

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Three-PLL General-Purpose EPROM-Programmable Clock Generator

Features

- Three integrated phase locked loops (PLLs)
- Erasable programmable read only memory (EPROM) programmability
- Factory programmable (CY2292) or field programmable (CY2292F) device options
- Low-skew, low-jitter, high accuracy outputs
- Power management options (shutdown, OE, suspend)
- Frequency select option
- Smooth slewing on CPUCLK
- Configurable 3.3 V or 5 V operation
- 16-pin small-outline integrated circuit (SOIC) package (CY2292F also in TSSOP)

Benefits

- Generates up to three custom frequencies from one external source
- Easy customization and fast turnaround
- Programming support available for all opportunities
- Supports low power applications
- Eight user selectable frequencies on CPUPLL
- Allows downstream PLLs to stay locked on CPUCLK output
- Industry standard packaging saves on board space

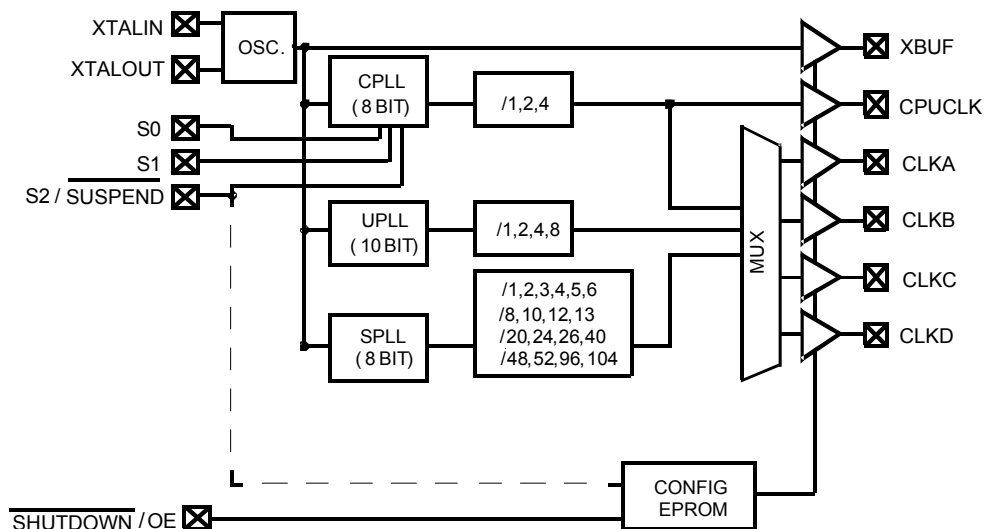

Functional Description

Pinouts

Figure 1. 16-pin SOIC / TSSOP pinout

Pin Definitions

Name	Pin Number	Description
CLKC	1	Configurable clock output C.
V _{DD}	2, 14	Voltage supply.
GND	3, 11	Ground.
XTALIN ^[1]	4	Reference crystal input or external reference clock input.
XTALOUT ^[1, 2]	5	Reference crystal feedback.
XBUF	6	Buffered reference clock output.
CLKD	7	Configurable clock output D.
CPUCLK	8	CPU frequency clock output.
CLKB	9	Configurable clock output B.
CLKA	10	Configurable clock output A.
S0	12	CPU clock select input, bit 0.
S1	13	CPU clock select input, bit 1.
S2/SUSPEND	15	CPU clock select input, bit 2. Optionally enables suspend feature when LOW.
SHUTDOWN/OE	16	Places outputs in tristate ^[3] condition and shuts down chip when LOW. Optionally, only places outputs in tristate ^[3] condition and does not shut down chip when LOW.

Notes

1. For best accuracy, use a parallel-resonant crystal, C_{LOAD} ≈ 17 pF or 18 pF.
2. Float XTALOUT pin if XTALIN is driven by reference clock (as opposed to crystal).
3. The CY2292 has weak pull downs on all outputs. Hence, when a tristate condition is forced on the outputs, the output pins are pulled low.

Operation

The CY2292 is a third-generation family of clock generators. The CY2292 is upwardly compatible with the industry standard ICD2023 and ICD2028 and continues their tradition by providing a high level of customizable features to meet the diverse clock generation needs of modern motherboards and other synchronous systems.

