

**THE DATASHEET OF
NCP603SN350T1G**

NCP603

300 mA High Performance CMOS LDO Regulator with Enable and Enhanced ESD Protection

The NCP603 provides 300 mA of output current at fixed voltage options, or an adjustable output voltage from 5.0 V down to 1.250 V. It is designed for portable battery powered applications and offers high performance features such as low power operation, fast enable response time, and low dropout.

The device is designed to be used with low cost ceramic capacitors and is packaged in the TSOP-5/SOT23-5.

Features

- Output Voltage Options:
Adjustable, 1.3 V, 1.5 V, 1.8 V, 2.5 V, 2.8 V, 3.0 V, 3.3 V, 3.5 V, 5.0 V
- Adjustable Output by External Resistors from 5.0 V down to 1.250 V
- Fast Enable Turn-on Time of 15 μ s
- Wide Supply Voltage Range Operating Range
- Excellent Line and Load Regulation
- Typical Noise Voltage of 50 μ V_{rms} without a Bypass Capacitor
- Enhanced ESD Protection (HBM 3.5 kV, MM 200 V)
- These are Pb-Free Devices

Typical Applications

- SMPS Post-Regulation
- Hand-held Instrumentation & Audio Players
- Noise Sensitive Circuits – VCO, RF Stages, etc.
- Camcorders and Cameras
- Portable Computing

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 12 of this data sheet.

NCP603

PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	V_{in}	Positive Power Supply Input
2	GND	Power Supply Ground; Device Substrate
3	ENABLE	The Enable Input places the device into low-power standby when pulled to logic low (< 0.4 V). Connect to V_{in} if the function is not used.
4	ADJ/NC	Output Voltage Adjust Input (Adjustable Version), No Connection (Fixed Voltage Versions) (Note 1)
5	V_{out}	Regulated Output Voltage

1. True no connect. Printed circuit board traces are allowable.

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 2)	V_{in}	-0.3 to 6.5	V
Output, Enable, Adjustable Voltage	V_{out} , ENABLE, ADJ	-0.3 to 6.5 (or $V_{in} + 0.3$) Whichever is Lower	V
Maximum Junction Temperature	$T_{J(max)}$	150	°C
Storage Temperature	T_{STG}	-65 to 150	°C
ESD Capability, Human Body Model (Note 3)	ESD _{HBM}	3500	V
ESD Capability, Machine Model (Note 3)	ESD _{MM}	200	V
Moisture Sensitivity Level	MSL	MSL1/260	-

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

2. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

3. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)

Latchup Current Maximum Rating: ≤ 150 mA per JEDEC standard: JESD78.

THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Characteristics, TSOP-5 (Note 4) Thermal Resistance, Junction-to-Air (Note 5)	$R_{\theta JA}$	215	°C/W

4. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

5. Value based on copper area of 645 mm² (or 1 in²) of 1 oz copper thickness.

OPERATING RANGES (Note 6)

Rating	Symbol	Min	Max	Unit
Input Voltage (Note 7)	V_{in}	1.75	6	V
Adjustable Output Voltage (Adjustable Version Only)	V_{out}	1.25	5.0	V
Output Current	I_{out}	0	300	mA
Ambient Temperature	T_A	-40	125	°C

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

7. Minimum $V_{in} = 1.75$ V or ($V_{out} + V_{DO}$), whichever is higher.

DEFINITIONS

Load Regulation

The change in output voltage for a change in output load current at a constant temperature.

Dropout Voltage

The input/output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 2% below its nominal. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Output Noise Voltage

This is the integrated value of the output noise over a specified frequency range. Input voltage and output load current are kept constant during the measurement. Results are expressed in μV_{rms} or $\text{nV} \sqrt{\text{Hz}}$.

Ground Current

Ground Current is the current that flows through the ground pin when the regulator operates without a load on its output (I_{GND}). This consists of internal IC operation, bias, etc. It is actually the difference between the input current (measured through the LDO input pin) and the output load current. If the regulator has an input pin that reduces its internal bias and shuts off the output (enable/disable function), this term is called the standby current (I_{STBY}).

Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that the average junction temperature is not significantly affected.

Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between no-load and full-load conditions.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C , the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level at which the junction temperature reaches its maximum operating value.

APPLICATIONS INFORMATION

The NCP603 series regulator is self-protected with internal thermal shutdown and internal current limit. Typical application circuits are shown in Figures 2 and 3.

