voltage output range, the output voltage can be expressed as

$$V_{OUT} = V_{REFIN} \times Gain\left[\frac{D}{2^N}\right]$$

For a bipolar voltage output range, the output voltage can be expressed as

$$V_{OUT} = V_{REFIN} \times Gain\left[\frac{D}{2^N}\right] - \frac{Gain \times V_{REFIN}}{2}$$

where:
D is the decimal equivalent of the code loaded to the DAC.
N is the bit resolution of the DAC.
V_{REFIN} is the reference voltage applied at the REFIN pin.
Gain is an internal gain whose value depends on the output range selected by the user as shown in Table 11.

Table 11. Internal Gain Value

Output Range	Gain Value
+5 V	1
+10 V	2
±5 V	2
±10 V	4

Current Output

For the 0 mA to 20 mA, 0 mA to 24 mA, and 4 mA to 20 mA current output ranges, the output current is respectively expressed as

$$I_{OUT} = \left[\frac{20\text{ mA}}{2^N}\right] \times D$$

$$I_{OUT} = \left[\frac{24\text{ mA}}{2^N}\right] \times D$$

$$I_{OUT} = \left[\frac{16\text{ mA}}{2^N}\right] \times D + 4\text{ mA}$$

where:
D is the decimal equivalent of the code loaded to the DAC.
N is the bit resolution of the DAC.

16-bit data-word															

CONTROL REGISTER

The control register is addressed by setting the address word of the input shift register to 0x55. The data to be written to the control register is entered in the D15 to D0 positions, as shown in Table 15. The control register functions are shown in Table 16.

Table 15. Programming the Control Register

MSB															LSB
D15	**D14**	**D13**	**D12**	**D11**	**D10**	**D9**	**D8**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**
CLRSEL	OVRRNG	REXT	OUTEN	SR clock				SR step			SREN	DCEN	R2	R1	R0

Table 16. Control Register Functions

Option	Description
CLRSEL	See Table 22 for a description of the CLRSEL operation.
OVRRNG	Setting this bit increases the voltage output range by 10% (see the AD5412/AD5422 Features section).
REXT	Setting this bit selects the external current setting resistor (see the AD5412/AD5422 Features section). When using an external current setting resistor, it is recommended to only set REXT when also setting the OUTEN bit. Alternately, REXT can be set before the OUTEN bit is set, but the range (see Table 17) must be changed on the write in which the output is enabled. See Figure 69 for best practice.
OUTEN	Output enable. This bit must be set to enable the outputs. The range bits select which output is functional.
SR clock	Digital slew rate control (see the AD5412/AD5422 Features section).
SR step	Digital slew rate control (see the AD5412/AD5422 Features section).
SREN	Digital slew rate control enable.
DCEN	Daisy chain enable.
R2, R1, R0	Output range select (see Table 17).

Table 17. Output Range Options

R2	R1	R0	Output Range Selected
0	0	0	0 V to 5 V voltage range
0	0	1	0 V to 10 V voltage range
0	1	0	±5 V voltage range
0	1	1	±10 V voltage range
1	0	1	4 mA to 20 mA current range
1	1	0	0 mA to 20 mA current range
1	1	1	0 mA to 24 mA current range

RESET REGISTER

The reset register is addressed by setting the address word of the input shift register to 0x56. The data to be written to the reset register is entered in the D0 position as shown in Table 18. The reset register options are shown in Table 18 and Table 19.

Table 18. Programming the Reset Register

MSB															LSB

Reserved															Reset

Table 19. Reset Register Functions

Option	Description
Reset	Setting this bit performs a reset operation, restoring the AD5412/AD5422 to its power-on state.

STATUS REGISTER

The status register is a read-only register. The status register functionality is shown in Table 20 and Table 21.

Table 20. Decoding the Status Register

MSB															LSB
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Reserved													I_{OUT} fault	Slew active	Over temp

Table 21. Status Register Functions

Option	Description
I_{OUT} Fault	This bit is set if a fault is detected on the I_{OUT} pin.
Slew Active	This bit is set while the output value is slewing (slew rate control enabled).
Over Temp	This bit is set if the AD5412/AD5422 core temperature exceeds ~150°C.