All parts provide a highly configurable set of clocks for PC motherboard applications. Each of the four configurable clock outputs (CLKA–CLKD) can be assigned 1 of 30 frequencies in any combination. Multiple outputs configured for the same or related frequencies have low (less than 500 ps) skew, in effect providing on-chip buffering for heavily loaded signals.

The CY2292 can be configured for either 5 V or 3.3 V operation. The internal ROM tables use EPROM technology, allowing full customization of output frequencies. The reference oscillator is designed for 10 MHz to 25 MHz crystals, providing additional flexibility. No external components are required with this crystal. Alternatively, an external reference clock of frequency between 1 MHz and 30 MHz can be used.

Output Configuration

The CY2292 has four independent frequency sources on-chip. These are the reference oscillator and three PLLs. Each PLL has a specific function. The system PLL (SPLL) provides fixed output frequencies on the configurable outputs. The SPLL offers the most output frequency divider options. The CPU PLL (CPLL) is controlled by the select inputs (S0–S2) to provide eight user-selectable frequencies with smooth slewing between frequencies. The utility PLL (UPLL) provides the most accurate clock. It is often used for miscellaneous frequencies not provided by the other frequency sources.

All configurations are EPROM programmable, providing short sample and production lead times.

Power Saving Features

The SHUTDOWN/OE input tristates the outputs when pulled LOW. If system shutdown is enabled, a LOW on this pin also shuts off the PLLs, counters, the reference oscillator, and all other active components. The resulting current on the V_{DD} pins is less than 50 μA (for commercial temperature or 100 μA for industrial temperature). After leaving shutdown mode, the PLLs have to relock. All outputs have a weak pull down so that the outputs do not float when tristated.^[4]

The S2/SUSPEND input can be configured to shut down a customizable set of outputs and/or PLLs, when LOW. All PLLs and any of the outputs can be shut off in nearly any combination. The only limitation is that if a PLL is shut off, all outputs derived from it must also be shut off. Suspending a PLL shuts off all associated logic, while suspending an output simply forces a tristate condition.

Note

4. The CY2292 has weak pull downs on all outputs. Hence, when a tristate condition is forced on the outputs, the output pins are pulled low.

The CPUCLK can slew (transition) smoothly between 20 MHz and the maximum output frequency (100 MHz at 5 V / 80 MHz at 3.3 V for commercial temperature parts or 90 MHz at 5 V / 66.6 MHz at 3.3 V for industrial temperature and for field-programmed parts). This feature is extremely useful in green applications, where reducing the frequency of operation can result in considerable power savings.

CyClocks Software

CyClocks™ is an easy-to-use application that allows you to configure any one of the EPROM-programmable clocks offered by Cypress. Specify the input frequency, PLL and output frequencies, and different functional options. Note the output frequency ranges in this datasheet when specifying them in CyClocks to ensure that you stay within the limits. CyClocks also has a power calculation feature that allows you to see the power consumption of your specific configuration. CyClocks is a sub application located within the CyberClocks™ software. You can download a copy of CyberClocks for free on the Cypress web site at <http://www.cypress.com>.

Cypress FTG Programmer

The Cypress frequency timing generator (FTG) programmer is a portable programmer designed to custom program our family of EPROM field programmable clock devices. The FTG programmer connects to a PC serial port and allow users of CyClocks software to quickly and easily program any of the CY2291F, CY2292F and CY2907F devices. The ordering code for the Cypress FTG Programmer is CY3670. An adapter, the CY3095, connects to the CY3670 and is required for programming the CY2292F.

Custom Configuration Request Procedure

The CY229x are EPROM-programmable devices that may be configured in the factory or in the field by a Cypress field application engineer (FAE). The output frequencies requested is matched as closely as the internal PLL divider and multiplier options allow. All custom requests must be submitted to your local Cypress FAE or sales representative. The method to use to request custom configurations is:

Use CyClocks software. This software automatically calculates the output frequencies that can be generated by the CY229x devices and provides a print-out of final pinout which can be submitted (in electronic or print format) to your local FAE or sales representative.