Input Decoupling (C_{in})

A ceramic or tantalum $1.0 \mu\text{F}$ capacitor is recommended and should be connected close to the NCP603 package. Higher capacitance and lower ESR will improve the overall line transient response.

Output Decoupling (C_{out})

The NCP603 is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The minimum output decoupling value is $1.0 \mu\text{F}$ and can be augmented to fulfill stringent load transient requirements. The regulator works with ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response. Figure 28 shows the stability region for a range of operating conditions and ESR values.

No-Load Regulation Considerations

The NCP603 adjustable regulator will operate properly under conditions where the only load current is through the resistor divider that sets the output voltage. However, in the case where the NCP603 is configured to provide a 1.250 V

output, there is no resistor divider. If the part is enabled under no-load conditions, leakage current through the pass transistor at junction temperatures above 85°C can approach several microamperes, especially as junction temperature approaches 150°C . If this leakage current is not directed into a load, the output voltage will rise up to a level approximately 20 mV above nominal.

The NCP603 contains an overshoot clamp circuit to improve transient response during a load current step release. When output voltage exceeds the nominal by approximately 20 mV , this circuit becomes active and clamps the output from further voltage increase. Tying the ENABLE pin to V_{in} will ensure that the part is active whenever the supply voltage is present, thus guaranteeing that the clamp circuit is active whenever leakage current is present.

When the NCP603 adjustable regulator is disabled, the overshoot clamp circuit becomes inactive and the pass transistor leakage will charge any capacitance on V_{out} . If no load is present, the output can charge up to within a few millivolts of V_{in} . In most applications, the load will present some impedance to V_{out} such that the output voltage will be inherently clamped at a safe level. A minimum load of $10 \mu\text{A}$ is recommended.

NCP603

Noise Decoupling

The NCP603 is a low noise regulator and needs no external noise reduction capacitor. Unlike other low noise regulators which require an external capacitor and have slow startup times, the NCP603 operates without a noise reduction capacitor, has a typical 15 μs start up delay and achieves a 50 μV_{rms} overall noise level between 10 Hz and 100 kHz.

Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. The turn-on/turn-off transient voltage being supplied to the enable pin should exceed a slew rate of 10 mV/ μs to ensure correct operation. If the enable function is not to be used then the pin should be connected to V_{in} .

Output Voltage Adjust

The output voltage can be adjusted from 1 times (Figure 2) to 4 times (Figure 3) the typical 1.250 V regulation voltage via the use of resistors between the output and the ADJ input. The output voltage and resistors are chosen using Equation 1 and Equation 2.

$$V_{\text{OUT}} = 1.250 \left(1 + \frac{R_1}{R_2} \right) + (I_{\text{ADJ}} \times R_1) \quad (\text{eq. 1})$$

$$R_1 = R_2 * \left[\frac{[V_{\text{out}} - (I_{\text{ADJ}} * R_1)]}{1.25} - 1 \right] \cong R_2 \left[\frac{V_{\text{out}}}{1.25} - 1 \right] \quad (\text{eq. 2})$$

Input bias current I_{ADJ} is typically less than 150 nA. Choose R_2 arbitrarily to minimize errors due to the bias current and to minimize noise contribution to the output voltage. Use Equation 2 to find the required value for R_1 .

Thermal

As power in the NCP603 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCP603 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCP603 can handle is given by:

$$PD(\text{MAX}) = \frac{T_{\text{J}(\text{MAX})} - T_{\text{A}}}{R_{\theta\text{JA}}} \quad (\text{eq. 3})$$

Since T_{J} is not recommended to exceed 125°C ($T_{\text{J}(\text{MAX})}$), then the NCP603 can dissipate up to 465 mW when the ambient temperature (T_{A}) is 25°C and the device is assembled on 1 oz PCB with 645 mm² area.

The power dissipated by the NCP603 can be calculated from the following equations:

$$PD \approx V_{\text{IN}}(I_{\text{GND@IOUT}}) + I_{\text{OUT}}(V_{\text{IN}} - V_{\text{OUT}}) \quad (\text{eq. 4})$$

or

$$V_{\text{IN}(\text{MAX})} \approx \frac{PD(\text{MAX}) + (V_{\text{OUT}} \times I_{\text{OUT}})}{I_{\text{OUT}} + I_{\text{GND}}} \quad (\text{eq. 5})$$

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCP603, and make traces as short as possible.