AD5412/AD5422 FEATURES

FAULT ALERT

The AD5412/AD5422 are equipped with a $\overline{\text{FAULT}}$ pin, which is an open-drain output allowing several AD5412/AD5422 devices to be connected together to one pull-up resistor for global fault detection. The $\overline{\text{FAULT}}$ pin is forced active by one of the following fault scenarios:

- The voltage at I_{OUT} attempts to rise above the compliance range, due to an open-loop circuit or insufficient power supply voltage. The I_{OUT} current is controlled by a PMOS transistor and internal amplifier, as shown in Figure 66. The internal circuitry that develops the fault output avoids using a comparator with window limits because this would require an actual output error before the $\overline{\text{FAULT}}$ output becomes active. Instead, the signal is generated when the internal amplifier in the output stage has less than ~1 V of remaining drive capability (when the gate of the output PMOS transistor nearly reaches ground). Thus, the $\overline{\text{FAULT}}$ output activates slightly before the compliance limit is reached. Because the comparison is made within the feedback loop of the output amplifier, the output accuracy is maintained by its open-loop gain, and an output error does not occur before the $\overline{\text{FAULT}}$ output becomes active.
- If the core temperature of the AD5412/AD5422 exceeds approximately 150°C.

The I_{OUT} fault and over temp bits of the status register are used in conjunction with the $\overline{\text{FAULT}}$ pin to inform the user which one of the fault conditions caused the $\overline{\text{FAULT}}$ pin to be asserted (see Table 20 and Table 21).

VOLTAGE OUTPUT SHORT CIRCUIT PROTECTION

Under normal operation, the voltage output sinks/sources 10 mA. The maximum current that the voltage output delivers is ~20 mA; this is the short-circuit current.

VOLTAGE OUTPUT OVERRANGE

An overrange facility is provided on the voltage output. When enabled via the control register, the selected output range is overranged by, typically, 10%.

VOLTAGE OUTPUT FORCE-SENSE

The $+V_{SENSE}$ and $-V_{SENSE}$ pins are provided to facilitate remote sensing of the load connected to the voltage output. If the load is connected at the end of a long or high impedance cable, sensing the voltage at the load allows the output amplifier to compensate and ensure that the correct voltage is applied across the load. This function is limited only by the available power supply headroom.

ASYNCHRONOUS CLEAR (CLEAR)

The CLEAR pin is an active high clear that allows the voltage output to be cleared to either zero-scale code or midscale code, user selectable via the CLEAR SELECT pin, or the CLRSEL bit of the control register, as described in Table 22. (The clear select feature is a logical OR function of the CLEAR SELECT pin and the CLRSEL bit.) The current output clears to the bottom of its programmed range. It is necessary for CLEAR to be high for a minimum amount of time to complete the operation (see Figure 2). When the CLEAR signal is returned low, the output remains at the cleared value. The preclear value can be restored by pulsing the LATCH signal low without clocking any data. A new value cannot be programmed until the CLEAR pin is returned low.

Table 22. CLRSEL Options

	Output Value	
CLRSEL	**Unipolar Output Range**	**Bipolar Output Range**
0	0 V	0 V
1	Midscale	Zero scale

In addition to defining the output value for a clear operation, the CLRSEL bit and CLEAR SELECT pin also define the default output value. During selection of a new voltage range, the output value is as defined in Table 22. To avoid glitches on the output, it is recommended that, before changing voltage ranges, the user disable the output by setting the OUTEN bit of the control register to logic low. When OUTEN is set to logic high, the output goes to the default value as defined by CLRSEL and CLEAR SELECT.

INTERNAL REFERENCE

The AD5412/AD5422 contain an integrated 5 V voltage reference with initial accuracy of ±5 mV maximum and a temperature drift coefficient of ±10 ppm/°C maximum. The reference voltage is buffered and externally available for use elsewhere within the system. See Figure 16 for a load regulation graph of the integrated reference.

EXTERNAL CURRENT SETTING RESISTOR

R_{SET} is an internal sense resistor as part of the voltage-to-current conversion circuitry (see Figure 66). The stability of the output current over temperature is dependent on the stability of the value of R_{SET}. As a method of improving the stability of the output current over temperature, an external precision 15 kΩ low drift resistor can be connected to the R_{SET} pin of the AD5412/AD5422 to be used instead of the internal resistor (R_{SET}). The external resistor is selected via the control register (see Table 15).

