

**THE DATASHEET OF  
LT6004IMS8#PBF**

## FEATURES

- **Wide Supply Range: 1.6V to 16V**
- **Low Supply Current: 1 $\mu$ A/Amplifier Max**
- **Low Input Bias Current: 90pA Max**
- Low Input Offset Voltage: 500 $\mu$ V Max
- Low Input Offset Voltage Drift: 2 $\mu$ V/°C
- CMRR: 100dB
- PSRR: 95dB
- $A_{VOL}$  Driving 20k $\Omega$  Load: 100,000 Min
- Capacitive Load Handling: 500pF
- Specified from -40°C to 125°C
- Available in Tiny 2mm  $\times$  2mm DFN and Low Profile (1mm) ThinSOT™ Packages

## APPLICATIONS

- Portable Gas Monitors
- Battery- or Solar-Powered Systems
- Low Voltage Signal Processing
- Micropower Active Filters

## DESCRIPTION

The LT®6003/LT6004/LT6005 are single/dual/quad op amps designed to maximize battery life and performance for portable applications. These amplifiers operate on supplies as low as 1.6V and are fully specified and guaranteed over temperature on 1.8V, 5V and  $\pm$ 8V supplies while only drawing 1 $\mu$ A maximum quiescent current.

The ultralow supply current and low operating voltage are combined with excellent amplifier specifications; input offset voltage of 500 $\mu$ V maximum with a typical drift of only 2 $\mu$ V/°C, input bias current of 90pA maximum, open loop gain of 100,000 and the ability to drive 500pF capacitive loads, making the LT6003/LT6004/LT6005 amplifiers ideal when excellent performance is required in battery powered applications.

The single LT6003 is available in the 5-pin TSOT-23 and tiny 2mm  $\times$  2mm DFN packages. The dual LT6004 is available in the 8-pin MSOP and 3mm  $\times$  3mm DFN packages. The quad LT6005 is available in the 16-pin SSOP and 5mm  $\times$  3mm DFN packages. These devices are specified over the commercial, industrial and automotive temperature ranges.

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks of Linear Technology Corporation. ThinSOT is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

**Start-Up Characteristics**  
 Supply Current vs Supply Voltage

# LT6003/LT6004/LT6005

## ABSOLUTE MAXIMUM RATINGS (Note 1)

Total Supply Voltage ( $V^+$ to $V^-$ ).....	18V	Specified Temperature Range (Note 4)	
Differential Input Voltage.....	18V	LT6003C, LT6004C, LT6005C.....	0°C to 70°C
Input Voltage Below $V^-$ .....	9V	LT6003I, LT6004I, LT6005I.....	-40°C to 85°C
Input Current.....	10mA	LT6003H, LT6004H, LT6005H.....	-40°C to 125°C
Output Short Circuit Duration (Note 2).....	Indefinite	Junction Temperature	
Operating Temperature Range (Note 3)		DFN Packages.....	125°C
LT6003C, LT6004C, LT6005C.....	-40°C to 85°C	All Other Packages.....	150°C
LT6003I, LT6004I, LT6005I.....	-40°C to 85°C	Storage Temperature Range	
LT6003H, LT6004H, LT6005H.....	-40°C to 125°C	DFN Packages.....	-65°C to 125°C
		All Other Packages.....	-65°C to 150°C
		Lead Temperature (Soldering, 10 sec)	
		TSOT, MSOP, SSOP Packages.....	300°C

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** A heat sink may be required to keep the junction temperature below absolute maximum. This depends on the power supply voltage and how many amplifiers are shorted. The  $\theta_{\text{JA}}$  specified for the DC, DD and DHC packages is with minimal PCB heat spreading metal. Using expanded metal area on all layers of a board reduces this value.

