

# THE DATASHEET OF LMX2433TMX/NOPB

# LMX243x PLLatinum™ Dual High-Frequency Synthesizer for RF Personal Communications

## 1 Features

- Low Current Consumption
  - LMX2430 (RF/IF): 2.8 mA/ 1.4 mA
  - LMX2433 (RF/IF): 3.2 mA/ 2 mA
  - LMX2434 (RF/IF): 4.6 mA/ 2.4 mA
- 2.25-V to 2.75-V Operation
- Synchronous/Asynchronous Power Down
- Multiple PLL Options:
  - LMX2430 (RF/IF): 3 GHz /0.8 GHz
  - LMX2433 (RF/IF): 3.6 GHz /1.7 GHz
  - LMX2434 (RF/IF): 5 GHz /2.5 GHz
- Programmable Charge-Pump Current Levels
  - RF and IF: 1 or 4 mA
- Fastlock With Integrated Time-Out Counters
- Digital Filtered Lock-Detect Output
- Analog Lock Detect (Push-Pull / Open-Drain)
- 1.8-V MICROWIRE Logic Interface

## 2 Applications

- Mobile Handsets
- Cordless Handsets
- Wireless Data
- Cable TV Tuners

## 3 Description

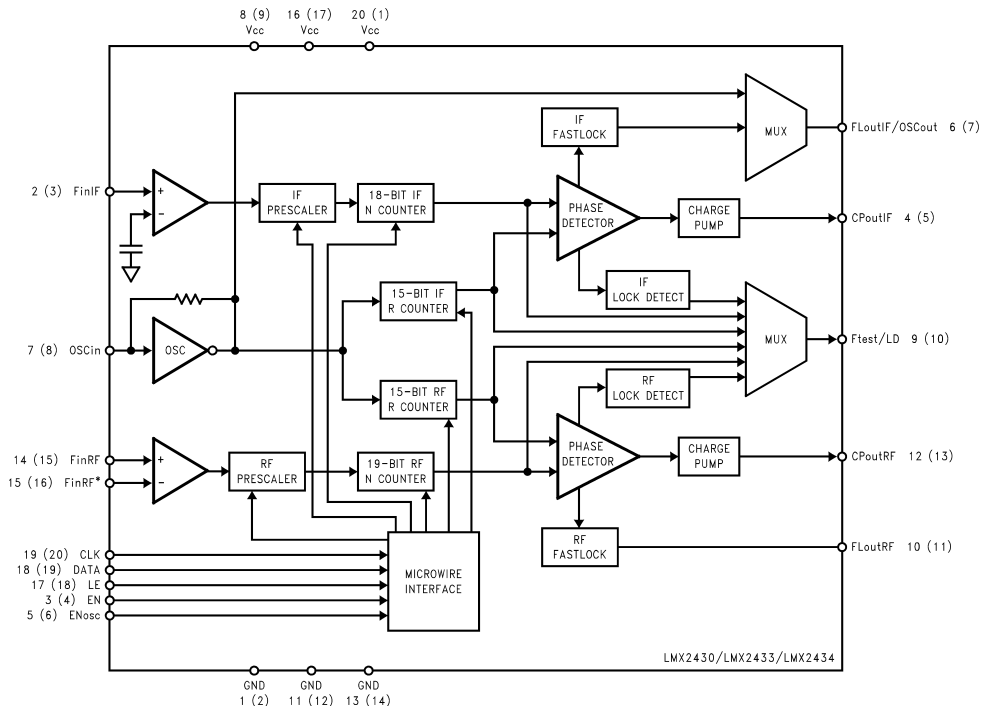

Using a proprietary digital-phase, locked-loop technique, the LMX243x devices generate very stable, low-noise control signals for RF and IF voltage controlled oscillators. Both the RF and IF synthesizers include a two-level programmable charge pump. Both the RF and IF PLLs have dedicated fastlock circuitry with integrated time-out counters which require only a single word write to power up or change frequencies.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMX243x	ULGA (20)	3.50 mm x 3.50 mm
	TSSOP (20)	6.50 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Functional Block Diagram

NOTE: 1 (2) refers to Pin 1 of the 20-Pin ULGA and Pin 2 of the 20-Pin TSSOP

## 5 Description continued

The LMX243x devices are high-performance frequency synthesizers with integrated dual-modulus prescalers. A 32/33 or a 16/17 prescale ratio can be selected for the 5-GHz LMX2434 RF synthesizer. An 8/9 or a 16/17 prescale ratio can be selected for both the LMX2430 and LMX2433 RF synthesizers. The IF circuitry contains an 8/9 or a 16/17 prescaler.

Serial data is transferred to the devices through a three-wire interface (DATA, LE, CLK). A low voltage logic interface allows direct connection to 1.8-V devices. Supply voltages from 2.25 V to 2.75 V are supported.

## 6 Pin Configuration and Functions

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	ULGA	TSSOP		
CLK	18	19	I	MICROWIRE Clock input. High-impedance CMOS input. DATA is clocked into the 24-bit shift register on the rising edge of CLK.
CPoutIF	4	5	O	IF PLL charge-pump output. The output is connected to the external loop filter, which drives the input of the IF VCO.
CPoutRF	12	13	O	RF PLL charge-pump output. The output is connected to the external loop filter, which drives the input of the RF VCO.
DATA	19	20	I	MICROWIRE Data input. High-impedance CMOS input. Binary serial data. The MSB of DATA is shifted in first. The two last bits are the control bits.
EN	3	4	I	Chip Enable input. High-impedance CMOS input. When this pin is set HIGH, the RF and IF PLLs are powered up. Power down is then controlled through the MICROWIRE. When this pin is set LOW, the device is asynchronously powered down, and the charge-pump output is forced to a high-impedance state (tri-state).
ENosc	5	6	I	Oscillator Enable input. High-impedance CMOS input. When this pin is set HIGH, the oscillator buffer is always powered up, independent of the state of the EN pin. When this pin is set LOW, the OSCout/ FLoutIF pin functions as an IF fastlock output, which connects a resistor in parallel to R2 of the external loop filter.
FinIF	2	3	I	IF PLL prescaler input. Small signal input from the VCO.
FLoutRF	10	11	O	RF PLL fastlock output. This pin connects a resistor in parallel to R2 of the external loop filter. This pin can also function as a general-purpose CMOS tri-state output.
FinRF	14	15	I	RF PLL prescaler input. Small-signal input from the VCO.
FinRF*	15	16	I	RF PLL prescaler complementary input. For single-ended operation, this pin must be AC grounded through a 100-pF capacitor. The LMX243x can be driven differentially when the AC-coupled capacitor is omitted.

**Pin Functions (continued)**

PIN			I/O	DESCRIPTION
NAME	ULGA	TSSOP		
Ftest/LD	9	10	O	Programmable multiplexed output. Functions as a general-purpose CMOS tri-state output, N and R divider output, RF/ IF PLL push-pull analog lock-detect output, RF/ IF PLL open-drain analog lock-detect output, or RF/ IF PLL digital filtered lock-detect output.
GND	1	2	—	Ground for the IF PLL analog and digital circuits, MICROWIRE, Ftest/LD and oscillator circuits.
	11	12		
	13	14		
LE	17	18	I	MICROWIRE Latch Enable input. High-impedance CMOS input. When LE transitions HIGH, DATA stored in the shift register is loaded into one of 6 internal control registers.
OSCOut/ FLoutIF	6	7	O	Oscillator output/ IF PLL fastlock output. The output configuration is dependent on the state of the ENosc pin. When ENosc is set LOW, the pin functions as an IF fastlock output, which connects a resistor in parallel to R2 of the external loop filter. This configuration also functions as a general-purpose CMOS tri-state output. When ENosc is set HIGH, the pin functions as an oscillator output so that an external crystal can be used.
OSCIin	7	8	I	Reference oscillator input. The input has an approximate $V_{CC}/2$ threshold and is driven by an external AC-coupled source.
Vcc	16	17	—	Power supply bias for the RF PLL analog circuits. Vcc may range from 2.25 V to 2.75 V. Bypass capacitors must be placed as close as possible to this pin and be connected directly to the ground plane.
	8	9		
	20	1		

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 See <sup>(1)(2)(3)(4)</sup>

		MIN	MAX	UNIT
	Power supply voltage $V_{CC}$ to GND	-0.3	3.25	V
$V_I$	Voltage on any pin to GND $V_I$ must be $< +3.25$ V	-0.3	$V_{CC} + 0.3$	V
$T_L$	Lead temperature (solder 4 seconds)		260	°C
$T_{stg}$	Storage temperature	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- This device is a high-performance RF integrated circuit with an ESD rating  $< 2000$  V and is ESD-sensitive. Handling and assembly of this device must be done at ESD-protected work stations.
- GND = 0 V.
- If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/Distributors for availability and specifications.

