

**THE DATASHEET OF
ADG451BRZ-REEL7**

ADG451/ADG452/ADG453
FEATURES

- Low on resistance (4 Ω)**
- On resistance flatness (0.2 Ω)**
- 44 V supply maximum ratings**
- ±15 V analog signal range**
- Fully specified at ±5 V, 12 V, ±15 V**
- Ultralow power dissipation (18 μW)**
- ESD 2 kV**
- Continuous current (100 mA)**
- Fast switching times**
- t_{ON} 70 ns**
- t_{OFF} 60 ns**
- TTL-/CMOS-compatible**
- Pin-compatible upgrade for ADG411/ADG412/ADG413 and ADG431/ADG432/ADG433**

APPLICATIONS

- Relay replacement**
- Audio and video switching**
- Automatic test equipment**
- Precision data acquisition**
- Battery-powered systems**
- Sample-and-hold systems**
- Communication systems**
- PBX, PABX systems**
- Avionics**

GENERAL DESCRIPTION

The ADG451/ADG452/ADG453 are monolithic CMOS devices comprising four independently selectable switches. They are designed on an enhanced LC²MOS process that provides low power dissipation yet gives high switching speed and low on resistance.

The on resistance profile is very flat over the full analog input range, ensuring excellent linearity and low distortion when switching audio signals. Fast switching speed, coupled with high signal bandwidth, makes the parts suitable for video signal switching. CMOS construction ensures ultralow power dissipation, making the parts ideally suited for portable and battery-powered instruments.

The ADG451/ADG452/ADG453 contain four independent, single-pole/single-throw (SPST) switches. The ADG451 and ADG452 differ only in that the digital control logic is inverted. The ADG451 switches are turned on with a logic low on the appropriate control input, while a logic high is required for the ADG452.

Figure 2. ADG452

05239-101

SWITCHES SHOWN FOR A LOGIC 1 INPUT.

Figure 3. ADG453

05239-102

The ADG453 has two switches with digital control logic similar to that of the ADG451, while the logic is inverted on the other two switches.

Each switch conducts equally well in both directions when on, and each has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked.

The ADG453 exhibits break-before-make switching action for use in multiplexer applications. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

PRODUCT HIGHLIGHTS

1. Low R_{ON} (5 Ω maximum).
2. Ultralow Power Dissipation.
3. Extended Signal Range.
The ADG451/ADG452/ADG453 are fabricated on an enhanced LC²MOS process, giving an increased signal range that fully extends to the supply rails.
4. Break-Before-Make Switching.
This prevents channel shorting when the switches are configured as a multiplexer (ADG453 only.)
5. Single-Supply Operation.
For applications in which the analog signal is unipolar, the ADG451/ADG452/ADG453 can be operated from a single rail power supply. The parts are fully specified with a single 12 V power supply and remain functional with single supplies as low as 5.0 V.
6. Dual-Supply Operation.
For applications where the analog signal is bipolar, the ADG451/ADG452/ADG453 can be operated from a dual power supply ranging from ± 4.5 V to ± 20 V.

ADG451/ADG452/ADG453

SPECIFICATIONS

15 V DUAL SUPPLY

$V_{DD} = 15\text{ V}$, $V_{SS} = -15\text{ V}$, $V_L = 5\text{ V}$, $GND = 0\text{ V}$. All specifications T_{MIN} to T_{MAX} , unless otherwise noted.

Table 1.

Parameter	B Version ¹		Unit	Test Conditions/Comments

ESD	2 kV

¹ Overvoltages at IN, S, or D are clamped by internal diodes. Current should be limited to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating may be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TERMINOLOGY

R_{ON}

Ohmic resistance between D and S.

ΔR_{ON}

On resistance match between any two channels, that is, R_{ON} maximum minus R_{ON} minimum.

$R_{FLAT(ON)}$

Flatness is defined as the difference between the maximum and minimum value of on resistance, as measured over the specified analog signal range.

I_S (OFF)

Source leakage current with the switch off.

I_D (OFF)

Drain leakage current with the switch off.

I_D, I_S (ON)

Channel leakage current with the switch on.

V_D (V_S)

Analog voltage on Terminal D and Terminal S.

C_S (OFF)

Off switch source capacitance.

C_D (OFF)

Off switch drain capacitance.

C_D (ON), C_S (ON)

On switch capacitance.

t_{ON}

Delay between applying the digital control input and the output switching on. See Figure 19.

t_{OFF}

Delay between applying the digital control input and the output switching off.

t_D

Off time or on time measured between the 90% points of both switches, when switching from one address state to another. See Figure 20.

Crosstalk

A measure of unwanted signal coupled through from one channel to another as a result of parasitic capacitance.

Off Isolation

A measure of unwanted signal coupling through an off switch.

Charge Injection

A measure of the glitch impulse transferred from the digital input to the analog output during switching.

APPLICATIONS

Figure 15 illustrates a precise, fast, sample-and-hold circuit. An [AD845](#) is used as the input buffer, and the output operational amplifier is an [AD711](#). During track mode, SW1 is closed, and the output, V_{OUT} , follows the input signal, V_{IN} . In hold mode, SW1 is opened, and the signal is held by the hold capacitor, C_H .

Figure 15. Fast, Accurate Sample-and-Hold Circuit

05239-013

Due to switch and capacitor leakage, the voltage on the hold capacitor decreases with time. The ADG451/ADG452/ADG453 minimize this droop due to their low leakage specifications. The droop rate is further minimized by the use of a polystyrene hold capacitor. The droop rate for the circuit shown is typically $30 \mu\text{V}/\mu\text{s}$.

A second switch, SW2, which operates in parallel with SW1, is included in this circuit to reduce pedestal error. Because both switches are at the same potential, they have a differential effect on the op amp, AD711, which minimizes charge injection effects. Pedestal error is also reduced by the compensation network, R_C and C_C . This compensation network reduces the hold time glitch while optimizing the acquisition time. Using the illustrated op amps and component values, the pedestal error has a maximum value of 5 mV over the $\pm 10 \text{ V}$ input range. Both the acquisition and settling times are 850 ns.