DIGITAL POWER SUPPLY

By default, the DV_{CC} pin accepts a power supply of 2.7 V to 5.5 V. Alternatively, via the DV_{CC} SELECT pin, an internal 4.5 V power supply can be output on the DV_{CC} pin for use as a digital power supply for other devices in the system or as a termination for pull-up resistors. This facility offers the advantage of not having to bring a digital supply across an isolation barrier. The internal power supply is enabled by leaving the DV_{CC} SELECT pin unconnected. To disable the internal supply, tie DV_{CC} SELECT to 0 V. DV_{CC} is capable of supplying up to 5 mA of current (for a load regulation graph, see Figure 10).

EXTERNAL BOOST FUNCTION

The addition of an external boost transistor, as shown in Figure 70, reduces the power dissipated in the AD5412/AD5422 by reducing the current flowing in the on-chip output transistor (dividing it by the current gain of the external circuit). A discrete NPN transistor with a breakdown voltage, BV_{CEO}, greater than 40 V can be used. The external boost capability has been developed for users who may wish to use the AD5412/AD5422 at the extremes of the supply voltage, load current, and temperature range. The boost transistor can also be used to reduce the amount of temperature-induced drift in the part. This minimizes the temperature-induced drift of the on-chip voltage reference, which improves on drift and linearity.

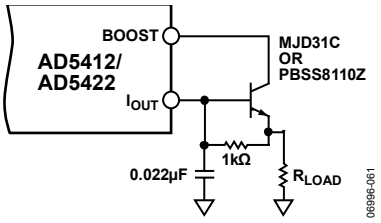

Figure 70. External Boost Configuration

EXTERNAL COMPENSATION CAPACITOR

The voltage output can ordinarily drive capacitive loads of up to 20 nF; if there is a requirement to drive greater capacitive loads, of up to 1 µF, an external compensation capacitor can be connected between the C_{COMP} and V_{OUT} pins. The addition of the capacitor keeps the output voltage stable but also reduces the bandwidth and increases the settling time of the voltage output.

HART COMMUNICATION

The AD5412/AD5422 (LFCSP version only) contain a CAP2 pin, into which a HART signal can be coupled. The HART signal appears on the current output if the output is enabled. To achieve a 1 mA peak-to-peak current, the signal amplitude at the CAP2 pin must be 48 mV peak-to-peak. Assuming that the modem output amplitude is 500 mV peak-to-peak, its output must be attenuated by 500/48 = 10.42. If this voltage is used, the current output should meet the HART amplitude specifications. Figure 71 shows the recommended circuit for attenuating and coupling in the HART signal.

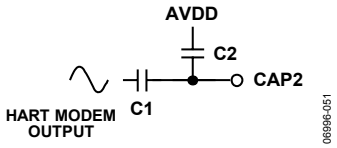

Figure 71. Coupling HART Signal

In determining the absolute values of the capacitors, ensure that the FSK output from the modem is passed undistorted. Thus, the bandwidth presented to the modem output signal must pass 1200 Hz and 2200 Hz frequencies. The recommended values are C1 = 2.2 nF and C2 = 22 nF. Digitally controlling the slew rate of the output is necessary to meet the analog rate of change requirements for HART.

DIGITAL SLEW RATE CONTROL

The slew rate control feature of the AD5412/AD5422 allows the user to control the rate at which the output voltage or current changes. With the slew rate control feature disabled, the output changes at a rate limited by the output drive circuitry and the attached load. See Figure 64 for current output step and Figure 38 for voltage output step. To reduce the slew rate, enable the slew rate control feature. With the feature enabled via the SREN bit of the control register (see Table 15), the output, instead of slewing directly between two values, steps digitally at a rate defined by two parameters accessible via the control register, as shown in Table 15. The parameters are set by the SR clock and SR step bits. SR clock defines the rate at which the digital slew is updated; SR step defines by how much the output value changes at each update. Both parameters together define the rate of change of the output voltage or current. Table 23 and Table 24 outline the range of values for both the SR clock and SR step parameters. Figure 72 shows the output current changing for ramp times of 10 ms, 50 ms, and 100 ms.