### 7.2 Recommended Operating Conditions

	MIN	MAX	UNIT
Power supply voltage $V_{CC}$ to GND	2.25	2.75	V
Operating temperature, $T_A$	-40	85	°C

### 7.3 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LMX243x		UNIT
		NPE (ULGA)	PW (TSSOP)	
		20 PINS	20 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	80.9	111.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	22.5	44.9	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	40	63.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	6.1	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	40	62.8	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## Electrical Characteristics (continued)

 $V_{CC} = EN = 2.5\text{ V}$ ,  $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ , unless otherwise specified

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>PHASE NOISE CHARACTERISTICS</b>						
$L_{NRF}(f)$	RF synthesizer normalized phase noise contribution <sup>(6)</sup>	TCXO Reference Source RF_CPG Bit = 1 IF_PD Bit = 1		-219		dBc/Hz
$L_{NIF}(f)$	IF synthesizer normalized phase noise contribution <sup>(6)</sup>	TCXO Reference Source IF_CPG Bit = 1 RF_PD Bit = 1		-214		dBc/Hz
$L_{RF}(f)$	RF synthesizer single-side band phase noise measured	LMX2430	$f_{FinRF} = 2750\text{ MHz}$ $f = 10\text{-kHz offset}$ $f_{COMPRF} = 1\text{ MHz}$ Loop Bandwidth = 100 kHz $N_{RF} = 2750$ $f_{OSCin} = 10\text{ MHz}$ $V_{OSCin} = 1\text{ V}_{PP}$ RF_CPG Bit = 1 IF_PD Bit = 1 $T_A = 25^{\circ}\text{C}^{(7)}$		-90.3	dBc/Hz
		LMX2433	$f_{FinRF} = 3200\text{ MHz}$ $f = 10\text{-kHz offset}$ $f_{COMPRF} = 1\text{ MHz}$ Loop Bandwidth = 100 kHz $N_{RF} = 3200$ $f_{OSCin} = 10\text{ MHz}$ $V_{OSCin} = 1\text{ V}_{PP}$ RF_CPG Bit = 1 IF_PD Bit = 1 $T_A = 25^{\circ}\text{C}^{(7)}$		-88.9	dBc/Hz
		LMX2434	$f_{FinRF} = 4700\text{ MHz}$ $f = 10\text{-kHz offset}$ $f_{COMPRF} = 1\text{ MHz}$ Loop Bandwidth = 100 kHz $N_{RF} = 4700$ $f_{OSCin} = 10\text{ MHz}$ $V_{OSCin} = 1\text{ V}_{PP}$ RF_CPG Bit = 1 IF_PD Bit = 1 $T_A = 25^{\circ}\text{C}^{(7)}$		-85.6	dBc/Hz

(6) Normalized Phase Noise Contribution is defined as  $L_N(f) = L(f) - 20 \log(N) - 10 \log(f_{COMP})$ , where  $L(f)$  is defined as the single side band phase noise measured at an offset frequency,  $f$ , in a 1-Hz bandwidth. The offset frequency,  $f$ , must be chosen sufficiently smaller than the loop bandwidth of the PLL, yet large enough to avoid substantial phase noise contribution from the reference source.  $N$  is the value selected for the feedback divider and  $f_{COMP}$  is the RF/IF phase and frequency detector comparison frequency.

(7) The synthesizer phase noise is measured with the LMX2430PW/LMX2430NPE evaluation boards and the HP8566B Spectrum Analyzer.

## 7.5 Timing Requirements

 See <sup>(1)</sup>

		MIN	NOM	MAX	UNIT
<b>MICROWIRE INTERFACE</b>

## 8 Parameter Measurement Information

### 8.1 Bench Test Setups

#### 8.1.1 LMX243x Charge-Pump Test Setup

Figure 23. Charge-Pump Current Test Setup

Figure 23 shows the setup required to measure the RF charge-pump sink current of the LMX243x device. The same setup is used for the LMX2430PW evaluation board. The purpose of this test is to assess the functionality of the RF charge pump. The IF charge pump is evaluated in the same way.

This setup uses an open-loop configuration. A power supply is connected to  $V_{CC}$ . By means of a signal generator, a 10-MHz signal is typically applied to the FinRF pin. The signal is one of two inputs to the phase / frequency detector (PFD). The 3-dB pad provides a 50-Ω match between the PLL and the signal generator. The OSCin pin is tied to  $V_{CC}$ . This establishes the other input to the PFD. Alternatively, this input can be tied directly to the ground plane. The EN and ENosc pins are also both tied to  $V_{CC}$ . A semiconductor parameter analyzer is connected to the CPoutRF pin and used to measure the sink, source, and tri-state leakage currents.

Let  $F_r$  represent the frequency of the signal applied to the OSCin pin, which is simply zero in this case (DC), and let  $F_p$  represent the frequency of the signal applied to the FinRF pin. The PFD is sensitive to the rising edges of  $F_r$  and  $F_p$ . Assuming positive VCO characteristics (RF\_CPP bit = 1); the charge pump turns ON, and sinks current when the first rising edge of  $F_p$  is detected. Because  $F_r$  has no rising edge, the charge pump continues to sink current indefinitely. In order to measure the RF charge-pump source current, the RF\_CPP bit is simply set to 0 (negative VCO characteristics) in CodeLoader. Similarly, in order to measure the tri-state leakage current, the RF\_CPT bit is set to 1.

## Bench Test Setups (continued)

The measurements are typically taken over supply voltage and temperature. The measurements are also typically taken at the HIGH and LOW charge-pump current gains. The charge-pump current gain can be controlled by the RF\_CPG bit in CodeLoader. Once the charge-pump currents are determined, the (i) charge-pump output current magnitude variation versus charge-pump output voltage, (ii) charge-pump output sink current versus charge-pump output source current mismatch, and (iii) charge-pump output current magnitude versus temperature, can be calculated. Refer to the [Charge Pump Current Specifications Definition](#) for more details.

### 8.1.2 Charge-Pump Current Specification Definitions

I1 = Charge-Pump Sink Current at  $V_{CPout} = V_{CC} - \Delta V$

I2 = Charge-Pump Sink Current at  $V_{CPout} = V_{CC}/2$

I3 = Charge-Pump Sink Current at  $V_{CPout} = \Delta V$

I4 = Charge-Pump Source Current at  $V_{CPout} = V_{CC} - \Delta V$

I5 = Charge-Pump Source Current at  $V_{CPout} = V_{CC}/2$

I6 = Charge-Pump Source Current at  $V_{CPout} = \Delta V$

$\Delta V$  = Voltage offset from the positive and negative rails. Dependent on the VCO tuning range relative to  $V_{CC}$  and GND. Typical values are between 0.5V and 1.0V.

$V_{CPout}$  refers to either  $V_{CPoutRF}$  or  $V_{CPoutIF}$

$I_{CPout}$  refers to either  $I_{CPoutRF}$  or  $I_{CPoutIF}$

**Figure 24. Charge-Pump Parameters**

#### 8.1.2.1 Charge-Pump Output Current Variation vs Charge-Pump Output Voltage

$$I_{CPout} \text{ Vs } V_{CPout} = \frac{(|I1| - |I3|)}{(|I1| + |I3|)} \times 100\%$$

$$= \frac{(|I4| - |I6|)}{(|I4| + |I6|)} \times 100\% \quad (1)$$

#### 8.1.2.2 Charge-Pump Sink Current vs Charge-Pump Output Source Current Mismatch

$$I_{CPout} \text{ Sink Vs } I_{CPout} \text{ Source} = \frac{|I2| - |I5|}{\frac{1}{2}(|I2| + |I5|)} \times 100\% \quad (2)$$

## Bench Test Setups (continued)

### 8.1.2.3 Charge-Pump Output Current Variation vs Temperature

$$I_{CPout} \text{ Vs } T_A = \frac{|I_2|_{T_A} - |I_2|_{T_A=25^\circ\text{C}}}{|I_2|_{T_A=25^\circ\text{C}}} \times 100\%$$

$$= \frac{|I_5|_{T_A} - |I_5|_{T_A=25^\circ\text{C}}}{|I_5|_{T_A=25^\circ\text{C}}} \times 100\%$$

(3)

### 8.1.3 LMX243x FinRF Sensitivity Test Setup

Figure 25. RF Input Sensitivity Test Setup

Figure 25 shows the setup required to measure the RF input sensitivity level of the LMX243x device. The same setup is used for the LMX2430PW evaluation board. The purpose of this test is to measure the acceptable signal level to the FinRF input of the PLL chip. Outside the acceptable signal range, the feedback divider begins to divide incorrectly and miscount the frequency. The FinIF sensitivity is evaluated in the same way.

The setup uses an open-loop configuration. A power supply is connected to Vcc. The IF PLL is powered down (IF\_PD bit = 1). By means of a signal generator, an RF signal is applied to the FinRF pin. The 3-dB pad provides a 50-Ω match between the PLL and the signal generator. The EN, ENosc, and OSCin pins are all tied to Vcc. The N value is typically set to 10000 in CodeLoader, that is, RF\_B word = 156 and RF\_A word = 16 for RF\_P bit = 0 (LMX2434) or RF\_P bit = 1 (LMX2430 and LMX2433). The feedback divider output is routed to the Ftest/LD

## Bench Test Setups (continued)

pin by selecting the RF\_N/2 Frequency word (MUX[3:0] word = 15) in CodeLoader. A Universal Counter is connected to the Ftest/LD pin and used to monitor the output frequency of the feedback divider. The expected frequency must be the signal generator frequency divided by twice the corresponding counter value, that is, 20,000. The factor of two comes in because the LMX43x device has an internal /2 circuit which is used to provide a 50% duty cycle.

Sensitivity is typically measured over frequency, supply voltage and temperature. In order to perform the measurement, the temperature, frequency, and supply voltage is set to a fixed value, and the power level of the signal at FinRF is varied. Sensitivity is reached when the frequency error of the divided RF input is greater than or equal to 1 Hz. The power attenuation from the cable and the 3-dB pad must be accounted for. The feedback divider miscounts if too much or too little power is applied to the FinRF input. Therefore, the allowed input power level is bounded by the upper and lower sensitivity limits. In a typical application, if the power level to the FinRF input approaches the sensitivity limits, this can introduce spurs or cause degradation to the phase noise. When the power level gets even closer to these limits, or exceeds them, the RF PLL loses lock.

