

THE DATASHEET OF STBB3JCCR

2 A, high efficiency single inductor buck-boost DC-DC converter and high brightness WLED driver

Datasheet - production data

Applications

- HB WLED driver
- Single cell Li-Ion, two-cell and three-cell alkaline, Ni-MH powered devices
- Memory card supply
- Tablet, smartphones
- Digital cameras

Features

- 100 mV feedback signal
- Input voltage range from 1.8 V to 5.5 V
- 2 A output current at 3.3 V_{OUT} in buck mode (V_{IN}= 3.6 V to 5.5 V)
- 800 mA output current at 3.3 V_{OUT} in boost mode (V_{IN} ≥ 2.0 V)
- Typical efficiency higher than 94%
- Automatic transition between step-down and boost mode
- Adjustable output voltage from 1.2 V to 5.5 V
- Power save mode (PS) at light load
- 2.0 MHz fixed switching frequency
- Adjustable switching frequency up to 2.4 MHz (by external synchronous square signal)
- Device quiescent current less than 50 μA
- Load disconnect during shutdown
- Shutdown function and soft-start
- Shutdown current < 1 μA
- Available in Flip Chip 20, pitch = 0.4 mm

Description

The STBB3JCC is a fixed frequency, high efficiency, buck-boost DC-DC converter which provides output voltages from 1.2 V to 5.5 V starting from input voltage from 1.8 V to 5.5 V. Thanks to very low sensing voltage, only 100 mV and very low R_{DS(on)} of integrated power MOSFET, it achieves very high efficiency driving high brightness white LED in constant current mode. The device can operate with input voltages higher than, equal to, or lower than the output voltage making the product suitable for cell lithium-Ion applications where the output voltage is within the battery voltage range. The MODE pin allows the selection between auto mode and forced PWM mode, taking advantage from either lower power consumption or best dynamic performance. The device also includes soft-start control, thermal shutdown, and current limit. The STBB3JCC is packaged in Flip Chip 20 bumps with 2.5 x 1.75 mm.

3 Pin configuration

Table 3. Pin description

Pin name	Pin	Description
VOUT	A1, A2, A3	Output voltage.
SW1	D1, D2, D3	Switch pin - internal switches are connected to this pin. Connect inductor between SW1 to SW2.
PGND	C1, C2, C3	Power ground.
SW2	B1, B2, B3	Switch pin - internal switches are connected to this pin. Connect inductor between SW1 and SW2.
EN	E4	Enable pin. Connect this pin to GND or a voltage lower than 0.4 V to shut down the IC. A voltage higher than 1.2 V is required to enable the IC.
MODE/SYNC	D4	The MODE pin selects auto transition mode and fixed frequency PWM mode. If the MODE pin is low, the STBB3JCC automatically switches between pulse-skipping and standard fixed frequency PWM according to the load level. If the MODE pin is pulled high, the STBB3JCC works always at fixed frequency. MODE pin must be pulled high if the STBB3JCC is used as HB WLED driver (constant current) for best dynamic performance. When a square wave is applied, this pin provides the clock signal for oscillator synchronization.
VIN_A	C4	Supply voltage for control stage. Connecting a capacitor of minimum 100 nF between VIN_A and GND.
VIN_SW	E1, E2, E3	Power input voltage.
GND	B4	Signal ground.
FB	A4	Feedback voltage.

4 Absolute maximum ratings

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
VIN_A, VIN_SW	Supply voltage	-0.3 to 7.0	V
SW1,SW2	Switching nodes	-0.3 to 7.0	V
VOUT	Output voltage	-0.3 to 7.0	V
MODE, EN	Logic pins	-0.3 to 7.0	V
FB	Feedback pin for adjustable version	-0.3 to 1.5	V
ESD	Human body model	± 2000	V
T _{AMB}	Operating ambient temperature	-40 to 85	°C
T _J	Maximum operating junction temperature	150	°C
T _{STG}	Storage temperature	-65 to 150	°C

Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

Table 5. Thermal data

Symbol	Parameter	Value	Unit
R _{th(JA)}	Thermal resistance junction-ambient	84	°C/W

5 Electrical characteristics

$V_{IN} = V_{INA} = V_{EN} = 3.6\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $C_{IN} = 4 \times 10\ \mu\text{F}$, $C_{OUT} = 4 \times 10\ \mu\text{F}$, $C_{INA} = 100\ \text{nF}$,
 $L1 = 1.5\ \mu\text{H}$, $T_A = -40\text{ }^\circ\text{C}$ to $85\text{ }^\circ\text{C}$ (unless otherwise specified; typical values are referred to $T_A = 25\text{ }^\circ\text{C}$).