Table 23. Slew Rate Step Size Options

SR Step	AD5412 Step Size (LSB)	AD5422 Step Size (LSB)
000	1/16	1
001	1/8	2
010	1/4	4
011	1/2	8
100	1	16
101	2	32
110	4	64
111	8	128

Table 24. Slew Rate Update Clock Options

SR Clock	Update Clock Frequency (Hz)
0000	257,730
0001	198,410
0010	152,440
0011	131,580
0100	115,740
0101	69,440
0110	37,590
0111	25,770
1000	20,160
1001	16,030
1010	10,290
1011	8280
1100	6900
1101	5530
1110	4240
1111	3300

The time it takes for the output to slew over a given output range can be expressed as follows:

$$Slew\ Time = \frac{Output\ Change}{Step\ Size \times Update\ Clock\ Frequency \times LSB\ Size} \quad (1)$$

where:
Slew Time is expressed in seconds.
Output Change is expressed in amps for I_{OUT} or volts for V_{OUT}.

When the slew rate control feature is enabled, all output changes change at the programmed slew rate; if the CLEAR pin is asserted, the output slews to the zero-scale value at the programmed slew rate. The output can be halted at its current value with a write to the control register. To avoid halting the output slew, the slew active bit (see Table 20) can be read to check that the slew has completed before writing to any of the AD5410/AD5420 registers. The update clock frequency for any given value is the same for all output ranges. The step size, however, varies across output ranges for a given value of step size because the LSB size is different for each output range. Table 25 shows the range of programmable slew times for a full-scale change on any of the output ranges. The values in Table 25 were obtained using Equation 1.

The digital slew rate control feature results in a staircase formation on the current output, as shown in Figure 76. This figure also shows how the staircase can be removed by connecting capacitors to the CAP1 and CAP2 pins, as described in the I_{OUT} Filtering Capacitors (LFCSP Package) section.

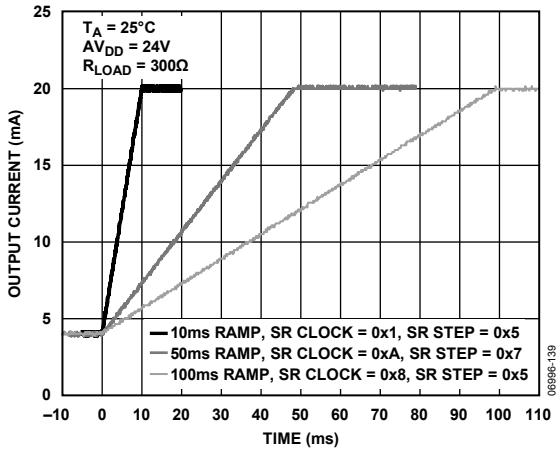

Figure 72. Output Current Slewing Under Control of the Digital Slew Rate Control Feature

I_{OUT} FILTERING CAPACITORS (LFCSP PACKAGE)

Capacitors can be placed between CAP1 and AV_{DD}, and CAP2 and AV_{DD}, as shown in Figure 73.

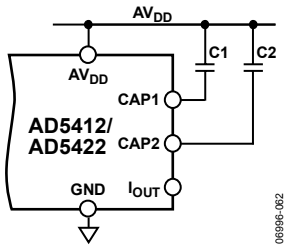

Figure 73. I_{OUT} Filtering Capacitors

The CAP1 and CAP2 pins are available only on the LFCSP package. The capacitors form a filter on the current output circuitry, as shown in Figure 74, reducing the bandwidth and the slew rate of the output current. Figure 75 shows the effect the capacitors have on the slew rate of the output current. To achieve significant reductions in the rate of change, very large capacitor values are required, which may not be suitable in some applications. In this case, the digital slew rate control feature can be used. The capacitors can be used in conjunction with the digital slew rate control feature as a means of smoothing out the steps caused by the digital code increments, as shown in Figure 76.