### 8.1.4 LMX243x OSCin Sensitivity Test Setup

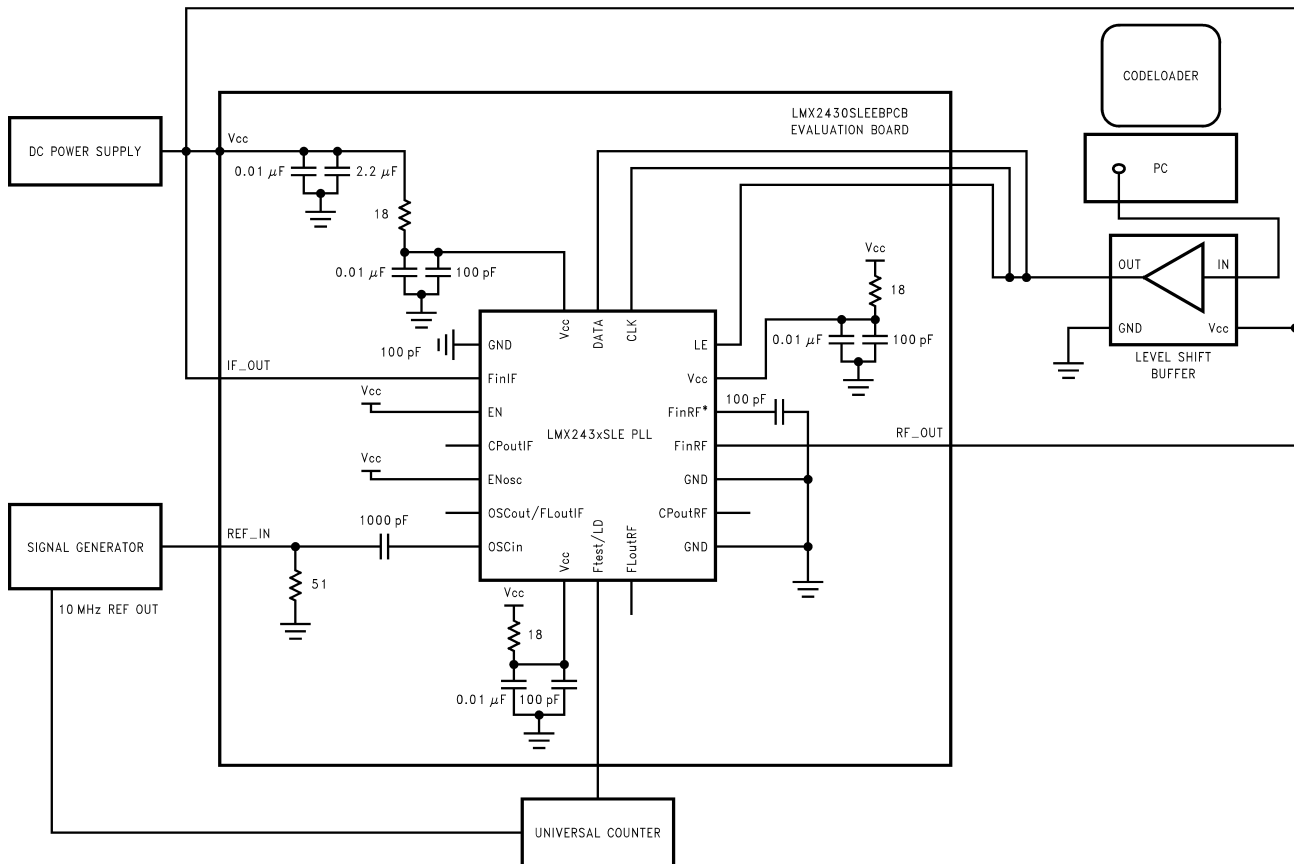

Figure 26. OSCin Sensitivity Test Setup

Figure 26 shows the setup required to measure the OSCin buffer sensitivity level in the LMX243x device. The same setup is used for the LMX2430PW evaluation board. This setup is similar to the FinRF sensitivity setup except that the signal generator is now connected to the OSCin pin, and both Fin pins are tied to V<sub>CC</sub>. The 51-Ω shunt resistor matches the OSCin input to the signal generator. The R counter is typically set to 1000, that is, RF\_R word = 1000 or IF\_R word = 1000. The reference divider output is routed to the Ftest/LD pin by selecting

### Bench Test Setups (continued)

the RF\_R/ 2 frequency word (MUX[3:0] word = 14) or the IF\_R/ 2 frequency word (MUX[3:0] word = 12) in CodeLoader. A universal counter is connected to the Ftest/LD pin and is used to monitor the output frequency of the reference divider. The expected frequency must be the signal generator frequency divided by twice the corresponding counter value, that is, 2000. The factor of two comes in because the LMX243x device has an internal /2 circuit which is used to provide a 50% duty cycle.

In a similar way, sensitivity is typically measured over frequency, supply voltage and temperature. In order to perform the measurement, the temperature, frequency, and supply voltage is set to a fixed value and the power level (voltage level) of the signal at OSCin is varied. Sensitivity is reached when the frequency error of the divided input signal is greater than or equal to 1 Hz.

#### 8.1.5 LMX243x FinRF Input Impedance Test Setup

Figure 27. Input Impedance Test Setup

**Notes:**

1. DATA is clocked into the 24-bit shift register on the rising edge of CLK
2. The MSB of DATA is shifted in first.

Figure 28. LMX243x Serial Data Input Timing

## Bench Test Setups (continued)

Figure 28 shows the setup required to measure the RF input impedance of the LMX243x device. The same setup is used for the LMX2430PW evaluation board. Measuring the input impedance of the device facilitates the design of appropriate matching networks to match the PLL to the VCO, or in more critical situations, to the characteristic impedance of the printed-circuit-board (PCB) trace, to prevent undesired transmission line effects. The FinIF input impedance is evaluated in the same way.

Before the actual measurements are taken, the network analyzer must be calibrated, that is, the error coefficients must be calculated. The calibration standard of the network analyzer is used to calculate these coefficients. The calibration standard includes an open, short and a matched load. A 1-port calibration is implemented here.

To calculate the coefficients, the PLL chip is first removed from the PCB. A piece of semi-rigid coaxial cable is then soldered to the pad on the PCB which is equivalent to the FinRF pin on the PLL chip. Proper grounding near the exposed tip of the semi-rigid coaxial cable is required for accurate results. The DC blocking capacitor is removed for this test. The network analyzer port is then connected to the other end of the semi-rigid coaxial cable. In this way, the semi-rigid coaxial cable acts as a transmission line. This transmission line adds electrical length and produces an offset from the reference plane of the network analyzer; therefore, it must be included in the calibration. The desired operating frequency is then set. The typical frequency range selected for the RF synthesizer of the LMX243x device is from 100 MHz to 6000 MHz.

The network analyzer calculates the calibration coefficients based on the measured  $S_{11}$  parameters. With this all done, calibration is now complete.

The PLL chip is then placed on the PCB, and a power supply connected to  $V_{CC}$ . The EN, ENosc, and OSCin pins are all tied to  $V_{CC}$ . Alternatively, the OSCin pin can be tied to ground. In this setup, the complementary input (FinRF\*) is AC-coupled to ground. With the network analyzer still connected to the semi-rigid coaxial cable, the measured FinRF impedance is displayed.

The OSCin input impedance is measured in the same way. The impedance is measured when the oscillator buffer is powered up (ENosc is set HIGH) and when the oscillator buffer is powered down (ENosc pin is set LOW).

## 9 Detailed Description

### 9.1 Overview

The basic phase-locked-loop (PLL) configuration consists of a high-stability crystal reference oscillator, a frequency synthesizer such as the LMX243x, a voltage controlled oscillator (VCO), and a passive loop filter. The frequency synthesizer includes a phase detector, current-mode charge pump, programmable reference R and feedback N frequency dividers. The VCO frequency is established by dividing the crystal reference signal down through the reference divider to obtain a comparison reference frequency. This reference signal,  $f_r$ , is then presented to the input of a phase / frequency detector and compared with the feedback signal,  $f_p$ , which was obtained by dividing the VCO frequency down by way of the feedback divider. The phase and frequency detector (PFD) measures the phase error between the  $f_r$  and  $f_p$  signals and outputs control signals that are directly proportional to the phase error. The charge pump then pumps charge into or out of the loop filter based on the magnitude and direction of the phase error. The loop filter converts the charge into a stable control voltage for the VCO. The function of the PFD is to adjust the voltage presented to the VCO until the frequency of the feedback signal and phase match that of the reference signal. When this *phase-locked* condition exists, the VCO frequency is N times that of the comparison frequency, where N is the feedback divider ratio.

### 9.2 Functional Block Diagram

## 9.3 Feature Description

### 9.3.1 Reference Oscillator Input

The reference oscillator frequency for both the RF and IF PLLs is provided from an external reference through the OSCin pin. The reference buffer circuit supports input frequencies from 5 to 40 MHz with a minimum input sensitivity of 0.5 V<sub>PP</sub>. The reference buffer circuit has an approximate V<sub>CC</sub>/2 input threshold and can be driven from an external AC-coupled source. Typically, the OSCin pin is connected to the output of a crystal oscillator.

### 9.3.2 Reference Dividers (R Counters)

The reference dividers divide the reference input signal, OSCin, by a factor of R. The output of the reference divider circuits feeds the reference input of the phase detector. This reference input to the phase detector is often referred to as the comparison frequency. The divide ratio must be chosen such that the maximum phase comparison frequency (f<sub>COMPRF</sub> or f<sub>COMPIF</sub>) of 10 MHz is not exceeded.

The RF and IF reference dividers are each comprised of 15-bit CMOS binary counters that support a continuous integer divide ratio from 3 to 32,767. The RF and IF reference divider circuits are clocked by the output of the reference buffer circuit which is common to both. Refer to [RF\\_R\[14:0\] - RF Synthesizer Programmable Reference Divider \(R Counter\) \(R0\[17:3\]\)](#) and [IF\\_R\[14:0\] - IF Synthesizer Programmable Reference Divider \(R Counter\) \(R3\[17:3\]\)](#) for details on how to program the RF\_R and IF\_R counters.

### 9.3.3 Prescalers

The FinRF and FinIF input pins drive the input of a differential-pair amplifier. The output of the differential-pair amplifier drives a chain of D-type flip-flops in a dual modulus configuration. The output of the prescaler is used to clock the subsequent feedback dividers. The RF PLL complementary inputs can be driven differentially, or the negative input can be AC-coupled to ground through an external capacitor for single-ended configuration. A 16/17 or a 32/33 prescale ratio can be selected for the 5-GHz LMX2434 RF synthesizer. An 8/9 or a 16/17 prescale ratio can be selected for both the LMX2430 and LMX2433 RF synthesizers. The IF PLL is single-ended, and an 8/9 or a 16/17 prescale ratio can be selected for the IF synthesizer.