When the custom request is processed, you receive a part number with a 3-digit extension (for example, CY2292SC-128) specific to the frequencies and pinout of your device. This is the part number used for samples requests and production orders.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Supply voltage–0.5 V to +7.0 V
 DC input voltage–0.5 V to +7.0 V

Storage temperature –65 °C to +150 °C
 Maximum soldering temperature (10 sec) 260 °C
 Junction temperature 150 °C
 Package power dissipation 750 mW
 Static discharge voltage
 (per MIL-STD-883, method 3015) ≤ 2000 V

Operating Conditions

Parameter ^[5]	Description	Part Numbers	Min	Max	Unit
V _{DD}	Supply voltage, 5.0 V operation	All	4.5	5.5	V
V _{DD}	Supply voltage, 3.3 V operation	All	3.0	3.6	V
T _A	Commercial operating temperature, ambient	CY2292 / CY2292F	0	70	°C
	Industrial operating temperature, ambient	CY2292I / CY2292FI	–40	85	°C
C _{LOAD}	Maximum load capacitance 5.0 V operation	All	–	25	pF
C _{LOAD}	Maximum load capacitance 3.3 V operation	All	–	15	pF
f _{REF}	External reference crystal	All	10.0	25.0	MHz
	External reference clock ^[6, 7, 8]	All	1	30	MHz

Notes

5. Electrical parameters are guaranteed by design with these operating conditions, unless otherwise noted.
6. External input reference clock must have a duty cycle between 40% and 60%, measured at V_{DD} / 2.
7. Refer to white paper “Crystal Oscillator Topics” for information on AC-coupling the external input reference clock.
8. The oscillator circuit is optimized for a crystal reference and for external reference clocks up to 20 MHz. For external reference clocks above 20 MHz, it is recommended that a 150 Ω pull up resistor to V_{DD} be connected to the Xout pin.

Electrical Characteristics

Commercial, 5.0 V

Parameter	Description	Conditions	Min	Typ	Max	Unit
V _{OH}	High level output voltage	I _{OH} = 4.0 mA	2.4	–	–	V
V _{OL}	Low level output voltage	I _{OL} = 4.0 mA	–	–	0.4	V
V _{IH}	High level input voltage ^[9]	Except crystal pins	2.0	–	–	V
V _{IL}	Low level input voltage ^[9]	Except crystal pins	–	–	0.8	V
I _{IH}	Input high current	V _{IN} = V _{DD} – 0.5 V	–	< 1	10	μA
I _{IL}	Input low current	V _{IN} = +0.5 V	–	< 1	10	μA
I _{OZ}	Output leakage current	Tristate outputs	–	–	250	μA
I _{DD}	V _{DD} supply current ^[10] commercial	V _{DD} = V _{DD} max, 5 V operation	–	75	100	mA
I _{DDS}	V _{DD} power supply current in shutdown mode ^[10]	Shutdown active	–	10	50	μA

Electrical Characteristics

Commercial, 3.3 V

Parameter	Description	Conditions	Min	Typ	Max	Unit
V _{OH}	High level output voltage	I _{OH} = 4.0 mA	2.4	–	–	V
V _{OL}	Low level output voltage	I _{OL} = 4.0 mA	–	–	0.4	V
V _{IH}	High level input voltage ^[9]	Except crystal pins	2.0	–	–	V
V _{IL}	Low level input voltage ^[9]	Except crystal pins	–	–	0.8	V
I _{IH}	Input high current	V _{IN} = V _{DD} – 0.5 V	–	< 1	10	μA
I _{IL}	Input low current	V _{IN} = +0.5 V	–	< 1	10	μA
I _{OZ}	Output leakage current	Tristate outputs	–	–	250	μA
I _{DD}	V _{DD} supply current ^[10] commercial	V _{DD} = V _{DD} max, 3.3 V operation	–	50	65	mA
I _{DDS}	V _{DD} power supply current in shutdown mode ^[10]	Shutdown active	–	10	50	μA

Notes

9. Xtal inputs have CMOS thresholds.

 10. Load = Max, V_{IN} = 0 V or V_{DD}. Typical (–104) configuration, CPUCLK = 66 MHz. Other configurations vary. Power can be approximated by the following formula (multiply by 0.65 for 3 V operation): I_{DD} = 10 + 0.06•(F_{CPLL} + F_{UPLL} + 2•F_{SPLL}) + 0.27•(F_{CLKA} + F_{CLKB} + F_{CLKC} + F_{CLKD} + F_{CPULCK} + F_{XBUF}).

