

IRU1206/IRU1207/IRU1208/IRU1209(PbF)

1A VERY LOW DROPOUT POSITIVE FIXED AND ADJUSTABLE REGULATORS

FEATURES

- Low Dropout Voltage (500mV at 1A)
- 1% Voltage Reference Accuracy
- Low Ground Current
- 1 μ A Maximum Quiescent Current in Shutdown (IRU1207, IRU1208)
- Fast Transient Response
- Current Limit and Thermal Shutdown
- Error Flag Signal for Output out of Regulation (IRU1207, IRU1208)

APPLICATIONS

- 2.5V Supply from 3.3V Input for the new generation of Logic ICs
- Computer Mother Board, Add-On Cards
- High Efficiency Post Regulator in Switch Mode Power Supply (SMPS)

DESCRIPTION

The IRU1206 family of devices are ultra low dropout 1A regulators using PNP transistor as the pass element. These products are ideal when a single input supply is only available and the dropout voltage is less than 1V, exceeding the minimum dropout characteristics of NPN/PNP hybrid regulators. One common application of these regulators is where input is 3.3V and a 2.5V output is needed.

Besides the low dropout of less than 0.5V, other features of the family of the parts are: micro-power shutdown capability and output UVLO detection where Flag pin is switched low when output is below 5% of its nominal point.

ELECTRICAL SPECIFICATIONS

Unless otherwise specified, these specifications apply over $C_{IN}=C_{OUT}=10\mu\text{F}$, $V_{IN}=V_O+1\text{V}$, $V_{OUT}=V_{FB}$ (For adjustable version only), and $T_A=25^{\circ}\text{C}$. Typical values refer to $T_A=25^{\circ}\text{C}$. Low duty cycle pulse testing is used which keeps junction and case temperatures equal to the ambient temperature.

Note 1: Low duty cycle pulse testing with Kelvin connections is required in order to maintain accurate data.

Note 2: Dropout voltage is defined as the minimum differential voltage between V_{IN} and V_{OUT} required to maintain regulation at V_{OUT} . It is measured when the output voltage drops 1% below its nominal value.

Note 3: Ground current is the regulator quiescent current plus the pass transistor current. The total current from the supply is the sum of the load current plus the ground pin current.

Note 4: The specification applies for the junction temperature of 0 to +125°C.

PIN DESCRIPTIONS

PIN SYMBOL	PIN DESCRIPTION
V_{IN} (All devices)	The input pin of the regulator. Typically a large storage capacitor is connected from this pin to ground to insure that the input voltage does not sag below the minimum drop out voltage during the load transient response. This pin must always be 0.6V higher than V_{OUT} in order for the device to regulate properly.
V_{OUT} (All devices)	The output of the regulator. A minimum of 2.2 μF capacitor must be connected from this pin to ground.
Gnd (All devices)	Ground pin. This pin must be connected to the lowest potential in the system and all other pins must be at higher potential with respect to this pin.
Enable (IRU1207, IRU1209)	Enable pin. A low signal or left open on this pin shuts down the output. This pin must be tied HI or to V_{IN} for normal operation.
Flag (IRU1207, IRU1208)	An open collector output that switches low when the output voltage drops about 4% below its expected regulated voltage.
Adj (IRU1208, IRU1209)	A resistor divider from this pin to the V_{OUT} pin and ground sets the output voltage.

APPLICATION INFORMATION

Stability

The IRU120X series of regulators require the use of an output capacitor as part of the frequency compensation in order to make the regulator stable. A minimum of 2.2 μF capacitance and the ESR in the range of 0.5 to 2 Ω insures the stability of the system.