### 9.3.4 Programmable Feedback Dividers (N Counters)

The programmable feedback dividers operate in concert with the prescalers to divide the input signal, Fin, by a factor of N. The output of the programmable reference divider is provided to the feedback input of the phase detector circuit. The divide ratio must be chosen so that the maximum phase comparison frequency (f<sub>COMPRF</sub> or f<sub>COMPIF</sub>) of 10 MHz is not exceeded.

The programmable feedback divider circuit is comprised of an A counter (swallow counter) and a B counter (programmable binary counter). For both the LMX2430 and LMX2433, the RF\_A counter is a 4-bit swallow counter, programmable from 0 to 15. The LMX2434 RF\_A counter is a 5-bit swallow counter, programmable from 0 to 31. The LMX243x IF\_A counter is a 4-bit swallow counter, programmable from 0 to 15. For both the LMX2430 and LMX2433, the RF\_B counter is a 15-bit binary counter, programmable from 3 to 32,767. The LMX2434 RF\_B counter is a 14-bit binary counter, programmable from 3 to 16,383. The LMX243x IF\_B is a 14-bit binary counter programmable from 3 to 16,383. A continuous integer divide ratio is achieved if  $N \geq P \times (P-1)$ , where P is the value of the prescaler selected.

Divide ratios less than the minimum continuous divide ratio are achievable as long as the binary programmable counter value is greater than the swallow counter value ( $B \geq A$ ). Refer to [RF\\_A\[3:0\] - LMX2430/33 RF Synthesizer Swallow Counter \(A Counter\) \(R1\[6:3\]\)](#), [RF\\_A\[4:0\] - LMX2434 RF Synthesizer Swallow Counter \(A Counter\) \(R1\[7:3\]\)](#), [RF\\_B\[14:0\] - LMX2430/33 RF Synthesizer Programmable Binary Counter \(B Counter\) \(R1\[21:8\]\)](#), [RF\\_B\[13:0\] - LMX2434 RF Synthesizer Programmable Binary Counter \(B Counter\) \(R1\[21:8\]\)](#), [IF\\_A\[3:0\] - IF Synthesizer Swallow Counter \(A Counter\) \(R4\[6:3\]\)](#), and [IF\\_B\[13:0\] - IF Synthesizer Programmable Binary Counter \(B Counter\) \(R4\[20:7\]\)](#) for details on how to program the A and B counters. [Equation 4](#) and [Equation 5](#) are useful in determining and programming a particular value of N:

$$N = (P \times B) + A \quad (4)$$

$$F_{in} = N \times f_{COMP} \quad (5)$$

## Feature Description (continued)

### 9.3.5 Phase / Frequency Detectors

The RF and IF PFDs are driven from their respective N and R counter outputs. The maximum frequency for both the RF and IF phase detector inputs is 10 MHz. The PFD outputs control the respective charge pumps. The polarity of the pump-up or pump-down control signals are programmed using the *RF\_CPP* or *IF\_CPP* control bits, depending on whether the RF or IF VCO characteristics are positive or negative. Refer to [RF\\_CPP - RF Synthesizer Phase Detector Polarity \(R0\[18\]\)](#) and [IF\\_CPP - IF Synthesizer Phase Detector Polarity \(R3\[18\]\)](#) for more details. The PFDs have a detection range of  $-2\pi$  to  $+2\pi$ . The PFDs also receive a feedback signal from the charge pump in order to eliminate dead zone.

#### 9.3.5.1 Phase Comparator and Internal Charge-Pump Characteristics

**Notes:**

1. The minimum width of the pump-up and pump-down current pulses occur at the CPoutRF or CPoutIF pins when the loop is phase locked.
2. The diagram assumes positive VCO characteristic that is, *RF\_CPP* or *IF\_CPP* = 1.
3.  $f_r$  is the PFD input from the reference divider (R counter).
4.  $f_p$  is the PFD input from the programmable feedback divider (N counter).
5. CPout refers to either the RF or IF charge-pump output

**Figure 29. Phase Detector and Charge-Pump Operation**

### 9.3.6 Charge Pumps

The charge pump directs charge into or out of an external loop filter. The loop filter converts the charge into a stable control voltage which is applied to the tuning input of the VCO. The charge pump steers the VCO control voltage towards  $V_{CC}$  during pump-up events and towards GND during pump-down events. When locked, CPoutRF or CPoutIF are primarily in a tri-state mode with small corrections occurring at the phase comparator rate. The charge-pump output current magnitude can be selected by toggling the *RF\_CPG* or *IF\_CPG* control bits.

### 9.3.7 Microwire Serial Interface

The programmable register set is accessed through the MICROWIRE serial interface. A low voltage logic interface allows direct connection to 1.8-V devices. The interface is comprised of three signal pins: CLK, DATA and LE. Serial data is clocked into the 24-bit shift register on the rising edge of CLK. The last two bits decode the internal control register address. When LE transitions HIGH, DATA stored in the shift register is loaded into one of four control registers depending on the state of the address bits. The MSB of DATA is loaded in first. The synthesizers can be programmed even in power-down mode. A complete programming description is provided in [Programming](#).

### 9.3.8 Multi-Function Outputs

The Ftest/LD output pin of the LMX243x device is a multi-function output that can be configured as a general-purpose CMOS tri-state output, push-pull analog lock-detect output, open-drain analog lock-detect output, digital filtered lock-detect output, or used to monitor the output of the various reference divider (R counter) or feedback divider (N counter) circuits. The Ftest/LD control word is used to select the desired output function. When the PLL is in power-down mode, the Ftest/LD output is disabled and is in a high-impedance state. A complete programming description of the multi-function output is provided in [MUX\[3:0\] - Multifunction Output Select \(R3\[23:22\];R0\[23:22\]\)](#).

## Feature Description (continued)

### 9.3.8.1 Push-Pull Analog Lock-Detect Output

An analog lock-detect status generated from the phase detector is available on the Ftest/LD output pin if selected. A push-pull configuration can be selected for the lock-detect output signal. With this configuration, the lock-detect output goes HIGH when the charge pump is inactive. It goes LOW when the charge pump is active during a comparison cycle. Narrow low-going pulses are observed when the charge pump turns on.

There are three separate push-pull analog lock-detect signals that are routed to the multiplexer. Two of these monitor the lock status of the individual synthesizers. The third detects the condition when both the RF and IF synthesizers are in a locked state. External circuitry is required to provide a steady DC signal to indicate when the PLL is in a locked state. Refer to [MUX\[3:0\] - Multifunction Output Select \(R3\[23:22\]:R0\[23:22\]\)](#) for details on how to program the different push-pull analog lock-detect options.

### 9.3.8.2 Open-Drain Analog Lock-Detect Output

The lock-detect output can be an open-drain configuration. In this configuration, the lock-detect output goes to a high impedance state when the charge pump is inactive. It goes LOW when the charge pump is active during a comparison cycle. When a pullup resistor is used, narrow low-going pulses are observed when the charge pump turns on.

Similarly, three separate open-drain analog lock-detect signals are routed to the multiplexer. Two of these monitor the lock status of the individual synthesizers. The third detects the condition when both the RF and IF synthesizers are in a locked state. External circuitry is required to provide a steady DC signal to indicate when the PLL is in a locked state. Refer to [MUX\[3:0\] - Multifunction Output Select \(R3\[23:22\]:R0\[23:22\]\)](#) for details on how to program the different open-drain analog lock-detect options.

### 9.3.8.3 Digital Filtered Lock-Detect Output

A digital filtered lock-detect status generated from the phase detector is also available on the Ftest/LD output pin if selected. The lock-detect digital filter compares the difference between the phases of the inputs to the PFD to an RC-generated delay of approximately 15 ns. If the phase error is less than the 15-ns RC delay for 5 consecutive reference cycles, the PLL enters a locked state (HIGH). Once in lock, the RC delay is changed to approximately 30 ns. Once the phase error becomes greater than the 30-ns RC delay, the PLL falls out of lock (LOW). When the PLL is in power-down mode, the Ftest/LD output is forced LOW. A flow chart of the digital filtered lock-detect output is shown in [Figure 30](#).

Feature Description (continued)

Figure 30. Digital Lock-Detect Operation

Similarly, three separate digital filtered lock-detect signals are routed to the multiplexer. Two of these monitor the lock status of the individual synthesizers. The third detects the condition when both the RF and IF synthesizers are in a locked state. External circuitry is not required when the digital filtered lock-detect option is selected. Refer to [MUX\[3:0\] - Multifunction Output Select \(R3\[23:22\]:R0\[23:22\]\)](#) for details on how to program the different digital filtered lock-detect options.

9.3.8.4 Reference Divider and Feedback Divider Output

The outputs of the various N and R dividers can be monitored by selecting the appropriate Ftest/LD word. This is essential when performing OSCin or Fin sensitivity measurements. Refer to the [LMX243x FinRF Sensitivity Test Setup](#) or [LMX243x OSCin Sensitivity Test Setup](#) sections for more details.

## Feature Description (continued)

### NOTE

The R and N outputs that are routed to the Ftest/LD are R/2 and N/2, respectively. The internal /2 circuit is used to provide a 50% duty cycle. Refer to [MUX\[3:0\] - Multifunction Output Select \(R3\[23:22\]:R0\[23:22\]\)](#) for more details on how to route the appropriate divider output to the Ftest/LD pin.

### 9.3.9 Fastlock Output

The LMX243x fastlock feature allows a faster loop response time during lock acquisition. The loop response time (lock time) can be approximately halved if the loop bandwidth is doubled. In order to achieve this, the same gain / phase relationship must be maintained when the loop bandwidth is doubled. When the FLoutRF or OSCout/ FLoutIF pins are configured as fastLock outputs, an open-drain device is enabled. The open-drain device switches in a resistor parallel, and of equal value, to R2 of the external loop filter.

