4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision D (August 2012) to Revision E | Page |
|--|------|
| • Changed all instances of <i>glitch energy</i> in the data sheet to <i>glitch impulse</i> | 1 |
| • Changed <i>Applications</i> list | 1 |
| • Revised the Device Comparison Table | 3 |
| • Added an I/O column to the Pin Functions table | 4 |
| • Added storage temperature to the Absolute Maximum Ratings table | 5 |
| • Added ESD Ratings table to the data sheet | 5 |
| • Added Recommended Operating Conditions table to the data sheet | 5 |
| • Deleted several notes following the Thermal Information table | 5 |
| • Replaced the previous typical application | 41 |

| Changes from Revision C (June 2011, first official release) to Revision D | Page |
|---|------|
| • Replaced text "QFN" with "SON" (name change only, package and orderable did not change) | 1 |
| • Typical power-down current consumption changed from 10 nA to 550 nA | 1 |
| • Changed power requirements specifications | 8 |
| • Power-down current vs Temperature typical characteristic plot updated, $AV_{DD} = 5.5\text{ V}$ | 16 |
| • Power-down current vs Power-supply voltage typical characteristic plot updated | 16 |
| • Added Power-On Reset (POR) Levels section | 31 |

5 Device Comparison Table

| DEVICE | MAXIMUM RELATIVE ACCURACY (LSB) | MAXIMUM DIFFERENTIAL NONLINEARITY (LSB) | MAXIMUM REFERENCE DRIFT (ppm/°C) | RESET TO |
|---------|---------------------------------|---|----------------------------------|-----------|
| DAC7562 | ±0.75 | ±0.25 | 10 | Zero |
| DAC7563 | | | | Mid-scale |
| DAC8162 | ±3 | ±0.5 | 10 | Zero |
| DAC8163 | | | | Mid-scale |
| DAC8562 | ±12 | ±1 | 10 | Zero |
| DAC8563 | | | | Mid-scale |

6 Pin Configuration and Functions

(1) TI recommends connecting the thermal pad to the ground plane for better thermal dissipation.

Pin Functions

| PIN | | I/O | DESCRIPTION |
|---|-----|-----|--|
| NAME | NO. | | |
| AV _{DD} | 9 | I | Power-supply input, 2.7 V to 5.5 V |
| $\overline{\text{CLR}}$ | 5 | I | Asynchronous clear input. The $\overline{\text{CLR}}$ input is falling-edge sensitive. On activation of $\overline{\text{CLR}}$, zero scale (DACxx62) or mid-scale (DACxx63) is loaded to all input and DAC registers. This sets the DAC output voltages accordingly. The device exits clear code mode on the 24 th falling edge of the next write to the device. Activating $\overline{\text{CLR}}$ during a write sequence aborts the write. |
| D _{IN} | 8 | I | Serial data input. Data are clocked into the 24-bit input shift register on each falling edge of the serial clock input. Schmitt-trigger logic input |
| GND | 3 | — | Ground reference point for all circuitry on the device |
| $\overline{\text{LDAC}}$ | 4 | I | In <i>synchronous</i> mode, data update occurs with the falling edge of the 24 th SCLK cycle, which follows a falling edge of SYNC. Such <i>synchronous</i> updates do not require the LDAC, which must be connected to GND permanently or asserted and held low before sending commands to the device. In <i>asynchronous</i> mode, the $\overline{\text{LDAC}}$ pin is used as a negative edge-triggered timing signal for simultaneous DAC updates. Multiple single-channel commands can be written in order to set different channel buffers to desired values and then make a falling edge on the LDAC pin to update the DAC output registers simultaneously. |
| SCLK | 7 | I | Serial clock input. Data can be transferred at rates up to 50 MHz. Schmitt-trigger logic input |
| $\overline{\text{SYNC}}$ | 6 | I | Level-triggered control input (active-low). This input is the frame synchronization signal for the input data. When $\overline{\text{SYNC}}$ goes low, it enables the input shift register, and data are sampled on subsequent falling clock edges. The DAC output updates following the 24 th clock falling edge. If $\overline{\text{SYNC}}$ is taken high before the 23 rd clock edge, the rising edge of SYNC acts as an interrupt, and the write sequence is ignored by the DAC756x, DAC816x, and DAC856x devices. Schmitt-trigger logic input |
| V _{OUTA} | 1 | O | Analog output voltage from DAC-A |
| V _{OUTB} | 2 | O | Analog output voltage from DAC-B |
| V _{REFIN} /V _{REFOUT} | 10 | I/O | Bidirectional voltage reference pin. If internal reference is used, 2.5-V output. |