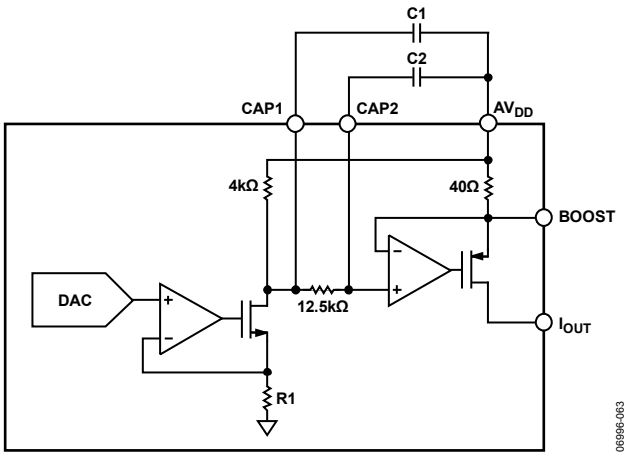

Figure 74. I_{OUT} Filter Circuitry

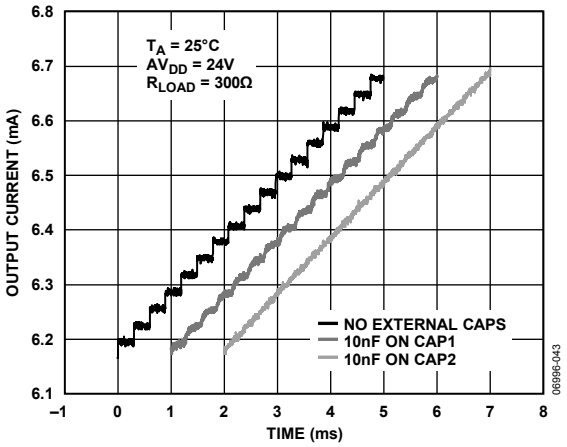

Figure 76. Smoothing Out the Steps Caused by the Digital Slew Rate Control Feature

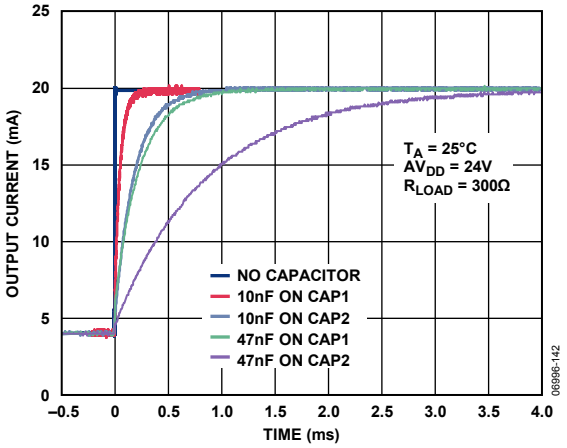

Figure 75. Slew Controlled 4 mA to 20 mA Output Current Step Using External Capacitors on the CAP1 and CAP2 Pins

APPLICATIONS INFORMATION

VOLTAGE AND CURRENT OUTPUT RANGES ON THE SAME TERMINAL

The current and voltage output pins can be connected together. A buffer amplifier is required, however, to prevent a current leakage path through an internal 30 kΩ resistor on the $+V_{SENSE}$ pin when the device is in current output mode. In current mode, the V_{OUT} pin is high impedance; whereas in voltage output mode, the I_{OUT} pin is high impedance and does not affect the voltage output. It is important that the external R_{SET} be used in this configuration, as depicted in Figure 77.

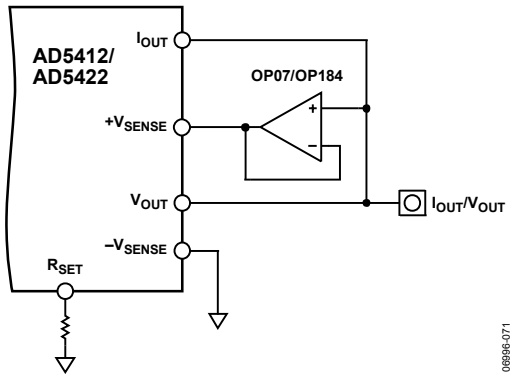

Figure 77. I_{OUT} and V_{OUT} Connected Together

DRIVING INDUCTIVE LOADS

When driving inductive or poorly defined loads, connect a 0.01 µF capacitor between I_{OUT} and GND. This ensures stability with loads above 50 mH. There is no maximum capacitance limit. The capacitive component of the load may cause slower settling. The digital slew rate control feature may also prove useful in this situation.

TRANSIENT VOLTAGE PROTECTION

The AD5412/AD5422 contain ESD protection diodes that prevent damage from normal handling. The industrial control environment can, however, subject I/O circuits to much higher transients. To protect the AD5412/AD5422 from excessively high voltage transients, external power diodes and a surge current limiting resistor are required, as shown in Figure 78. The constraint on the resistor value is that, during normal operation, the output level at I_{OUT} must remain within its voltage compliance limit of AV_{DD} – 2.5 V, and the two protection diodes and resistor must have appropriate power ratings. Further protection can be provided with transient voltage suppressors or transorbs; these are available as both unidirectional suppressors (protect against positive high voltage transients) and bidirectional suppressors (protect against both positive and negative high voltage transients) and are available in a wide range of standoff and breakdown voltage ratings. It is recommended that all field connected nodes be protected.