The loop bandwidth is effectively doubled and stability is maintained. Once locked to the correct frequency, the PLL returns to a steady-state condition. The LMX243x offers two methods to achieve fastlock: manual and automatic. Manual fastlock is achieved by increasing the charge pump current from 1 mA (RF\_CPG/ IF\_CPG Bit = 0) in the steady-state mode, to 4 mA (RF\_CPG/ IF\_CPG Bit = 1) in fastlock mode. Automatic fastlock is achieved by programming the time-out counter register (RF\_TOC/ IF\_TOC) with the appropriate number of phase comparison cycles that the RF/ IF synthesizer spends in the fastlock state. Refer to [R2 Register](#) and [R5 Register](#) for details on how to configure the FLoutRF or OSCout/ FLoutIF output to an open-drain fastlock output.

### 9.3.10 Counter Reset

When the RF\_RST/ IF\_RST bit is enabled, both the feedback divider (RF\_N/ IF\_N) and reference divider (RF\_R/ IF\_R) are held at their load point. When the device is programmed to normal operation, both the feedback divider and reference divider are enabled and resume counting in close alignment to each other. Refer to [RF\\_RST - RF Synthesizer Counter Reset \(R0\[21\]\)](#) and [IF\\_RST - IF Synthesizer Counter Reset \(R3\[21\]\)](#) for more details.

## 9.4 Device Functional Modes

### 9.4.1 Power Control

The LMX243x device can be asynchronously powered down when the EN pin is set LOW, independent of the state of the power-down bits.

### NOTE

The OSCout/ FLoutIF pin can still be enabled if the ENosc pin is set HIGH, independent of the state of the EN pin. This capability allows the oscillator buffer to be used as a crystal oscillator.

When EN is set HIGH, power down is controlled through the MICROWIRE. The power-down word is comprised of the RF\_PD/ IF\_PD bit, in conjunction with the RF\_CPT/ IF\_CPT bit. The power-down control word is used to set the operating mode of the device. Refer to [RF\\_CPT - RF Synthesizer Charge-Pump Tri-State \(R0\[20\]\)](#), [RF\\_PD - RF Synthesizer Power Down \(R1\[23\]\)](#), [IF\\_CPT - IF Synthesizer Charge-Pump Tri-State \(R3\[20\]\)](#), and [IF\\_PD - IF Synthesizer Power Down \(R4\[23\]\)](#) for details on how to program the RF or IF power-down bits.

When either synthesizer is powered down, the respective prescaler, phase detector, and charge-pump circuit is disabled. The CPoutRF/ CPoutIF, FinRF/ FinIF, and FinRF\* pins are all forced to a high impedance state. The reference divider and feedback divider circuits are held at the load point during power down. The oscillator buffer is disabled when the ENosc pin is set LOW. The OSCin pin is forced to a HIGH state through an approximate 100-kΩ resistance when this condition exists. When either synthesizer is activated, the respective prescaler, phase detector, charge-pump circuit, and the oscillator buffer are all powered up. The feedback divider and

## Device Functional Modes (continued)

reference divider are held at their load point. This allows the reference oscillator, feedback divider, reference divider, and prescaler circuitry to reach proper bias levels. After a finite delay, the feedback and reference dividers are enabled and resume counting in close alignment (the maximum error is one prescaler cycle). The MICROWIRE control register remains active and capable of loading and latching data while in power-down mode.

### 9.4.1.1 Synchronous Power-Down Mode

In this mode, the power-down function is gated by the charge pump. When the device is configured for synchronous power down, the device enters the power-down mode upon completion of the next charge-pump pulse event.

### 9.4.1.2 Asynchronous Power-Down Mode

In the asynchronous power-down mode, the power-down function is NOT gated by the completion of a charge-pump pulse event. When the device is configured for asynchronous power down, the part goes into power-down mode immediately.

**Table 7. Power-Down Modes**

EN PIN	RF_CPT / IF_CPT BIT	RF_PD / IF_PD BIT	OPERATING MODE
0	X <sup>(1)</sup>	X <sup>(1)</sup>	Asynchronous Power Down
1	0	0	PLL Active. Normal Operation
1	1	0	PLL Active. Charge-Pump Output in High-Impedance State
1	0	1	Synchronous Power Down
1	1	1	Asynchronous Power Down

(1) X refers to a don't care condition.

## 9.5 Programming

### 9.5.1 Microwire Interface

The 24-bit shift register is loaded through the MICROWIRE interface. The shift register consists of a 21-bit *DATA[20:0] FIELD* and a 3-bit *ADDRESS[2:0] FIELD* as shown in [Table 8](#). The ADDRESS FIELD is used to decode the internal control register address. When LE transitions HIGH, DATA stored in the shift register is loaded into one of 6 control registers depending on the state of the ADDRESS bits. The MSB of DATA is loaded into the shift register first. The DATA FIELD assignments are shown in [Control Register Content Map](#).

**Table 8. Register Structure**

MSB			LSB
	DATA[20:0]	ADDRESS[2:0]	
23		3 2	0

## 9.5.2 Control Register Location

The ADDRESS[2:0] bits decode the internal register address. The [Table 9](#) shows how the ADDRESS bits are mapped into the target control register.

**Table 9. Control Register Locations**

ADDRESS[2:0] FIELD			TARGET REGISTER
0	0	0	R0
0	0	1	R1
0	1	0	R2
0	1	1	R3
1	0	0	R4
1	0	1	R5

## 9.6 Register Maps

### 9.6.1 Control Register Content Map

The control register content map describes how the bits within each control register are allocated to specific control functions. The bits that are marked 0 must be programmed as such to ensure proper device operation.

**Table 10. Control Register Content Map**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[20:0] FIELD																						ADDRESS [2:0] FIELD	
R0	MUX[3:2]		RF RS T	RF CP T	RF CP G	RF CP P	RF_R[14:0]															0	0	0
R1	RF PD	RF P	LMX2430/33 RF_B[14:0]													LMX2430/33 RF_A[3:0]			0	0	1			
R1	RF PD	RF P	LMX2434 RF_B[13:0]													LMX2434 RF_A[4:0]			0	0	1			
R2	0	0	0	0	0	0	0	0	0	0	RF_TOC[11:0]											0	1	0

R5	0	0	0	0	0	0	0	0	0	0	IF_TOC[11:0]											1	0	1

### 9.6.2 R0 Register

The R0 register contains the RF\_R, RF\_CPP, RF\_CPG, RF\_CPT, and RF\_RST control words, in addition to two of the four bits that compose the MUX control word. The detailed descriptions and programming information for each control word is discussed in the following sections.

**Table 11. R0 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	DATA[20:0] FIELD																					ADDRESS [2:0] FIELD			
R0	MUX[3:2]			RF RS T	RF CP T	RF CP G	RF CP P	RF_R[14:0]															0	0	0

#### 9.6.2.1 RF\_R[14:0] - RF Synthesizer Programmable Reference Divider (R Counter) (R0[17:3])

The RF reference divider (RF\_R) can be programmed to support divide ratios from 3 to 32,767. Divide ratios less than 3 are prohibited.

**Table 12. PLL R Divider**

DIVIDE RATIO	RF_R[14:0]															
	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
4	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•
32767	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

#### 9.6.2.2 RF\_CPP - RF Synthesizer Phase Detector Polarity (R0[18])

The RF\_CPP bit is used to control the PFD polarity of the RF synthesizer based on the VCO tuning characteristics.

**Table 13. Phase Detector Polarity**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_CPP	R0[18]	RF Phase and Frequency Detector Polarity	RF VCO Negative Tuning Characteristics	RF VCO Positive Tuning Characteristics

**Figure 31. RF VCO Characteristics**

### 9.6.2.3 RF\_CPG - RF Synthesizer Charge-Pump Current Gain (R0[19])

The RF\_CPG bit controls the charge-pump gain of the RF synthesizer. Two gain levels are available.

**Table 14. Charge-Pump Polarity**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_CPG	R0[19]	RF Charge-Pump Current Gain	LOW 1 mA	HIGH 4 mA

### 9.6.2.4 RF\_CPT - RF Synthesizer Charge-Pump Tri-State (R0[20])

The RF\_CPT bit allows the charge pump to be switched between a normal operating mode and a high-impedance output state. This happens asynchronously with the change in the RF\_CPT bit.

Furthermore, the RF\_CPT bit operates in conjunction with the RF\_PD bit to set a synchronous or an asynchronous power-down mode. Refer to [RF\\_PD - RF Synthesizer Power Down \(R1\[23\]\)](#) for more details on how to program the RF\_PD bit.

**Table 15. Charge-Pump Tri-State**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_CPT	R0[20]	RF Charge-Pump tri-state	RF Charge Pump Normal Operation	RF Charge-Pump Output in High Impedance State

### 9.6.2.5 RF\_RST - RF Synthesizer Counter Reset (R0[21])

The RF\_RST bit resets the RF\_A, RF\_B and RF\_R counters. After removing the reset, the RF\_A and RF\_B counters resume counting in close alignment with the RF\_R counter. The maximum error is one prescaler cycle.

**Table 16. N Counter Reset**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_RST	R0[21]	RF Counter Reset	RF_A, RF_B and RF_R Normal Operation	RF_A, RF_B and RF_R Reset

## 9.6.3 R1 Register

The R1 register contains the RF\_A, RF\_B, RF\_P, and RF\_PD control words. The RF\_A and RF\_B control words are used to set up the programmable feedback divider. The detailed descriptions and programming information for each control word is discussed in the following sections.

**Table 17. R1 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	DATA[20:0] FIELD																						ADDRESS [2:0] FIELD		
R1	RF _PD	RF _P	LMX2430/33 RF_B[14:0]																	LMX2430/33 RF_A[3:0]			0	0	1
R1	RF _PD	RF _P	LMX2434 RF_B[13:0]																	LMX2434 RF_A[4:0]			0	0	1

### 9.6.3.1 LMX243x RF Synthesizer Swallow Counter

#### 9.6.3.1.1 RF\_A[3:0] - LMX2430/33 RF Synthesizer Swallow Counter (A Counter) (R1[6:3])

The RF\_A control word is used to set up the A counter of the RF synthesizer. For both the LMX2430 and LMX2433, the A counter is a 4-bit swallow counter used in the programmable feedback divider. The RF\_A control word can be programmed to values ranging from 0 to 15.