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

Over operating ambient temperature range (unless otherwise noted).

| | MIN | MAX | UNIT |
|--|------|----------------|------|
| V_{DD} to GND | -0.3 | 6 | V |
| \overline{CLR} , D_{IN} , \overline{LDAC} , \overline{SCLK} and \overline{SYNC} input voltage to GND | -0.3 | $V_{DD} + 0.3$ | V |
| $V_{OUT[A, B]}$ to GND | -0.3 | $V_{DD} + 0.3$ | V |
| V_{REFIN}/V_{REFOUT} to GND | -0.3 | $V_{DD} + 0.3$ | V |
| Operating temperature range | -40 | 125 | °C |
| Junction temperature, T_J | | 150 | °C |
| Storage temperature, T_{stg} | -65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

| | | VALUE | UNIT |
|-------------------------------------|--|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±1000 | V |
| | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±500 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|-------------------------------------|---|-----|-----|----------|------|
| POWER SUPPLY | | | | | |
| Supply voltage | V_{DD} to GND | 2.7 | | 5.5 | V |
| DIGITAL INPUTS | | | | | |
| Digital input voltage | \overline{CLR} , D_{IN} , \overline{LDAC} , \overline{SCLK} and \overline{SYNC} | 0 | | V_{DD} | V |
| REFERENCE INPUT | | | | | |
| V_{REFIN} Reference input voltage | | 0 | | V_{DD} | V |
| TEMPERATURE RANGE | | | | | |
| T_A Operating ambient temperature | | -40 | | 125 | °C |

7.4 Thermal Information

| THERMAL METRIC | | DAC756x, DAC816x, DAC856x | | UNIT |
|----------------------|--|---------------------------|-------------|------|
| | | DSC (WSON) | DGS (VSSOP) | |
| | | 10 PINS | 10 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 62.8 | 173.8 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 44.3 | 48.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 26.5 | 79.9 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 0.4 | 1.7 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 25.5 | 68.4 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 46.2 | N/A | °C/W |

7.5 Electrical Characteristics

At $V_{DD} = 2.7\text{ V to }5.5\text{ V}$ and $T_A = -40^\circ\text{C to }125^\circ\text{C}$ (unless otherwise noted).