Electrical Characteristics

Industrial, 5.0 V

Parameter	Description	Conditions	Min	Typ	Max	Unit
V _{OH}	High level output voltage	I _{OH} = 4.0 mA	2.4	–	–	V
V _{OL}	Low level output voltage	I _{OL} = 4.0 mA	–	–	0.4	V
V _{IH}	High level input voltage ^[11]	Except crystal pins	2.0	–	–	V
V _{IL}	Low level input voltage ^[11]	Except crystal pins	–	–	0.8	V
I _{IH}	Input high current	V _{IN} = V _{DD} – 0.5 V	–	< 1	10	μA
I _{IL}	Input low current	V _{IN} = +0.5 V	–	< 1	10	μA
I _{OZ}	Output leakage current	Tristate outputs	–	–	250	μA
I _{DD}	V _{DD} supply current ^[12] industrial	V _{DD} = V _{DD} max, 5 V operation	–	75	110	mA
I _{DDS}	V _{DD} power supply current in shutdown mode ^[12]	Shutdown active	–	10	100	μA

Electrical Characteristics

Industrial, 3.3 V

Parameter	Description	Conditions	Min	Typ	Max	Unit

Switching Characteristics

Commercial, 5.0 V

Parameter	Name	Description	Min	Typ	Max	Unit
t ₁	Output period	Clock output range, 5 V operation	10 (100 MHz)	–	13000 (76.923 kHz)	ns
			CY2292SC, SXC	–	–	–
			11.1 (90 MHz)	–	13000 (76.923 kHz)	ns
	Output duty cycle ^[13]	Duty cycle for outputs, defined as $t_2 \div t_1$ ^[14] f _{OUT} ≥ 66 MHz	40	50	60	%
		Duty cycle for outputs, defined as $t_2 \div t_1$ ^[14] f _{OUT} < 66 MHz	45	50	55	%
t ₃	Rise time	Output clock rise time ^[15]	–	3	5	ns
t ₄	Fall time	Output clock fall time ^[15]	–	2.5	4	ns
t ₅	Output disable time	Time for output to enter tristate mode after SHUTDOWN/OE goes LOW	–	10	15	ns
t ₆	Output enable time	Time for output to leave tristate mode after SHUTDOWN/OE goes HIGH	–	10	15	ns
t ₇	Skew	Skew delay between any identical or related outputs ^[14, 16]	–	< 0.25	0.5	ns
t ₈	CPUCLK slew	Frequency transition rate	1.0	–	20.0	MHz/ ms
t _{9A}	Clock jitter ^[16]	Peak-to-peak period jitter (t _{9A} max – t _{9A} min), percentage of clock period (f _{OUT} ≤ 4 MHz)	–	< 0.5	1	%
t _{9B}	Clock jitter ^[16]	Peak-to-peak period jitter (t _{9B} max – t _{9B} min) (4 MHz ≤ f _{OUT} ≤ 16 MHz)	–	< 0.7	1	ns
t _{9C}	Clock jitter ^[16]	Peak-to-peak period jitter (16 MHz < f _{OUT} ≤ 50 MHz)	–	< 400	500	ps
t _{9D}	Clock jitter ^[16]	Peak-to-peak period jitter (f _{OUT} > 50 MHz)	–	< 250	350	ps
t _{10A}	Lock time for CPLL	Lock time from power-up	–	< 25	50	ms
t _{10B}	Lock time for UPLL and SPLL	Lock time from power-up	–	< 0.25	1	ms
	Slew limits	CPU PLL slew limits	20	–	100	MHz
			CY2292SC, SXC	–	–	–
			20	–	90	MHz
				–	–	–