**Note 3:** The LT6003C/LT6004C/LT6005C and LT6003I/LT6004I/LT6005I are guaranteed functional over the temperature range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . The LT6003H/LT6004H/LT6005H are guaranteed functional over the operating temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

**Note 4:** The LT6003C/LT6004C/LT6005C are guaranteed to meet specified performance from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ . The LT6003I/LT6004I/LT6005I are designed, characterized and expected to meet specified performance from

$-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  but are not tested or QA sampled at these temperatures. The LT6003I/LT6004I/LT6005I are guaranteed to meet specified performance from  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . The LT6003H/LT6004H/LT6005H are guaranteed to meet specified performance from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

**Note 5:** This parameter is not 100% tested.

**Note 6:** Output voltage swings are measured between the output and power supply rails.

**Note 7:** Limits are guaranteed by correlation to  $V_S = 5\text{V}$  tests.

**Note 8:** Limits are guaranteed by correlation to  $V_S = 1.8\text{V}$  tests

**Note 9:** Limits are guaranteed by correlation to  $V_S = \pm 8\text{V}$  tests

**Note 10:** Full-power bandwidth is calculated from the slew rate:

$$\text{FPBW} = \text{SR}/\pi V_{\text{P-P}}$$

**Note 11:** Slew rate measured at  $V_S = 1.8\text{V}$ ,  $V_{\text{OUT}} = 0.4\text{V}$  to  $1.4\text{V}$  is used to guarantee by correlation the slew rate at  $V_S = 5\text{V}$ ,  $V_{\text{OUT}} = 1\text{V}$  to  $4\text{V}$  and the slew rate at  $V_S = \pm 8\text{V}$ ,  $V_{\text{OUT}} = -5\text{V}$  to  $5\text{V}$ .

## APPLICATIONS INFORMATION

### Supply Voltage

The positive supply of the LT6003/LT6004/LT6005 should be bypassed with a small capacitor (about 0.01 $\mu$ F) within an inch of the pin. When driving heavy loads, an additional 4.7 $\mu$ F electrolytic capacitor should be used. When using split supplies, the same is true for the negative supply pin.

### Rail-to-Rail Characteristics

The LT6003/LT6004/LT6005 are fully functional for an input signal range from the negative supply to the positive supply. Figure 1 shows a simplified schematic of the amplifier. The input stage consists of two differential amplifiers, a PNP stage Q3/Q6 and an NPN stage Q4/Q5 that are active over different ranges of the input common mode voltage. The PNP stage is active for common mode voltages,  $V_{CM}$ , between the negative supply to approximately 0.9V below the positive supply. As  $V_{CM}$  moves closer towards the positive supply, the transistor Q7 will steer Q2's tail current to the current mirror Q8/Q9, activating the NPN differential pair. The PNP pair becomes inactive for the rest of the input common mode voltage range up to the positive supply.

The second stage is a folded cascode and current mirror that converts the input stage differential signals into a single ended output. Capacitor C1 reduces the unity cross frequency and improves the frequency stability without degrading the gain bandwidth of the amplifier. The complementary drive generator supplies current to the output transistors that swing from rail to rail.

### Input

Input bias current ( $I_B$ ) is minimized with cancellation circuitry on both input stages. The cancellation circuitry remains active when  $V_{CM}$  is more than 300mV from either rail. As  $V_{CM}$  approaches  $V^-$  the cancellation circuitry turns off and  $I_B$  is determined by the tail current of Q2 and the

beta of the PNP input transistors. As  $V_{CM}$  approaches  $V^+$  devices in the cancellation circuitry saturate causing  $I_B$  to increase (in the nanoamp range). Input offset voltage errors due to  $I_B$  can be minimized by equalizing the noninverting and inverting source impedances.

The input offset voltage changes depending on which input stage is active; input offset voltage is trimmed on both input stages, and is guaranteed to be 500 $\mu$ V max in the PNP stage. By trimming the input offset voltage of both input stages, the input offset voltage shift over the entire common mode range (CMRR) is typically 160 $\mu$ V, maintaining the precision characteristics of the amplifier.