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---------------------------|--|-----|-------|----------|------------------|
| STATIC PERFORMANCE⁽¹⁾ | | | | | | |
| DAC856x | Resolution | | 16 | | | Bits |
| | Relative accuracy | Using line passing through codes 512 and 65,024 | | ±4 | ±12 | LSB |
| | Differential nonlinearity | 16-bit monotonic | | ±0.2 | ±1 | LSB |
| DAC816x | Resolution | | 14 | | | Bits |
| | Relative accuracy | Using line passing through codes 128 and 16,256 | | ±1 | ±3 | LSB |
| | Differential nonlinearity | 14-bit monotonic | | ±0.1 | ±0.5 | LSB |
| DAC756x | Resolution | | 12 | | | Bits |
| | Relative accuracy | Using line passing through codes 32 and 4,064 | | ±0.3 | ±0.75 | LSB |
| | Differential nonlinearity | 12-bit monotonic | | ±0.05 | ±0.25 | LSB |
| Offset error | | Extrapolated from two-point line ⁽¹⁾ , unloaded | | ±1 | ±4 | mV |
| Offset error drift | | | | ±2 | | μV/°C |
| Full-scale error | | DAC register loaded with all 1s | | ±0.03 | ±0.2 | % FSR |
| Zero-code error | | DAC register loaded with all 0s | | 1 | 4 | mV |
| Zero-code error drift | | | | ±2 | | μV/°C |
| Gain error | | Extrapolated from two-point line ⁽¹⁾ , unloaded | | ±0.01 | ±0.15 | % FSR |
| Gain temperature coefficient | | | | ±1 | | ppm FSR/°C |
| OUTPUT CHARACTERISTICS⁽²⁾ | | | | | | |
| Output voltage range | | | 0 | | V_{DD} | V |
| Output voltage settling time ⁽³⁾ | | DACs unloaded | | 7 | | μs |
| | | $R_L = 1\text{ M}\Omega$ | | 10 | | |
| Slew rate | | Measured between 20%–80% of a full-scale transition | | 0.75 | | V/μs |
| Capacitive load stability | | $R_L = \infty$ | | 1 | | nF |
| | | $R_L = 2\text{ k}\Omega$ | | 3 | | |
| Code-change glitch impulse | | 1-LSB change around major carry | | 0.1 | | nV-s |
| Digital feedthrough | | SCLK toggling, SYNC high | | 0.1 | | nV-s |
| Power-on glitch impulse | | $R_L = 2\text{ k}\Omega$, $C_L = 470\text{ pF}$, $V_{DD} = 5.5\text{ V}$ | | 40 | | mV |
| Channel-to-channel dc crosstalk | | Full-scale swing on adjacent channel, External reference | | 5 | | μV |
| | | Full-scale swing on adjacent channel, Internal reference | | 15 | | |
| DC output impedance | | At mid-scale input | | 5 | | Ω |
| Short-circuit current | | DAC outputs at full-scale, DAC outputs shorted to GND | | 40 | | mA |
| Power-up time, including settling time | | Coming out of power-down mode | | 50 | | μs |
| AC PERFORMANCE⁽²⁾ | | | | | | |
| DAC output noise density | | $T_A = 25^\circ\text{C}$, at mid-scale input, $f_{OUT} = 1\text{ kHz}$ | | 90 | | nV/√Hz |
| DAC output noise | | $T_A = 25^\circ\text{C}$, at mid-scale input, 0.1 Hz to 10 Hz | | 2.6 | | μV _{PP} |

(1) 16-bit: codes 512 and 65,024; 14-bit: codes 128 and 16,256; 12-bit: codes 32 and 4,064

(2) Specification based on design or characterization. Not production tested

(3) Transition time between 1 / 4 scale and 3 / 4 scale, including settling to within ±0.024% FSR

Electrical Characteristics (continued)

At $V_{DD} = 2.7\text{ V to }5.5\text{ V}$ and $T_A = -40^\circ\text{C to }125^\circ\text{C}$ (unless otherwise noted).

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---------------------|------|----------|------------------|
| LOGIC INPUTS⁽²⁾ | | | | | |
| Input-pin leakage current | | -1 | ±0.1 | 1 | μA |
| Logic input LOW voltage V_{IL} | | 0 | | 0.8 | V |
| Logic input HIGH voltage V_{IH} | | $0.7 \times V_{DD}$ | | V_{DD} | V |
| Pin capacitance | | | | 3 | pF |
| REFERENCE | | | | | |
| External reference current | External $V_{REF} = 2.5\text{ V}$ (when internal reference is disabled), all channels active using gain = 1 | | 15 | | μA |
| Reference input impedance | Internal reference disabled, gain = 1 | | 170 | | kΩ |
| | Internal reference disabled, gain = 2 | | 85 | | |
| REFERENCE OUTPUT | | | | | |
| Output voltage | $T_A = 25^\circ\text{C}$ | 2.495 | 2.5 | 2.505 | V |
| Initial accuracy | $T_A = 25^\circ\text{C}$ | -5 | ±0.1 | 5 | mV |
| Output-voltage temperature drift | | | 4 | 10 | ppm/°C |
| Output-voltage noise | $f = 0.1\text{ Hz to }10\text{ Hz}$ | | 12 | | μV _{PP} |
| Output-voltage noise density (high-frequency noise) | $T_A = 25^\circ\text{C}$, $f = 1\text{ kHz}$, $C_L = 0\text{ μF}$ | | 250 | | nV/√Hz |
| | $T_A = 25^\circ\text{C}$, $f = 1\text{ MHz}$, $C_L = 0\text{ μF}$ | | 30 | | |
| | $T_A = 25^\circ\text{C}$, $f = 1\text{ MHz}$, $C_L = 4.7\text{ μF}$ | | 10 | | |
| Load regulation, sourcing ⁽⁴⁾ | $T_A = 25^\circ\text{C}$ | | 20 | | μV/mA |
| Load regulation, sinking ⁽⁴⁾ | $T_A = 25^\circ\text{C}$ | | 185 | | μV/mA |
| Output-current load capability ⁽²⁾ | | | ±20 | | mA |
| Line regulation | $T_A = 25^\circ\text{C}$ | | 50 | | μV/V |
| Long-term stability or drift (aging) ⁽⁴⁾ | $T_A = 25^\circ\text{C}$, time = 0 to 1900 hours | | 100 | | ppm |
| Thermal hysteresis ⁽⁴⁾ | First cycle | | 200 | | ppm |
| | Additional cycles | | 50 | | |