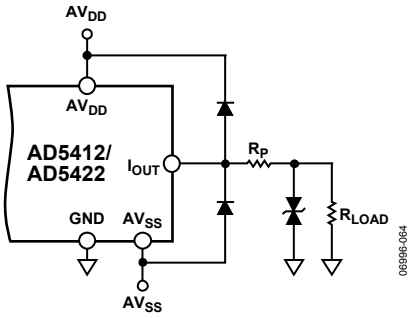

Figure 78. Output Transient Voltage Protection

GALVANICALLY ISOLATED INTERFACE

In many process control applications, it is necessary to provide an isolation barrier between the controller and the unit being controlled to protect and isolate the controlling circuitry from any hazardous common-mode voltages that may occur. The *i*Coupler® products from Analog Devices, Inc., provide voltage isolation in excess of 2.5 kV. The serial loading structure of the AD5412/AD5422 makes the parts ideal for isolated interfaces because the number of interface lines is kept to a minimum. Figure 79 shows a 4-channel isolated interface to the AD5412/AD5422 using an ADuM1400. For further information, visit www.analog.com/isolators.

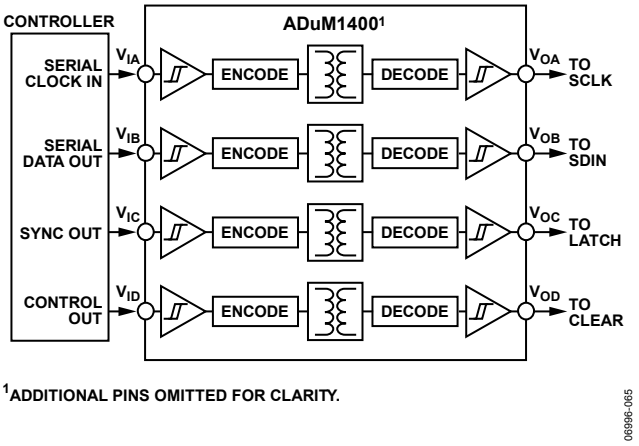

Figure 79. Isolated Interface

MICROPROCESSOR INTERFACING

Microprocessor interfacing to the AD5412/AD5422 is via a serial bus that uses a protocol compatible with microcontrollers and DSP processors. The communications channel is a 3-wire minimum interface consisting of a clock signal, a data signal, and a latch signal. The AD5412/AD5422 require a 24-bit data-word with data valid on the rising edge of SCLK.

For all interfaces, the DAC output update is initiated on the rising edge of LATCH. The contents of the registers can be read using the readback function.

LAYOUT GUIDELINES

In any circuit where accuracy is important, careful consideration of the power supply and ground return layout helps to ensure the rated performance. Design the printed circuit board (PCB) on which the AD5412/AD5422 is mounted so that the analog and digital sections are separated and confined to certain areas of the board. If the AD5412/AD5422 is in a system where multiple devices require an analog ground-to-digital ground connection, make the connection at one point only. Establish the star ground point as close as possible to the device.

The AD5412/AD5422 should have ample supply bypassing of 10 µF in parallel with 0.1 µF on each supply located as close to the package as possible, ideally right up against the device. The 10 µF capacitors are the tantalum bead type. The 0.1 µF capacitor should have low effective series resistance (ESR) and low effective series inductance (ESI), such as the common ceramic types, which provide a low impedance path to ground at high frequencies to handle transient currents due to internal logic switching.

The power supply lines of the AD5412/AD5422 should use as large a trace as possible to provide low impedance paths and reduce the effects of glitches on the power supply line. Fast switching signals such as clocks should be shielded with a digital ground to avoid radiating noise to other parts of the board. Never run these near the reference inputs. A ground line routed between the SDIN and SCLK lines helps reduce crosstalk between them (this is not required on a multilayer board that has a separate ground plane, but separating the lines helps). It is essential to minimize noise on the REFIN line because it couples through to the DAC output.

Avoid crossover of digital and analog signals. Traces on opposite sides of the PCB should run at right angles to each other. This reduces the effects of feed through the board. A microstrip technique is by far the best but not always possible with a double-sided board. In this technique, the component side of the board is dedicated to the ground plane, and signal traces are placed on the solder side.