**Table 18. RF\_A Divider for LMX2430/33**

DIVIDE RATIO	LMX2430/33 RF_A[3:0]			
	3	2	1	0
0	0	0	0	0
1	0	0	0	1
•	•	•	•	•
15	1	1	1	1

#### 9.6.3.1.2 RF\_A[4:0] - LMX2434 RF Synthesizer Swallow Counter (A Counter) (R1[7:3])

The LMX2434 A counter is a 5-bit swallow counter used in the programmable feedback divider. The RF\_A control word can be programmed to values ranging from 0 to 31.

**Table 19. RF A Divider for LMX2434**

DIVIDE RATIO	LMX2434 RF_A[4:0]				
	4	3	2	1	0
0	0	0	0	0	0
1	0	0	0	0	1
•	•	•	•	•	•
31	1	1	1	1	1

### 9.6.3.2 LMX243x RF Synthesizer Programmable Binary Counter

#### 9.6.3.2.1 RF\_B[14:0] - LMX2430/33 RF Synthesizer Programmable Binary Counter (B Counter) (R1[21:7])

The RF\_B control word is used to set up the B counter of the RF synthesizer. For both the LMX2430 and LMX2433, the B counter is a 15-bit programmable binary counter used in the programmable feedback divider. The RF\_B control word can be programmed to values ranging from 3 to 32,767. Divide ratios less than 3 are prohibited.

**Table 20. RF B Divider for LMX2430/33**

DIVIDE RATIO	LMX2430/33 RF_B[14:0]														
	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
4	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•
32767	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

#### 9.6.3.2.2 RF\_B[13:0] - LMX2434 RF Synthesizer Programmable Binary Counter (B Counter) (R1[21:8])

The LMX2434 B counter is a 14-bit programmable binary counter used in the programmable feedback divider. The RF\_B control word can be programmed to values ranging from 3 to 16,383. Divide ratios less than 3 are prohibited.

**Table 21. RF B Divider for LMX2434**

DIVIDE RATIO	LMX2434 RF_B[13:0]													
	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3	0	0	0	0	0	0	0	0	0	0	0	0	1	1
4	0	0	0	0	0	0	0	0	0	0	0	1	0	0
•	•	•	•	•	•	•	•	•	•	•	•	•	•	•
16383	1	1	1	1	1	1	1	1	1	1	1	1	1	1

### 9.6.3.3 LMX243x RF Synthesizer Prescaler Select

#### 9.6.3.3.1 RF\_P - LMX2430/33 RF Synthesizer Prescaler Select (R1[22])

Both the LMX2430 and LMX2433 RF synthesizers use a selectable dual-modulus prescaler. An 8/9 or a 16/17 prescale ratio can be selected.

**Table 22. Prescaler Select Bit for LMX2430/33**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_P	R1[22]	LMX2430/33 RF Prescaler Select	8/9 Prescaler Selected	16/17 Prescaler Selected

#### 9.6.3.3.2 RF\_P - LMX2434 RF Synthesizer Prescaler Select (R1[22])

The LMX2434 RF synthesizer uses a selectable dual-modulus prescaler. A 16/17 or a 32/33 prescale ratio can be selected.

**Table 23. Prescaler Select Bit for LMX2434**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_P	R1[22]	LMX2434 RF Prescaler Select	16/17 Prescaler Selected	32/33 Prescaler Selected

### 9.6.3.4 RF\_PD - RF Synthesizer Power Down (R1[23])

The RF\_PD bit is used to switch the RF PLL between a powered-up and powered-down mode.

Furthermore, the RF\_PD bit operates in conjunction with the RF\_CPT bit to set a synchronous or an asynchronous power-down mode. Refer to [RF\\_CPT - RF Synthesizer Charge-Pump Tri-State \(R0\[20\]\)](#) for more details on how to program the RF\_CPT bit.

**Table 24. Power Down Bit**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
RF_PD	R1[23]	RF Power down	RF PLL Active	RF PLL Power down

### 9.6.4 R2 Register

The R2 Register contains the RF\_TOC control word. The RF\_TOC is used to set up the fastlock circuitry of the RF synthesizer. The RF\_TOC is a 12-bit binary counter programmable from 0 to 4095.

**Table 25. R2 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	DATA[20:0] FIELD																						ADDRESS [2:0] FIELD		
R2	0	0	0	0	0	0	0	0	0	0	RF_TOC[11:0]												0	1	0

### 9.6.4.1 RF\_TOC[0:11] - RF Synthesizer Time-Out Counter (R2[14:3])

The FLoutRF pin can be configured as a general-purpose CMOS tri-state output or as a fastlock output by programming the RF\_TOC appropriately. When the RF\_TOC is programmed from 0 to 3, automatic fastlock is disabled, and the FLoutRF pin is either configured as a general-purpose CMOS tri-state output or manual fastlock is enabled. When the RF\_TOC is programmed to 0, the FLoutRF pin is in tri-state (high impedance) mode. The charge-pump current is then the value specified by RF\_CPG (R0[19]). When the RF\_TOC is programmed to 1, the FLoutRF pin is pulled to a LOW state. The charge-pump current is then set to a HIGH gain state (RF\_CPG bit = 1). This condition is known as the manual fastlock. When the RF\_TOC is programmed to 2, the FLoutRF pin is again pulled to a LOW state, but this time the charge-pump current is the value specified by RF\_CPG (R0[19]). When the RF\_TOC is programmed to 3, the FLoutRF pin is pulled to a HIGH state. Again, the charge-pump current is the value specified by RF\_CPG (R0[19]). When the RF\_TOC is programmed from 4 to 4095, fastlock is enabled, and the FLoutRF pin is pulled to a LOW state. Fastlock time outs after the specified number of PFD events. At this time, the FLoutRF pin switches to tri-state (high impedance) mode. The value programmed into RF\_TOC represents the number of PFD events that the RF synthesizer spends in the fastlock state.

#### NOTE

Any write to the RF\_TOC requires a PFD event on the RF synthesizer to latch the contents. This means that writes to the RF\_TOC take effect synchronously with the next PFD event.

**Table 26. Fastlock Time-Out Counter**

RF_TOC[11:0]	FASTLOCK MODE	FASTLOCK PERIOD [PFD EVENTS]	FLoutRF PIN FUNCTIONALITY / STATE	I <sub>CPoutRF</sub> MAGNITUDE
0	Disabled	N/A	General-Purpose. High Impedance State	I <sub>CPoutRF</sub> magnitude controlled by R0[19]
1	Enabled Manual Fastlock	N/A	General-Purpose. Logic LOW State	I <sub>CPoutRF</sub> = 4 mA
2	Disabled	N/A	General-Purpose. Logic LOW State	I <sub>CPoutRF</sub> magnitude controlled by R0[19]
3	Disabled	N/A	General-Purpose. Logic HIGH State	I <sub>CPoutRF</sub> magnitude controlled by R0[19]
4	Enabled Automatic Fastlock	4	FastLock. Logic LOW State. Switches to High Impedance after 4 PFD events	I <sub>CPoutRF</sub> = 4 mA Switches to 1 mA after 4 PFD events
...	...	...	...	...
4095	Enabled Automatic Fastlock	4095	FastLock. Logic LOW State. Switches to High Impedance after 4095 PFD events	I <sub>CPoutRF</sub> = 4 mA Switches to 1 mA after 4095 PFD events

### 9.6.4.2 R3 Register

The R3 register contains the IF\_R, IF\_CPP, IF\_CPG, IF\_CPT, and IF\_RST control words, in addition to two of the four bits that compose the MUX control word. The detailed descriptions and programming information for each control word is discussed in the following sections.

**Table 27. R3 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[20:0] FIELD																					ADDRESS [2:0] FIELD		
R3	MUX[1:0]		IF_RS T	IF_CP T	IF_CP G	IF_CP P	IF_R[14:0]															0	1	1

**9.6.4.2.1 IF\_R[14:0] - IF Synthesizer Programmable Reference Divider (R Counter) (R3[17:3])**

The IF reference divider (IF\_R) can be programmed to support divide ratios from 3 to 32,767. Divide ratios less than 3 are prohibited.

**Table 28. IF R Divider**

DIVIDE RATIO	IF_R[14:0]														
	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
4	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•
32767	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

**9.6.4.2.2 IF\_CPP - IF Synthesizer Phase Detector Polarity (R3[18])**

The IF\_CPP bit is used to control the PFD polarity of the IF synthesizer based on the VCO tuning characteristics.

**Table 29. IF PLL Charge-Pump Polarity**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_CPP	R3[18]	IF PFD Polarity	IF VCO Negative Tuning Characteristics	IF VCO Positive Tuning Characteristics

**Figure 32. IF VCO Characteristics**
**9.6.4.2.3 IF\_CPG - IF Synthesizer Charge-Pump Current Gain (R3[19])**

The IF\_CPG bit controls the charge-pump gain of the IF synthesizer. Two gain levels are available.

**Table 30. IF PLL Phase Detector Polarity Bit**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_CPG	R3[19]	IF Charge-Pump Current Gain	LOW 1 mA	HIGH 4 mA

**9.6.4.2.4 IF\_CPT - IF Synthesizer Charge-Pump Tri-State (R3[20])**

The IF\_CPT bit allows the charge pump to be switched between a normal operating mode and a high impedance output state. This happens asynchronously with the change in the IF\_CPT bit.

Furthermore, the IF\_CPT bit operates in conjunction with the IF\_PD bit to set a synchronous or an asynchronous power-down mode. Refer to [IF\\_PD - IF Synthesizer Power Down \(R4\[23\]\)](#) for more details on how to program the IF\_PD bit.