(4) See the [Application Information](#) section of this data sheet.

Electrical Characteristics (continued)

At $V_{DD} = 2.7\text{ V to }5.5\text{ V}$ and $T_A = -40^\circ\text{C to }125^\circ\text{C}$ (unless otherwise noted).

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|-----|------|------|---------------|
| POWER REQUIREMENTS⁽⁵⁾ | | | | | |
| Power supply current (I_{DD}) | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, normal mode, internal reference off | | 0.25 | 0.5 | mA |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, normal mode, internal reference on | | 0.9 | 1.6 | |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, power-down modes ⁽⁶⁾ | | 0.55 | 2 | μA |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, power-down modes | | 0.55 | 4 | |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, normal mode, internal reference off | | 0.2 | 0.4 | mA |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, normal mode, internal reference on | | 0.73 | 1.4 | |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, power-down modes ⁽⁶⁾ | | 0.35 | 2 | μA |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, power-down modes | | 0.35 | 3 | |
| Power dissipation | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, normal mode, internal reference off | | 0.9 | 2.75 | mW |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, normal mode, internal reference on | | 3.2 | 8.8 | |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, power-down modes ⁽⁶⁾ | | 2 | 11 | μW |
| | $V_{DD} = 3.6\text{ V to }5.5\text{ V}$, power-down modes | | 2 | 22 | |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, normal mode, internal reference off | | 0.54 | 1.44 | mW |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, normal mode, internal reference on | | 1.97 | 5 | |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, power-down modes ⁽⁶⁾ | | 0.95 | 7.2 | μW |
| | $V_{DD} = 2.7\text{ V to }3.6\text{ V}$, power-down modes | | 0.95 | 10.8 | |

(5) Input code = mid-scale, no load, $V_{INH} = V_{DD}$, and $V_{INL} = \text{GND}$