THERMAL AND SUPPLY CONSIDERATIONS

The AD5412/AD5422 are designed to operate at a maximum junction temperature of 125°C. It is important that the devices not be operated under conditions that cause the junction temperature to exceed this value. Excessive junction temperature can occur if the AD5412/AD5422 are operated from the maximum AV_{DD} while driving the maximum current (24 mA) directly to ground. In this case, control the ambient temperature or reduce AV_{DD}. The conditions depend on the device package.

At the ambient temperature of 85°C, the 24-lead TSSOP package can dissipate 1.14 mW, and the 40-lead LFCSP package can dissipate 1.21 W.

To ensure that the junction temperature does not exceed 125°C while driving the maximum current of 24 mA directly into ground (also adding an on-chip current of 3 mA), reduce AV_{DD} from the maximum rating to ensure that the package is not required to dissipate more power than previously stated (see Table 26, Figure 80, and Figure 81).

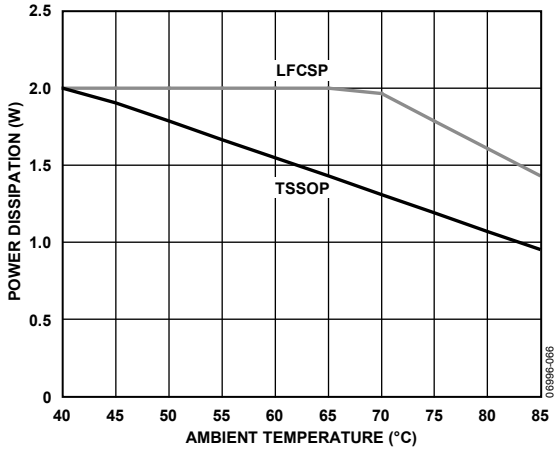

Figure 80. Maximum Power Dissipation vs. Ambient Temperature

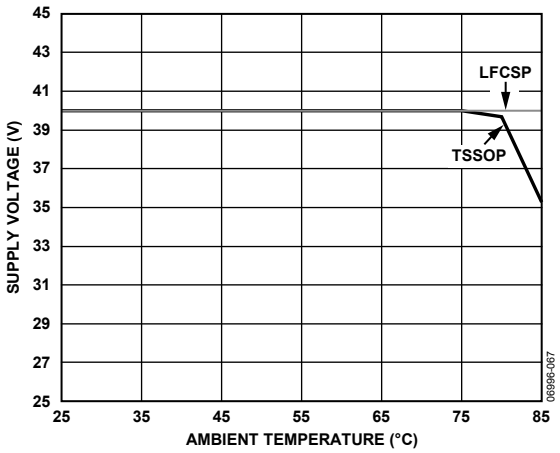

Figure 81. Maximum Supply Voltage vs. Ambient Temperature

Table 26. Thermal and Supply Considerations for Each Package

Considerations	TSSOP	LFCSP
Maximum Allowed Power Dissipation When Operating at an Ambient Temperature of 85°C	$\frac{T_J\ max - T_A}{\theta_{JA}} = \frac{125-85}{35} = 1.14\ \text{W}$	$\frac{T_J\ max - T_A}{\theta_{JA}} = \frac{125-85}{33} = 1.21\ \text{W}$
Maximum Allowed Ambient Temperature When Operating from a Supply of 40 V and Driving 24 mA Directly to Ground	$T_J\ max - P_D \times \theta_{JA} =$ $125 - (40 \times 0.028) \times 35 = 86°\text{C}$	$T_J\ max - P_D \times \theta_{JA} =$ $125 - (40 \times 0.028) \times 33 = 88°\text{C}$
Maximum Allowed Supply Voltage When Operating at an Ambient Temperature of 85°C and Driving 24 mA Directly to Ground	$\frac{T_J\ max - T_A}{AI_{DD} \times \theta_{JA}} = \frac{125-85}{0.028 \times 35} = 40\ \text{V}$	$\frac{T_J\ max - T_A}{AI_{DD} \times \theta_{JA}} = \frac{125-85}{0.028 \times 33} = 43\ \text{V}$