**Table 31. IF PLL Charge-Pump Polarity Bit**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_CPT	R3[20]	IF Charge-Pump Tri-State	IF Charge Pump Normal Operation	IF Charge-Pump Output in High Impedance State

#### 9.6.4.2.5 IF\_RST - IF Synthesizer Counter Reset (R3[21])

The IF\_RST bit resets of the IF\_A, IF\_B and IF\_R counters. After removing the reset, the IF\_A and IF\_B counters resume counting in close alignment with the IF\_R counter. The maximum error is one prescaler cycle.

**Table 32. IF PLL Counter Reset**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_RST	R3[21]	IF Counter Reset	IF_A, IF_B and IF_R Normal Operation	IF_A, IF_B and IF_R Reset

#### 9.6.5 R4 Register

The R4 register contains the IF\_A, IF\_B, IF\_P, and IF\_PD control words. The IF\_A and IF\_B control words are used to set up the programmable feedback divider. The detailed descriptions and programming information for each control word is discussed in the following sections. R4[21] is always set to 0.

**Table 33. R4 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### 9.6.5.1 IF\_A[3:0] - IF Synthesizer Swallow Counter (A Counter) (R4[6:3])

The IF\_A control word is used to set up the A counter of the IF synthesizer. The A counter is a 4-bit swallow counter used in the programmable feedback divider. The IF\_A control word can be programmed to values ranging from 0 to 15.

**Table 34. IF A counter Bit**

DIVIDE RATIO	IF_A[3:0]			
	3	2	1	0
0	0	0	0	0
1	0	0	0	1
•	•	•	•	•
15	1	1	1	1

#### 9.6.5.2 IF\_B[13:0] - IF Synthesizer Programmable Binary Counter (B Counter) (R4[20:7])

The IF\_B control word is used to set up the B counter of the IF synthesizer. The B counter is a 14-bit programmable binary counter used in the programmable feedback divider. The IF\_B control word can be programmed to values ranging from 3 to 16,383. Divide ratios less than 3 are prohibited.

**Table 35. IF B Counter**

DIVIDE RATIO	IF_B[13:0]													
	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3	0	0	0	0	0	0	0	0	0	0	0	0	1	1

•	•	•	•	•	•	•	•	•	•	•	•	•	•	•
16383	1	1	1	1	1	1	1	1	1	1	1	1	1	1

**9.6.5.2.1 IF\_P - IF Synthesizer Prescaler Select (R4[22])**

The LMX243x IF synthesizer uses a selectable dual modulus prescaler. An 8/9 or a 16/17 prescale ratio can be selected.

**Table 36. IF Prescaler Select Bit**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_P	R4[22]	IF Prescaler Select	8/9 Prescaler Selected	16/17 Prescaler Selected

**9.6.5.3 IF\_PD - IF Synthesizer Power Down (R4[23])**

The IF\_PD bit is used to switch the IF PLL between a powered-up and powered-down mode.

Furthermore, the IF\_PD bit operates in conjunction with the IF\_CPT bit to set a synchronous or an asynchronous power-down mode. Refer to [IF\\_CPT - IF Synthesizer Charge-Pump Tri-State \(R3\[20\]\)](#) for more details on how to program the IF\_CPT bit.

**Table 37. IF PLL Powerdown Bit**

CONTROL BIT	REGISTER LOCATION	DESCRIPTION	FUNCTION	
			0	1
IF_PD	R4[23]	IF Power down	IF PLL Active	IF PLL Power down

**9.6.6 R5 Register**

The R5 Register contains the IF\_TOC control word. The IF\_TOC is used to set up the fastlock circuitry of the IF synthesizer. The IF\_TOC is a 12-bit binary counter programmable from 0 to 4095.

**Table 38. R5 Register**

REG	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[20:0] FIELD																					ADDRESS [2:0] FIELD		
R5	0	0	0	0	0	0	0	0	0	IF_TOC[11:0]												1	0	1

### 9.6.6.1 IF\_TOC[0:11] - IF Synthesizer Time-Out Counter (R5[14:3])

The OSCout/ FLoutIF pin can be configured as a general-purpose CMOS tri-state output or as a fastlock output by programming the IF\_TOC appropriately. When the IF\_TOC is programmed from 0 to 3, automatic fastlock is disabled, and the OSCout/ FLoutIF pin is configured as a general-purpose CMOS tri-state output or manual fastlock is enabled. When the IF\_TOC is programmed to 0, the OSCout/ FLoutIF pin is in tri-state (high impedance) mode. The charge-pump current is then the value specified by IF\_CPG (R3[19]). When the IF\_TOC is programmed to 1, the OSCout/ FLoutIF pin is pulled to a LOW state. The charge-pump current is then set to a HIGH gain state (IF\_CPG bit = 1). This condition is known as the manual fastlock. When the IF\_TOC is programmed to 2, the OSCout/ FLoutIF pin is again pulled to a LOW state, but this time the charge-pump current is the value specified by IF\_CPG (R3[19]). When the IF\_TOC is programmed to 3, the OSCout/ FLoutIF pin is pulled to a HIGH state. Again, the charge-pump current is the value specified by IF\_CPG (R3[19]). When the IF\_TOC is programmed from 4 to 4095, fastlock is enabled, and the OSCout/ FLoutIF pin is pulled to a LOW state. Fastlock timeouts after the specified number of PFD events. At this time, the OSCout/ FLoutIF pin switches to tri-state (high impedance) mode. The value programmed into IF\_TOC represents the number of PFD events that the IF synthesizer spends in the fastlock state.

#### NOTE

Any write to the IF\_TOC requires a PFD event on the IF synthesizer to latch the contents. This means that writes to the IF\_TOC take effect synchronously with the next PFD event.

**Table 39. IF PLL Fastlock Time-Out Counter**

IF_TOC[11:0]	FASTLOCK MODE	FASTLOCK PERIOD [PFD Events]	OSCout/ FLoutIF PIN FUNCTIONALITY / STATE	I <sub>CPoutIF</sub> MAGNITUDE
0	Disabled	N/A	General-Purpose. High Impedance State	I <sub>CPoutIF</sub> magnitude controlled by R3[19]
1	Enabled Manual Fastlock	N/A	General-Purpose. Logic LOW State	I <sub>CPoutIF</sub> = 4 mA
2	Disabled	N/A	General-Purpose. Logic LOW State	I <sub>CPoutIF</sub> magnitude controlled by R3[19]
3	Disabled	N/A	General-Purpose. Logic HIGH State	I <sub>CPoutIF</sub> magnitude controlled by R3[19]
4	Enabled Automatic Fastlock	4	FastLock. Logic LOW State. Switches to High Impedance after 4 PFD events	I <sub>CPoutIF</sub> = 4 mA Switches to 1 mA after 4 PFD events
...	...	...	...	...
4095	Enabled Automatic Fastlock	4095	FastLock. Logic LOW State. Switches to High Impedance after 4095 PFD events	I <sub>CPoutIF</sub> = 4 mA Switches to 1 mA after 4095 PFD events

**9.6.7 MUX[3:0] - Multifunction Output Select (R3[23:22]:R0[23:22])**

The MUX control word is used to determine which signal is routed to the Ftest/LD pin.

**Table 40. Multifunction Output Select<sup>(1)</sup>**

MUX[3:0]				MUX OUTPUT STATE
0	0	0	0	High Impedance (Tri-state) State Output
0	0	0	1	Logic HIGH State Output
0	0	1	0	Logic LOW State Output
0	0	1	1	RF PLL and IF PLL Digital Lock Detect. Open-Drain Output
0	1	0	0	RF PLL Digital Lock Detect. Open-Drain Output
0	1	0	1	IF PLL Digital Lock Detect. Open-Drain Output
0	1	1	0	RF PLL and IF PLL Analog Lock Detect. Open-Drain Output
0	1	1	1	RF PLL Analog Lock Detect. Open-Drain Output
1	0	0	0	IF PLL Analog Lock Detect. Open-Drain Output
1	0	0	1	RF PLL and IF PLL Analog Lock Detect. Push-Pull Output
1	0	1	0	RF PLL Analog Lock Detect. Push-Pull Output
1	0	1	1	IF PLL Analog Lock Detect. Push-Pull Output
1	1	0	0	IF_R/ 2 Frequency
1	1	0	1	IF_N/ 2 Frequency
1	1	1	0	RF_R/ 2 Frequency
1	1	1	1	RF_N/ 2 Frequency

- (1) 1.  $RF\_N = (RF\_B \times RF\_P) + RF\_A$   
 2.  $IF\_N = (IF\_B \times IF\_P) + IF\_A$

## 10 Application and Implementation

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

### 10.1 Application Information

The LMX2430 family of devices can be used in a broad class of applications. LMX2430x devices have very low current consumption and are well-suited for many lower power applications. Because these devices have two PLLs, they can be used to generate two distinct frequencies. However, it is a perfectly valid thing to only use one of the PLLs and power down the other side. When only one side is used, be sure to power the other side down, but do NOT disconnect the power pins for the unused side as they are shared across several internal blocks. When the unused side is powered down, it draws no current, and the counters and charge pump are not running or generating any noise and spurs. [Figure 33](#) generally applies to most applications.