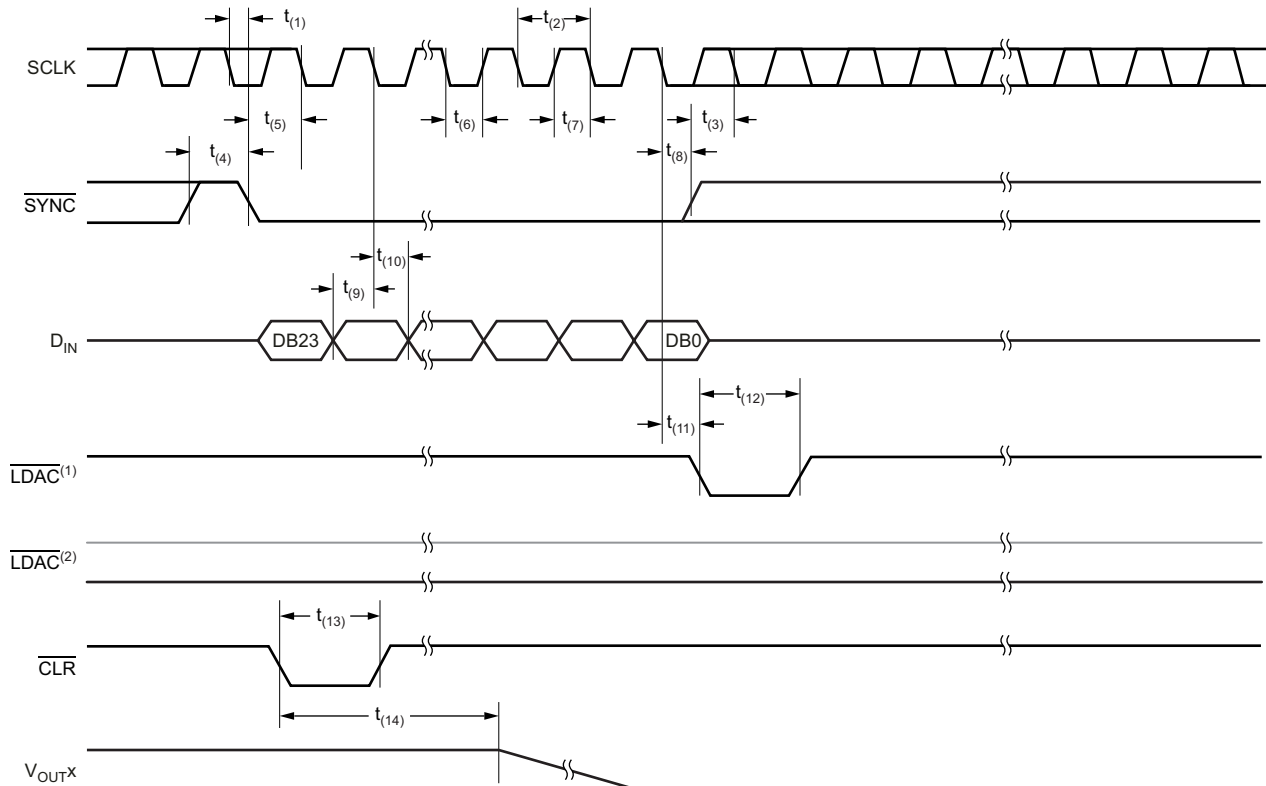

(6) $T_A = -40^\circ\text{C to }105^\circ\text{C}$

7.6 Timing Requirements⁽¹⁾⁽²⁾

At $V_{DD} = 2.7\text{ V}$ to 5.5 V and over -40°C to 125°C (unless otherwise noted).

| | | DAC756x, DAC816x, DAC856x | | | UNIT |
|--------------|--|------------------------------|-----|-----|------|
| | | MIN | TYP | MAX | |
| $f_{(SCLK)}$ | Serial clock frequency | | | 50 | MHz |
| $t_{(1)}$ | SCLK falling edge to $\overline{\text{SYNC}}$ falling edge (for successful write operation) | 10 | | | ns |
| $t_{(2)}$ | SCLK cycle time | 20 | | | ns |
| $t_{(3)}$ | $\overline{\text{SYNC}}$ rising edge to 23 rd SCLK falling edge (for successful $\overline{\text{SYNC}}$ interrupt) | 13 | | | ns |
| $t_{(4)}$ | Minimum $\overline{\text{SYNC}}$ HIGH time | 80 | | | ns |
| $t_{(5)}$ | $\overline{\text{SYNC}}$ to SCLK falling edge setup time | 13 | | | ns |
| $t_{(6)}$ | SCLK LOW time | 8 | | | ns |
| $t_{(7)}$ | SCLK HIGH time | 8 | | | ns |
| $t_{(8)}$ | SCLK falling edge to $\overline{\text{SYNC}}$ rising edge | 10 | | | ns |
| $t_{(9)}$ | Data setup time | 6 | | | ns |
| $t_{(10)}$ | Data hold time | 5 | | | ns |
| $t_{(11)}$ | SCLK falling edge to $\overline{\text{LDAC}}$ falling edge for asynchronous LDAC update mode | 5 | | | ns |
| $t_{(12)}$ | $\overline{\text{LDAC}}$ pulse duration, LOW time | 10 | | | ns |
| $t_{(13)}$ | $\overline{\text{CLR}}$ pulse duration, LOW time | 80 | | | ns |
| $t_{(14)}$ | $\overline{\text{CLR}}$ falling edge to start of V_{OUTX} transition | | | 100 | ns |

- (1) All input signals are specified with $t_r = t_f = 3\text{ ns}$ (10% to 90% of V_{DD}) and timed from a voltage level of $(V_{IL} + V_{IH}) / 2$.
 (2) See the *Serial Write Operation* timing diagram (Figure 1).