Notes

13. XBUF duty cycle depends on XTALIN duty cycle.

14. Measured at 1.4 V.

15. Measured between 0.4 V and 2.4 V.

16. Jitter varies with configuration. All standard configurations sample tested at the factory conform to this limit.

Switching Characteristics

Commercial, 3.3 V

Parameter	Name	Description	Min	Typ	Max	Unit

t _{10B}	Lock time for UPLL and SPLL	Lock time from power-up	–	< 0.25	1	ms	
	Slew limits	CPU PLL slew limits	CY2292SI, SXI	20	–	66.6	MHz
			CY2292FXI, FZXI	20	–	60	MHz

Notes

25. XBUF duty cycle depends on XTALIN duty cycle.

26. Measured at 1.4 V.

27. Measured between 0.4 V and 2.4 V.

28. Jitter varies with configuration. All standard configurations sample tested at the factory conform to this limit.

Switching Waveforms

Figure 3. All Outputs, Duty Cycle and Rise / Fall Time

Figure 4. Output Tristate Timing [29]

Figure 5. CLK Outputs Jitter and Skew

Figure 6. CPU Frequency Change

Note

29. The CY2292 has weak pull downs on all outputs. Hence, when a tristate condition is forced on the outputs, the output pins are pulled low.

Package Characteristics

Package	θ_{JA} (°C/W)	θ_{JC} (°C/W)	Transistor Count
16-pin SOIC	83	19	9271
16-pin TSSOP	103	32	

Package Diagrams

Acronyms

Acronym	Description
CPU	Central Processing Unit
CMOS	Complementary Metal Oxide Semiconductor
DC	Direct Current
EPROM	Erasable Programmable Read Only Memory
FAE	Field Application Engineer
FTG	Frequency Timing Group
OE	Output Enable
OSC	Oscillator
PD	Power Down
PLL	Phase Locked Loop
ROM	Read Only Memory
SOIC	Small Outline Integrated Circuit
TSSOP	Thin Shrunk Small Outline Package

Document Conventions

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
kΩ	kilohm
MHz	megahertz
μA	microampere
mA	milliampere
ms	millisecond
mW	milliwatt
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
ppm	parts per million
ps	picosecond
V	volt

Document History Page

Document Title: CY2292, Three-PLL General-Purpose EPROM-Programmable Clock Generator				
Document Number: 38-07449				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	116993	DSG	07/01/02	Changed from Spec number: 38-00946 to 38-07449
*A	119639	CKN	12/05/02	Updated Operation : Updated Power Saving Features : Replaced 8 MHz with 20 MHz.
*B	277130	RGL	10/26/04	Updated Ordering Information : Updated part numbers.
*C	395808	RGL	09/07/05	Updated Ordering Information : No change in part numbers. Minor Change: Fixed typo in the "Package Type" column.
*D	2565316	AESA / KVM	09/16/08	Updated CyClocks Software : Updated description. Updated Ordering Information : Updated part numbers. Replaced "Lead-Free" with "Pb-Free". Added Note "Not recommended for new designs." and referred in non Pb-free part numbers. Updated to new template.
*E	2761988	KVM	09/10/09	Updated Selector Guide : Updated details in "Part Number" column. Removed the column "Outputs". Consolidated two rows. Updated Switching Characteristics : Updated details in "Description" column (Updated part number suffixes). Updated Switching Characteristics : Updated details in "Description" column (Updated part number suffixes). Updated Switching Characteristics : Updated details in "Description" column (Updated part number suffixes). Updated Switching Characteristics : Updated details in "Description" column (Updated part number suffixes). Updated Ordering Information : No change in part numbers. Included Temperature Range values in "Operating Range" column. Minor Change: Fixed typo in the "Operating Range" column corresponding to part numbers CY2292FZXI and CY2292FZXIT.
*F	2897775	KVM	03/23/10	Updated Ordering Information : Updated part numbers. Added Possible Configurations . Moved xxx parts from ordering information table to possible configurations table. Updated Package Diagrams .
*G	2948137	KVM	06/09/10	Updated Pinouts : Updated Figure 1 (Updated title only (to include both SOIC and TSSOP)). Added Acronyms .
*H	3010397	KVM	08/18/2010	Removed CY2071F related information in all instances across the document as CY2071F is obsolete. Updated Cypress FTG Programmer : Updated description. Updated Ordering Information : Updated part numbers. Added Ordering Code Definitions .