The input stage of the LT6003/LT6004/LT6005 incorporates phase reversal protection to prevent wrong polarity outputs from occurring when the inputs are driven up to 9V below the negative rail. 600k protective resistors are included in the input leads so that current does not become excessive when the inputs are forced below  $V^-$  or when a large differential signal is applied. Input current should be limited to 10mA when the inputs are driven above the positive rail.

### Output

The output of the LT6003/LT6004/LT6005 is guaranteed to swing within 100mV of the positive rail and 50mV of the negative rail with no load, over the industrial temperature range. The LT6003/LT6004/LT6005 can typically source 8mA on a single 5V supply. Sourcing current is reduced to 5mA on a single 1.8V supply as noted in the electrical characteristics. However, when sourcing more than 250 $\mu$ A with an output load impedance greater than 20k $\Omega$ , a 1 $\mu$ F capacitor in series with a 2k resistor should be placed from the output to ground to insure stability.

The normally reverse-biased substrate diode from the output to  $V^-$  will cause unlimited currents to flow when the output is forced below  $V^-$ . If the current is transient and limited to 100mA, no damage will occur.

## APPLICATIONS INFORMATION

### Gain

The open-loop gain is almost independent of load when the output is sourcing current. This optimizes performance in single supply applications where the load is returned to ground. The Typical Performance Characteristics curve of Open-Loop Gain for various loads shows the details.

### Start-Up and Output Saturation Characteristics

Micropower op amps are often not micropower during start-up or during output saturation. This can wreak havoc on limited current supplies. In the worst case there may not be enough supply current available to take the system up to nominal voltages. Unlike the LT6003/LT6004/LT6005, when the output saturates, some op amps may draw excessive current and pull down the supplies, compromising rail-to-rail performance. Figure 2 shows the start-up characteristics of the LT6003/LT6004/LT6005 for three limiting cases. The circuits are shown in Figure 3. One circuit creates a positive offset forcing the output to come up saturated high. Another circuit creates a negative offset forcing the output to come up saturated low, while the last circuit brings the output up at 1/2 supply. In all cases, the supply current is well controlled and is not excessive when the output is on either rail.

Figure 2. Start-Up Characteristics

Figure 3. Circuits for Start-Up Characteristics

### Adaptive Filter

The circuit of Figure 4 shows the LT6005 applied as a micropower adaptive filter, which automatically adjusts the time constant depending on the signal level. Op amp A1 buffers the input onto the RC which has either a 1ms or 20ms time constant depending on the state of switch S1. The signal is then buffered to the output by op amp A2. Op amps A3 and A4 are configured as gain-of-40 difference amplifiers, gaining up the difference between the buffered input voltage and the output. When there is no difference, the outputs of A3 and A4 will be near zero. When a positive signal step is applied to the input, the output of A3 rises. When a negative signal step is applied to the input, the output of A4 rises. These voltages are fed to the LT6700-2 comparator which has a built in 400mV reference. If the input step exceeds 10mV, the output of the difference amplifiers will exceed 400mV and the comparator output (wired in OR gate fashion) falls low. This turns on S1, reducing the time constant and speeding up the settling. The overall effect is that the circuit provides “slow filtering” with “fast settling.” Waveforms for a 100mV input step are shown in the accompanying photo. The fast 1ms time constant is obvious in the output waveform, while the slow time constant is discernible as the slow ramping sections. That the slow time constant is discernible at all is due to delay time in the difference amplifier and comparator functions.

APPLICATIONS INFORMATION

ADAPTIVE FILTER IMPROVES INHERENT TRADE-OFF OF SETTLING TIME VS NOISE FILTERING. SMALL SIGNAL DC STEPS SETTLE WITH A 20ms TIME CONSTANT FOR AN 8Hz NOISE BANDWIDTH. LARGE STEP SIGNALS (>10mV) CAUSE S1 TO TURN ON, SPEEDING UP THE TIME CONSTANT TO 1ms, FOR IMPROVED SETTLING. AS THE OUTPUT SETTLES BACK TO WITHIN 10mV, S1 TURNS OFF AGAIN, RESTORING THE 20ms TIME CONSTANT, FOR IMPROVED FILTERING.