LMX2430, LMX2433, LMX2434

SNAS187D – FEBRUARY 2003 – REVISED JANUARY 2016

10.2 Typical Application

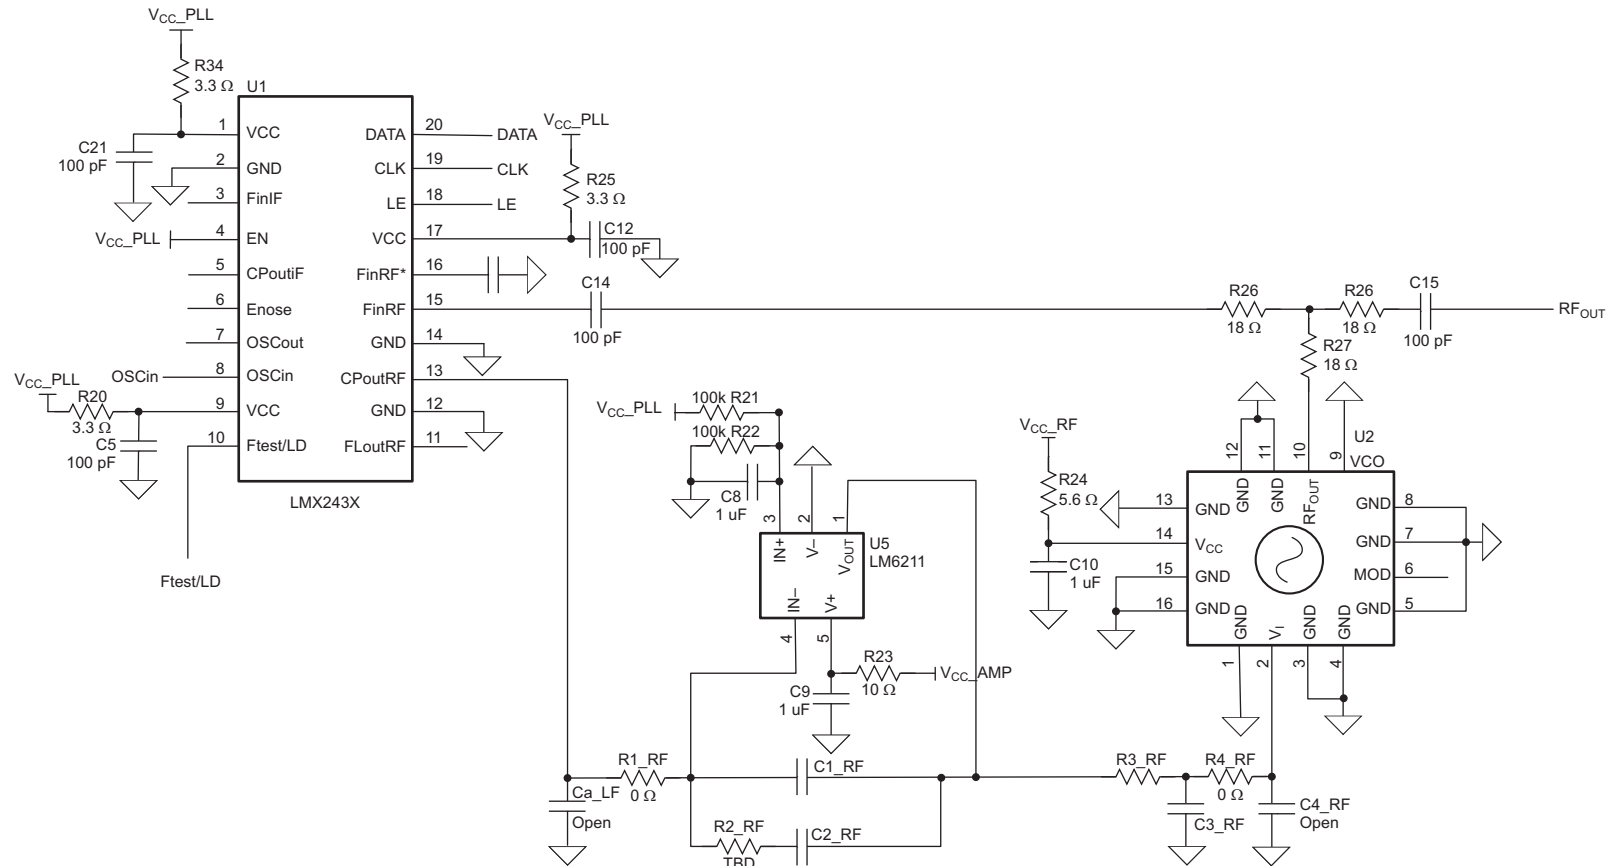

Figure 33. Typical Use Case

### 10.2.1 Design Requirements

Table 41 lists the design parameters of the LMX243x.

**Table 41. Design Parameters**

PARAMETER		VALUE
K <sub>PD</sub>	Charge-Pump Gain	4 mA
C <sub>VCO</sub>	VCO Input Capacitance	22 pF
f <sub>PD</sub>	Phase Detector Frequency	1 MHz
f <sub>OSC</sub>	OSCin Frequency	100 MHz
BW	Loop Bandwidth	31.1 kHz
PM	Phase Margin	59.6 degrees
Gamma	Gamma	0.9
T3/T1	T3/T1 Ratio	177.1%
C1_RF	Loop Filter Components	270 pF
C2_RF		10 nF
C3_RF		1 nF
C4_RF		Open
R2_RF		1.8 Ω
R3_RF		820 Ω
R4_RF		0 Ω

### 10.2.2 Detailed Design Procedure

The loop filter design is key and involves trade-offs between lock time, phase noise, and spurs. The TI website has references and design and simulation tools that can be used to design the loop filter and simulate the performance.

### 10.2.3 Application Curves

## 11 Power Supply Recommendations

Low-noise regulators are generally recommended for the supply pins. It is acceptable to have one regulator supply the part, although it is best to implement individual bypassing as shown in the [Layout Guidelines](#) for the best spur performance. The charge-pump pins are typically the most sensitive to supply noise, but the external VCO used with this device is likely to be orders of magnitude more sensitive.

## 12 Layout

### 12.1 Layout Guidelines

In general, there are two cases for layout:

1. *Use as a single PLL:* In this case, all power supply pins must be connected, but for those on the unused PLL, bypassing is not necessary, and they can be shorted together. Leave unused outputs unconnected, and do not ground them.
2. *Use as a dual PLL:* In this case, supply coupling is much more critical as there can be crosstalk between the two PLLs. There must be isolation in the form of resistors or inductors between the charge-pump supply pins, and decoupling capacitors are more important.

### 12.2 Layout Example

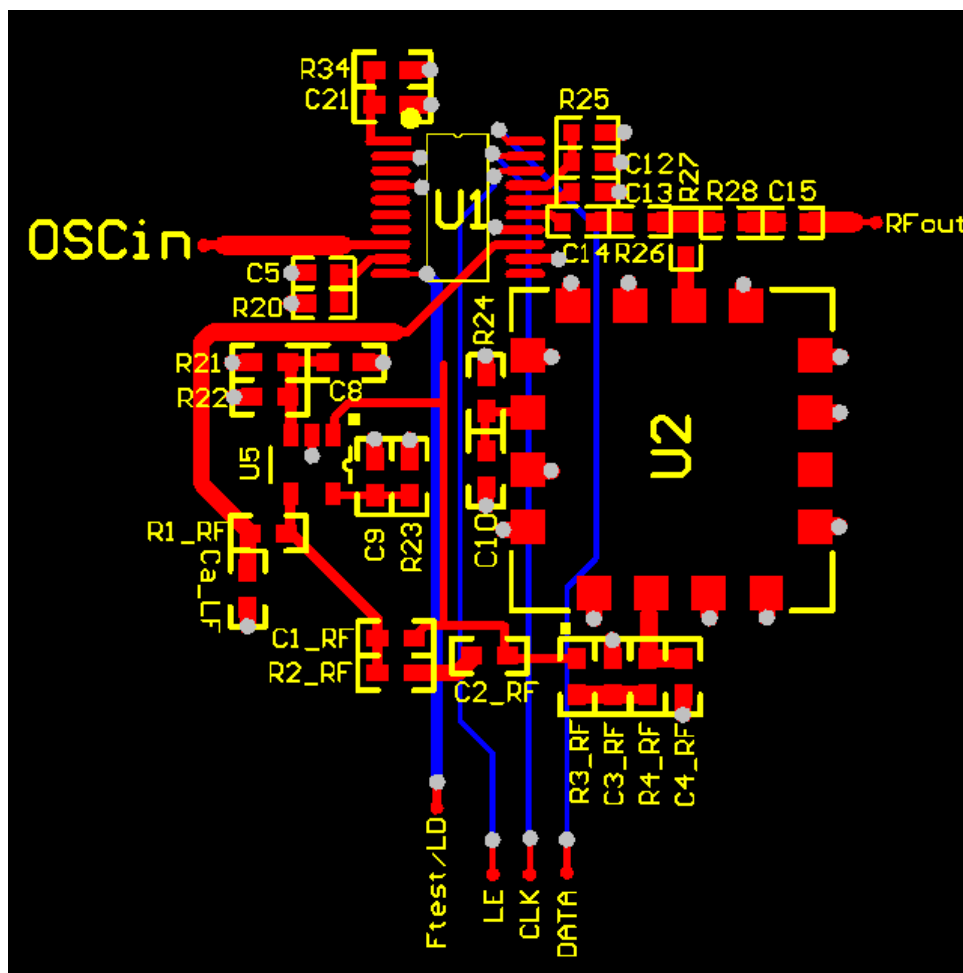

Figure 36. Layout Example

## 13 Device and Documentation Support

### 13.1 Device Support

#### 13.1.1 Device Nomenclature

##### 13.1.1.1 List of Definitions

- f<sub>COMP</sub>:** RF or IF phase detector comparison frequency
- Fin:** RF or IF input frequency
- A:** RF\_A or IF\_A counter value
- B:** RF\_B or IF\_B counter value
- P:** Preset modulus of the dual modulus prescaler  
 LMX2430 RF synthesizer: P = 8 or 16  
 LMX2433 RF synthesizer: P = 8 or 16  
 LMX2434 RF synthesizer: P = 16 or 32  
 LMX243x IF synthesizer: P = 8 or 16

### 13.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

### 13.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 13.4 Trademarks

PLLatinum, E2E are trademarks of Texas Instruments.  
 All other trademarks are the property of their respective owners.

### 13.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 13.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

LMX2434SLEX/NOPB	ACTIVE	ULGA	NPE	20	2500	Green (RoHS & no Sb/Br)	NIAU	Level-1-260C-UNLIM	-40 to 85	X2434 SLE	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