- (1) Asynchronous $\overline{\text{LDAC}}$ update mode. For more information, see the [LDAC Functionality](#) section.
 (2) Synchronous $\overline{\text{LDAC}}$ update mode; $\overline{\text{LDAC}}$ remains low. For more information, see the [LDAC Functionality](#) section.

8 Detailed Description

8.1 Overview

The DAC756x, DAC816x, and DAC856x devices are low-power, voltage-output, dual-channel, 16-, 14-, and 12-bit digital-to-analog converters (DACs), respectively. These devices include a 2.5-V, 4-ppm/°C internal reference, giving a full-scale output voltage range of 2.5 V or 5 V. The internal reference has an initial accuracy of ±5 mV and can source or sink up to 20 mA at the V_{REFIN}/V_{REFOUT} pin.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Digital-to-Analog Converter (DAC)

The DAC756x, DAC816x, and DAC856x architecture consists of two string DACs, each followed by an output buffer amplifier. The devices include an internal 2.5-V reference with 4-ppm/°C temperature drift performance. [Figure 88](#) shows a principal block diagram of the DAC architecture.

Figure 88. DAC Architecture

The input coding to the DAC756x, DAC816x, and DAC856x devices is straight binary, so the ideal output voltage is given by [Equation 1](#):

$$V_{OUT} = \left(\frac{D_{IN}}{2^n} \right) \times V_{REF} \times \text{Gain} \quad (1)$$

where:

n = resolution in bits; either 12 (DAC756x), 14 (DAC816x) or 16 (DAC856x)

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register. D_{IN} ranges from 0 to $2^n - 1$.
 V_{REF} = DAC reference voltage; either V_{REFOUT} from the internal 2.5-V reference or V_{REFIN} from an external reference.

Gain = 1 by default when internal reference is disabled (using external reference), and gain = 2 by default when using internal reference. Gain can also be manually set to either 1 or 2 using the gain register. See the [Gain Function](#) section for more information.

Feature Description (continued)

8.3.1.1 Resistor String

The resistor string section is shown in [Figure 89](#). It is simply a string of resistors, each of value R . The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier. The resistor string architecture results in monotonicity. The R_{DIVIDER} switch is controlled by the gain registers (see the [Gain Function](#) section). Because the output amplifier has a gain of 2, R_{DIVIDER} is not shorted when the DAC-n gain is set to 1 (default if internal reference is disabled), and is shorted when the DAC-n gain is set to 2 (default if internal reference is enabled).

Figure 89. Resistor String

8.3.1.2 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving a maximum output range of 0 V to AV_{DD} . It is capable of driving a load of 2 k Ω in parallel with 3 nF to GND. The typical slew rate is 0.75 V/ μs , with a typical full-scale settling time of 14 μs as shown in [Figure 31](#), [Figure 32](#), [Figure 75](#) and [Figure 76](#).

Feature Description (continued)

8.3.2 Internal Reference

The DAC756x, DAC816x, and DAC856x devices include a 2.5-V internal reference that is disabled by default. The internal reference is externally available at the V_{REFIN}/V_{REFOUT} pin. The internal reference output voltage is 2.5 V and can sink and source up to 20 mA.

A minimum 150-nF capacitor is recommended between the reference output and GND for noise filtering.

The internal reference of the DAC756x, DAC816x, and DAC856x devices is a bipolar transistor-based precision band-gap voltage reference. Figure 90 shows the basic band-gap topology. Transistors Q_1 and Q_2 are biased such that the current density of Q_1 is greater than that of Q_2 . The difference of the two base-emitter voltages ($V_{BE1} - V_{BE2}$) has a positive temperature coefficient and is forced across resistor R_1 . This voltage is amplified and added to the base-emitter voltage of Q_2 , which has a negative temperature coefficient. The resulting output voltage is virtually independent of temperature. The short-circuit current is limited by design to approximately 100 mA.

Figure 90. Band-Gap Reference Simplified Schematic

8.3.3 Power-On Reset

8.3.3.1 Power-On Reset to Zero-Scale

The DAC7562, DAC8162, and DAC8562 devices contain a power-on-reset circuit that controls the output voltage during power up. All device registers are reset as shown in Table 4. At power up, all DAC registers are filled with zeros and the output voltages of all DAC channels are set to zero volts. Each DAC channel remains that way until a valid load command is written to it. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. No device pin should be brought high before applying power to the device. The internal reference is disabled by default and remains that way until a valid reference-change command is executed.