Table 6. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
General section

7 General description

The STBB3JCC is a high efficiency dual mode buck-boost switch mode converter. Thanks to the 4 internal switches, 2 P-channels and 2 N-channels, it is able to deliver a well-regulated output voltage using a variable input voltage which can be higher than, equal to, or lower than the desired output voltage. This solves most of the power supply problems that circuit designers face when dealing with battery-powered equipment.

The controller uses a peak current mode technique in order to obtain good stability in all possible conditions of input voltage, output voltage and output current. In addition, the peak inductor current is monitored to avoid saturation of the coil.

The STBB3JCC can work in two different modes: PWM mode or power save mode. Top-class line and load transients are achieved thanks to a feed-forward technique and due to the innovative control method specifically designed to optimize the performance in the buck-boost region where input voltage is very close to the output voltage. In HB WLED driver configuration, the MODE pin must be set high in full PWM mode operation.

The STBB3JCC is self-protected from overcurrent and overtemperature. Undervoltage lockout and soft-start guarantee proper operation during startup.

Input voltage and ground connections are split into power and signal pins. This allows reduction of internal disturbances when the 4 internal switches are working. The switch bridge is connected between the V_{IN} and PGND pins while all logic blocks are connected between V_{INA} and GND.

7.1 Dual mode operation

The STBB3JCC works in PWM mode or in power save mode (PS) according to the different status of the MODE pin. If the MODE pin is pulled high the device works in PWM only. In this case the device operates at 2 MHz fixed frequency pulse width modulation (PWM mode) in all line/load conditions. In this condition, the STBB3JCC provides the best dynamic performance. If the MODE pin is pulled low, at low average current the STBB3JCC enters PS mode allowing very low power consumption and therefore obtaining very good efficiency event at light load. When the average current increases, the device automatically switches to PWM mode in order to deliver the power needed by the load. In PS mode the STBB3JCC implements a burst mode operation: if the output voltage increases above its nominal value the device stops switching; as soon the V_{OUT} falls below the nominal value the device restarts switching with a programmed average current higher than the one needed by the load. [Figure 29](#) shows PS mode operation areas vs. output current in typical application conditions. If the device is used in HB LED driver configuration, the MODE pin must be pulled high to assure the best dynamic performance at the start-up phase.

Figure 29. Auto mode vs. output current

7.2 External synchronization

The STBB3JCC implements the external synchronization function. If an external clock signal is applied to the MODE/SYN pin with a frequency between 1.6 MHz and 2.4 MHz and with proper low/high levels, the device automatically is in PWM mode and the external clock is used as switching oscillator.

7.3 Enable pin

The device turns on when the EN pin is pulled high. If the EN pin is low the device stops switching and all the internal blocks are turned off. In this condition the current drawn from V_{IN}/V_{INA} is below 1 μ A in the whole temperature range. In addition the internal switches are in off-state so the load is electrically disconnected from the input; this avoids unwanted current leakage from the input to the load. The EN pin can be used as dimming function by applying a square waveform from 100 to 300 Hz.

7.4 Protection features

The STBB3JCC implements different types of protection features.

7.4.1 Soft-start and overcurrent

After the EN pin is pulled high, or after a suitable voltage is applied to V_{IN} , V_{INA} and EN, the device initiates the startup phase. The average current limit is gradually increased while the output voltage increases. As soon as the output voltage reaches 1.0 V, the average current limit is set to its nominal value.

7.4.2 Undervoltage lockout

The undervoltage lockout function prevents improper operation of the STBB3JCC when the input voltage is not high enough. When the input voltage is below the UVLO threshold, the device is in shutdown mode. The hysteresis of 100 mV prevents unstable operation when the input voltage is close to the UVLO threshold.

