MAX6006–MAX6009

1µA SOT23 Precision Shunt Voltage Reference

General Description

The MAX6006–MAX6009 ultra-low-power shunt references are ideal for space-critical and low-power applications. They are offered in 3-pin SOT23 packages, and the minimum operating current is guaranteed to be <1µA. The devices feature low temperature coefficients of <30ppm/°C and initial accuracy of better than 0.2%.

Available in +1.25V, +2.048V, +2.5V, and 3V output voltages, the MAX6006–MAX6009 have references of +1.25V, +2.048V, +2.5V, and +3.0V, respectively. The devices can be used as lower-power, higher-precision upgrades to the ICL8069, LM385, LT1004, and LM4040 references. The MAX6006–MAX6009 are available in two grades: A and B. The A grade features a temperature coefficient of 30ppm/°C over the extended temperature range of -40°C to +85°C, with an initial accuracy of 0.2%. Grade B features a temperature coefficient of 75ppm/°C with an initial accuracy of 0.5%. MAX6006 in +1.25V and MAX6008 in +2.5V are offered in 8-pin SO packages, as plug in upgrades for LT1004 and LM285.

Features

- Ultra-Low Operating Current: Guaranteed < 1µA
- Small 3-Pin SOT23 Package
- Initial Voltage Accuracy: 0.2%
- Temperature Coefficient: 30ppm/°C max
- Temperature Range: -40°C to +85°C
- Factory-Trimmed Output Voltages: +1.25V, +2.048V, +2.5V, +3.0V
- Wide Operating Range: 1µA to 2mA
- AEC-Q100 (MAX6008AEUR/V+ Only)

Applications

- Battery-Powered Equipment
- Portable Meters
- Precision Regulators
- A/D and D/A Converters

Note 1: All devices are 100% production tested at $T_A = +25^\circ\text{C}$ and are guaranteed by design for $T_A = T_{MIN}$ to T_{MAX} , as specified.

Note 2: This parameter is guaranteed by the “reverse breakdown change with current” test.

Note 3: TC is measured by the “box” method; i.e., $(V_{MAX} - V_{MIN}) / (T_{MAX} - T_{MIN})$.

Note 4: Thermal hysteresis is defined as the change in the $+25^\circ\text{C}$ output voltage after cycling the device from T_{MIN} to T_{MAX} .

Pin Description

| PIN | | NAME | FUNCTION |
|-------|---------------|------|---|
| SOT23 | SO | | |
| 1 | 6, 8 | OUT | Output Voltage. Bias OUT with a pullup resistor to a potential greater than OUT. Bypass OUT to GND with a 0.01µF or larger capacitor. |
| 2 | 4 | GND | Ground |
| 3 | — | IC | Internally connected test point. Leave this pin unconnected, or connect to GND. |
| — | 1, 2, 3, 5, 7 | N.C. | No connection. Not internally connected. |

Detailed Description

The MAX6006–MAX6009 are precision, two-terminal, series bandgap voltage references. On-chip thin-film resistors are laser trimmed to provide 0.2% output voltage accuracies. Voltages of +1.25V, +2.048V, +2.5V, and +3.0V are available in the space-saving SOT23 package (2.1mm x 2.7mm).

Applications Information

Output/Load Capacitance

For devices in this family, OUT needs to be bypassed to GND with a 0.01µF or larger capacitor. In applications where the load or the supply can experience step changes, additional capacitance will reduce the amount of overshoot (or undershoot) and assist the circuit’s transient response.

Output Voltage Hysteresis

Output voltage hysteresis is the change in the output voltage at $T_A = +25^\circ\text{C}$ before and after the device is cycled over its entire operating temperature range. Hysteresis is caused by differential package stress appearing across the bandgap core transistors. The temperature hysteresis value is typically less than 200ppm.

Turn-On Time

The output capacitance and bias current of the MAX6006–MAX6009 greatly affects turn-on settling time. In the *Typical Operating Characteristics*, turn-on time is shown with a 10nF output capacitor and a 1.2µA bias current. Under these conditions, the MAX6006–MAX6009 settle in 40ms. Settling time will linearly decrease in proportion to the circuit’s bias current.

Typical Applications

In the typical shunt regulator application shown in Figure 1, R_{BIAS} is used to set the current through the load (I_L) and the current through the shunt regulator (I_{RMIN}). There are two worst-case situations that R_{BIAS} needs to be sized for:

- 1) R_{BIAS} must be small enough that when V_S (supply voltage) is at its minimum and I_L is at its maximum, I_{RMIN} is equal to at least the minimum operating current of the shunt regulator.
- 2) R_{BIAS} must be large enough that when V_S is at its maximum and I_L is at its minimum, I_{RMIN} is $< 2\text{mA}$.