8.3.3.2 Power-On Reset to Mid-Scale

The DAC7563, DAC8163, and DAC8563 devices contain a power-on reset circuit that controls the output voltage during power up. At power up, all DAC registers are reset to mid-scale code and the output voltages of all DAC channels are set to $V_{REFIN} / 2$ volts. Each DAC channel remains that way until a valid load command is written to it. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. No device pin should be brought high before applying power to the device. The internal reference is powered off or down by default and remains that way until a valid reference-change command is executed. If using an external reference, it is acceptable to power on the V_{REFIN} pin either at the same time as or after applying AV_{DD} .

Table 4. DACxx62 and DACxx63 Power-On Reset Values

| REGISTER | DEFAULT SETTING | |
|-----------------------------|------------------------------------|------------|
| DAC and input registers | DACxx62 | Zero-scale |
| | DACxx63 | Mid-scale |
| LDAC registers | LDAC pin enabled for both channels | |
| Power-down registers | DACs powered up | |
| Internal reference register | Internal reference disabled | |
| Gain registers | Gain = 1 for both channels | |

8.3.3.3 Power-On Reset (POR) Levels

When the device powers up, a POR circuit sets the device in default mode as shown in Table 4. The POR circuit requires specific AV_{DD} levels, as indicated in Figure 91, to ensure discharging of internal capacitors and to reset the device on power up. In order to ensure a power-on reset, AV_{DD} must be below 0.7 V for at least 1 ms. When AV_{DD} drops below 2.2 V but remains above 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions. In this case, TI recommends a power-on reset. When AV_{DD} remains above 2.2 V, a power-on reset does not occur.

Figure 91. Relevant Voltage Levels for POR Circuit

8.4 Device Functional Modes

8.4.1 Power-Down Modes

The DAC756x, DAC816x, and DAC856x devices have two separate sets of power-down commands. One set is for the DAC channels and the other set is for the internal reference. The internal reference is forced to a powered-down state while both DAC channels are powered down, and is only enabled if any DAC channel is also in the normal mode of operation. For more information on the internal reference control, see the [Internal Reference Enable Register](#) section.

8.4.1.1 DAC Power-Down Commands

The DAC756x, DAC816x, and DAC856x DACs use four modes of operation. These modes are accessed by setting the serial interface command bits to 100. Once the command bits are set correctly, the four different power-down modes are software programmable by setting bits DB5 and DB4 in the shift register. [Table 5](#) and [Table 6](#) show the different power-down options. For more information on how to set the DAC operating mode see [Table 17](#).

Table 5. DAC-n Operating Modes

| DB5 | DB4 | DAC Modes of Operation |
|-----|-----|--|
| 0 | 0 | Selected DACs power up (normal mode, default) |
| 0 | 1 | Selected DACs power down, output 1 kΩ to GND |
| 1 | 0 | Selected DACs power down, output 100 kΩ to GND |
| 1 | 1 | Selected DACs power down, output Hi-Z to GND |

Table 6. DAC-n Selection for Operating Modes

| DAC-B (DB1), DAC-A (DB0) | Operating Mode |
|--------------------------|--|
| 0 | DAC-n does not change operating mode |
| 1 | DAC-n operating mode set to value on PD1 and PD0 |

It is possible to write to the DAC register or buffer of the DAC channel that is powered down. When the DAC channel is then powered up, it powers up to this new value.

The advantage of the available power-down modes is that the output impedance of the device is known while it is in power-down mode. As described in [Table 5](#), there are three different power-down options. V_{OUT} can be connected internally to GND through a 1-kΩ resistor, a 100-kΩ resistor, or open-circuited (Hi-Z). The DAC power-down circuitry is shown in [Figure 92](#).