7.4.3 Overtemperature protection

An internal temperature sensor continuously monitors the IC junction temperature. If the IC temperature exceeds 160 °C (typ.), the device stops operating. As soon as the temperature falls below 140 °C (typ.), normal operation is restored.

8 Application information

8.1 Programming the output voltage

The external resistor divider must be connected between V_{OUT} and GND and the middle point of the divider must be connected to FB.

The value for the resistor R2, placed between FB and GND, should be chosen in order to set the divider current at 10 μ A. The recommended value for this resistor is in the range of 50 k Ω but to reduce the power consumption a maximum value of 20 k Ω can be used.

The value of the resistor R1, connected between V_{OUT} and FB, is function of the output voltage and can be calculated using the equation 1:

Equation 1

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right)$$

Figure 30. Application schematic

8.2 Programming the output constant current for HB WLED

Sensing resistor

The STBB3JCC feedback pin voltage is 100 mV, this makes the STBB3JCC suitable for LED driver applications, minimizing the power dissipation across the external sensing resistor and improving the overall system efficiency. The sensing resistor value is got by the following formula:

Equation 2

$$R_{sense} = R2 = \frac{V_{FB}}{I_{LED}} = \frac{100\text{mV}}{1\text{A}} = 0.1\Omega$$

$$P_{Diss_RSENSE} = R2 \cdot I_{LED}^2 = 0.1 \cdot 1^2 = 0.1\text{W}$$

Figure 31. Application schematic HB WLED driver

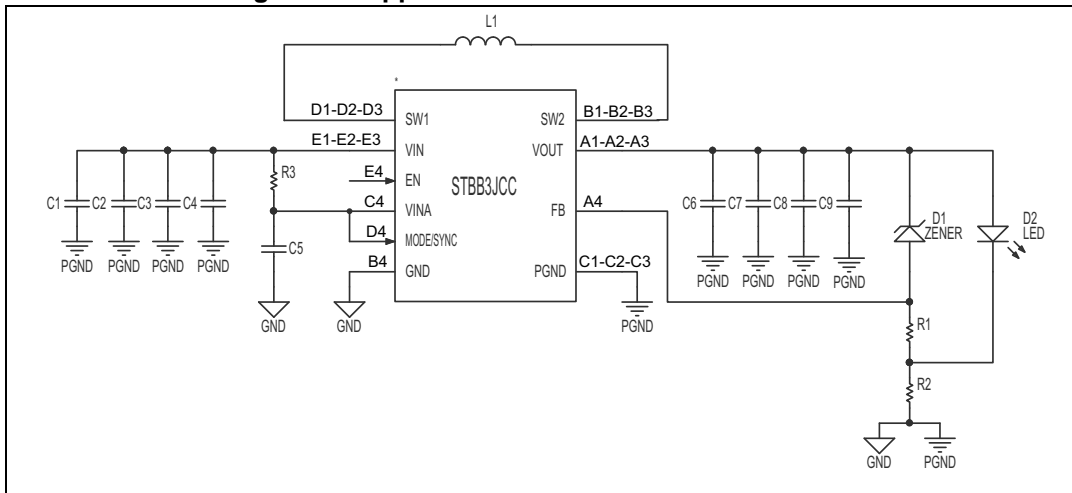

Table 8. List of external components⁽¹⁾

Component	Manufacturer	Part number	Value
C1, C2	Murata	GRM188R60J106ME84	10 μF
C6	Murata	GRM31CB31E226KE15	22 μF
C5	TDK	C1608X7R1H225K	2.2 μF
L1	TDK	VLF403215MT-1R5N	1.5 μH
	Coilcraft	XFL4020-152MEB	
R1 ⁽²⁾	Standard resistor		4.7 K
R3	Standard resistor		from 47 to 100 Ω
D1 ⁽²⁾	Zener diode		4.7 V 1/4 W
R2 ⁽³⁾	Standard resistor		0.1 Ω 1/4 W
LED	White LED		3.7 V _F I _{LED} =1 A

- Above listed components refer to typical application. Operation of the STBB3JCC is not limited to the choice of these external components.
- R1 and D1 are used as V_{OUT} overvoltage protection in case of open-LED failure (these components are optional and they are not mounted on the evaluation board).
- R2 is calculated according to the following formula: $R2 = \frac{V_{FB}}{I_{LED}} = \frac{100\text{mV}}{1\text{A}}$