INDUSTRIAL ANALOG OUTPUT MODULE

Many industrial control applications have requirements for accurately controlled current and voltage output signals. The AD5412/AD5422 are ideal for such applications. Figure 83 shows the AD5412/AD5422 in a circuit design for an output module, specifically for use in an industrial control application. The design provides for a current or voltage output. The module is powered from a field supply of 24 V. This supplies AV_{DD} directly. An inverting buck regulator generates the negative supply for AV_{SS}. For transient overvoltage protection, transient voltage suppressors (TVS) are placed on all field accessible connections. A 24 V volt TVS is placed on each I_{OUT}, V_{OUT}, $+V_{SENSE}$, and $-V_{SENSE}$ connection, and a 36 V TVS is placed on the field supply input. For added protection, clamping diodes are connected from the I_{OUT}, V_{OUT}, $+V_{SENSE}$, and $-V_{SENSE}$ pins to the AV_{DD} and AV_{SS} power supply pins. If remote voltage load sensing is not required, the $+V_{SENSE}$ pin can be directly connected to the V_{OUT} pin and the $-V_{SENSE}$ pin can be connected to GND.

Isolation between the AD5412/AD5422 and the backplane circuitry is provided with ADuM1400 and ADuM1200 *i*Coupler digital isolators; further information on *i*Coupler products is available at www.analog.com/isolators. The internally generated digital power supply of the AD5412/AD5422 powers the field side of the digital isolaters, removing the need to generate a digital power supply on the field side of the isolation barrier. The AD5412/AD5422 digital supply output supplies up to 5 mA, which is more than enough to supply the 2.8 mA requirements of the ADuM1400 and ADuM1200 operating at a logic signal frequency of up to 1 MHz. To reduce the number of isolators required, nonessential signals such as CLEAR can be connected to GND. $\overline{\text{FAULT}}$ and SDO can be left unconnected, reducing the isolation requirements to just three signals. See Circuit Note CN0321 for an example of a built and tested circuit of a fully isolated, single channel voltage and 4 mA to 20 mA output with HART.

INDUSTRIAL HART CAPABLE ANALOG OUTPUT APPLICATION

Many industrial control applications have requirements for accurately controlled current output signals, and the AD5412/AD5422 are ideal for such applications. Figure 82 shows the AD5412/AD5422 in a circuit design for a HART-enabled output module, specifically for use in an industrial control application in which both the voltage output and current output are available—one at a time—on one pin, thus reducing the number of screw connections required. There is no conflict with tying the two output pins together because only the voltage output or the current output can be enabled at any one time. For further information on this circuit, see Circuit Note CN0278, *Complete 4 mA to 20 mA HART Solution with Additional Voltage Output Capability*.

The design provides for a HART-enabled current output, with the HART capability provided by the AD5700/AD5700-1 HART modem, the industry's lowest power and smallest footprint HART-compliant IC modem. For additional space-savings, the AD5700-1 offers a 0.5% precision internal oscillator. The HART_OUT signal from the AD5700 is attenuated and ac-coupled into the RSET pin of the AD5412/AD5422. Because the RSET pin is used to couple the HART signal into the AD5412/AD5422, either the TSSOP or LFCSP package option can be used for this configuration. It should be noted however, that since the TSSOP package does not have a CAP1 pin, C1 (see Figure 82) cannot be inserted in this case. While the TSSOP equivalent circuit (as in Figure 82 but without C1 in place) still passes the HART Communication Foundation physical layer specs, the results with C1 in place are superior to those without C1 in place. Further information on an alternative configuration, whereby the HART signal is coupled into the CAP2 pin can be found in Application Note AN-1065. This is based on the AD5410/AD5420 but can also be applied to the AD5412/AD5422. Use of either configuration results in the AD5700 HART modem output modulating the 4 mA to 20 mA analog current without affecting the dc level of the current. This circuit adheres to the HART physical layer specifications as defined by the HART Communication Foundation.

The module is powered from a field supply of ±10.8 V to ±26.4 V. This supplies AV_{DD}/AVSS directly. For transient overvoltage protection, transient voltage suppressors (TVS) are placed on both the I_{OUT} and field supply connections. A 24 V TVS is placed on the I_{OUT} connection, and a 36 V TVS is placed on the field supply input(s). For added protection, clamping diodes are connected from the I_{OUT} pin to the AV_{DD} and GND power supply pins. A 10 kΩ current limiting resistor is also placed in series with the positive terminal of the $+V_{SENSE}$ buffer input. This is to limit the current to an acceptable level during a transient event.