8.3 Inductor selection

The inductor is the key passive component for switching converters. With a buck-boost device, the inductor selection must take into consideration the following two conditions in which the converter works:

- as buck region at the maximum input voltage
- as boost region at the minimum input voltage

Two critical inductance values are then obtained according to the following formulas:

Equation 3

$$L_{\text{MIN_BUCK}} = \frac{V_{\text{OUT}} \times (V_{\text{IN_MAX}} - V_{\text{OUT}})}{V_{\text{IN_MAX}} \times f_{\text{S}} \times \Delta I_{\text{L}}}$$

Equation 4

$$L_{\text{MIN_BOOST}} = \frac{V_{\text{IN_MIN}} \times (V_{\text{OUT}} - V_{\text{IN_MIN}})}{V_{\text{OUT}} \times f_{\text{S}} \times \Delta I_{\text{L}}}$$

where f_{S} is the minimum value of the switching frequency and ΔI_{L} is the inductor ripple current. The amplitude of the inductor ripple current is typically set between 20% and 40% of the maximum inductor current. To guarantee an inductor ripple current always lower than the selected value ΔI_{L} , the higher value between $L_{\text{MIN_BUCK}}$ and $L_{\text{MIN_BOOST}}$ have to be chosen. In addition to the inductance value, also the maximum current which the inductor can handle must be calculated in order to avoid saturation.

Equation 5

$$I_{\text{PEAK_BUCK}} = \frac{I_{\text{OUT}}}{\eta} + \frac{V_{\text{OUT}} \times (V_{\text{IN_MAX}} - V_{\text{OUT}})}{2 \times V_{\text{IN_MAX}} \times f_{\text{S}} \times L}$$

Equation 6

$$I_{\text{PEAK_BOOST}} = \left(\frac{V_{\text{OUT}} \times I_{\text{OUT}}}{\eta \times V_{\text{IN_MIN}}} \right) + \frac{V_{\text{IN_MIN}} \times (V_{\text{OUT}} - V_{\text{IN_MIN}})}{2 \times V_{\text{OUT}} \times f_{\text{S}} \times L}$$

where η is the estimated efficiency. The maximum of the two values above must be considered when selecting the inductor.

8.4 Input and output capacitor selection

It is recommended to use ceramic capacitors with low ESR as input and output capacitors in order to filter any disturbance present in the input line and to obtain stable operation.

Minimum values of 10 μF for both capacitors, C_{IN} and C_{OUT} , are needed to achieve good behavior of the device. The input capacitor must be placed as close as possible to the device.

An R-C filter is added to VINA pin (R3-C5 [Figure 30](#) and [Figure 31](#)) to assure a clean input voltage to the internal logic block.

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

Table 9. Flip Chip 20 (2.5 x 1.75 mm) mechanical data

Dim.	mm		
	Min.	Typ.	Max.
A	0.50	0.55	0.60
A1	0.17	0.20	0.23
A2	0.33	0.35	0.37
b	0.21	0.25	0.29
D	2.485	2.515	2.545
D1		1.6	
E	1.731	1.761	1.791
E1		1.2	
e		0.40	
fD	0.447	0.457	0.467
fE	0.27	0.28	0.29
SE		0.20	
ccc		0.075	

Note: The terminal A1 on the bump side is identified by a distinguishing feature (for instance by a circular “clear area” typically 0.1 mm diameter) and/or a missing bump.
The terminal A1 on the backside of the product is identified by a distinguishing feature (for instance by a circular “clear area” less than 0.5 mm diameter).

10 Revision history

Table 10. Document revision history

Date	Revision	Changes
23-Oct-2013	1	Initial release.
25-Jun-2014	2	Document status promoted from preliminary to production data.
25-Nov-2014	3	Removed footnote from P-channel and N-channel on-resistance parameter in Table 6.
28-Jan-2015	4	Updated I_{SWL} max. value in Table 6.
16-Dec-2015	5	Updated Figure 1 , Figure 2 , Figure 30 and Figure 31 . Updated Table 2 and Table 8 .