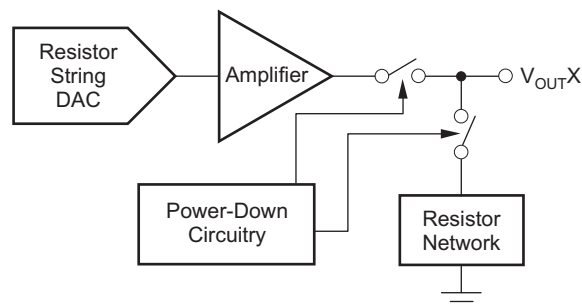

Figure 92. Output Stage

8.4.2 Gain Function

The gain register controls the GAIN setting in the DAC transfer function:

$$V_{OUT} = \left(\frac{D_{IN}}{2^n} \right) \times V_{REF} \times \text{Gain} \quad (2)$$

The DAC756x, DAC816x, and DAC856x devices have a gain register for each channel. The gain for each channel, in [Equation 2](#), is either 1 or 2. This gain is automatically set to 2 when using the internal reference, and is automatically set to 1 when the internal reference is disabled (default). However, each channel can have either gain by setting the registers appropriately. The gain registers are accessible by setting the serial interface command bits to 000, address bits to 010, and using DB1 for DAC-B and DB0 for DAC-A. See [Table 7](#) and [Table 17](#) for the full command structure. The gain registers are automatically reset to provide either gain of 1 or 2 when the internal reference is powered off or on, respectively. After the reference is powered off or on, the gain register is again accessible to change the gain.

Table 7. DAC-n Selection for Gain Register Command

| DB1, DB0 | Value | Gain |
|----------|-------|---|
| DB0 | 0 | DAC-A uses gain = 2 (default with internal reference) |
| | 1 | DAC-A uses gain = 1 (default with external reference) |
| DB1 | 0 | DAC-B uses gain = 2 (default with internal reference) |
| | 1 | DAC-B uses gain = 1 (default with external reference) |

8.4.3 Software Reset Function

The DAC756x, DAC816x, and DAC856x devices contain a software reset feature. The software reset function is accessed by setting the serial interface command bits to 101. The software reset command contains two reset modes which are software-programmable by setting bit DB0 in the shift register. [Table 8](#) and [Table 17](#) show the available software reset commands.

Table 8. Software Reset

| DB0 | Registers Reset to Default Values |
|-----|---|
| 0 | DAC registers Input registers |
| 1 | DAC registers Input registers LDAC registers Power-down registers Internal reference register Gain registers |

8.4.4 Internal Reference Enable Register

The internal reference in the DAC756x, DAC816x, and DAC856x devices is disabled by default for debugging, evaluation purposes, or when using an external reference. The internal reference can be powered up and powered down by setting the serial interface command bits to 111 and configuring DB0 (see [Table 9](#)). The internal reference is forced to a powered down state while both DAC channels are powered down, and can only be enabled if any DAC channel is in normal mode of operation. During the time that the internal reference is disabled, the DAC functions normally using an external reference. At this point, the internal reference is disconnected from the V_{REFIN}/V_{REFOUT} pin (Hi-Z output).

Table 9. Internal Reference

| DB0 | Internal Reference Configuration |
|-----|---|
| 0 | Disable internal reference and reset DACs to gain = 1 |
| 1 | Enable internal reference and reset DACs to gain = 2 |

8.4.4.1 Enabling Internal Reference

To enable the internal reference, refer to the command structure in [Table 17](#). When performing a power cycle to reset the device, the internal reference is switched off (default mode). In the default mode, the internal reference is powered down until a valid write sequence powers up the internal reference. However, the internal reference is forced to a disabled state while both DAC channels are powered down, and remains disabled until either DAC channel is returned to the normal mode of operation. See [DAC Power-Down Commands](#) for more information on DAC channel modes of operation.

8.4.4.2 Disabling Internal Reference

To disable the internal reference, refer to the command structure in [Table 17](#). When performing a power cycle to reset the device, the internal reference is disabled (default mode).

8.4.5 CLR Functionality

The edge-triggered $\overline{\text{CLR}}$ pin can be used to set the input and DAC registers immediately according to [Table 10](#). When the $\overline{\text{CLR}}$ pin receives a falling edge signal the clear mode is activated and changes the DAC output voltages accordingly. The device exits clear mode on the 24th falling edge of the next write to the device. If the $\overline{\text{CLR}}$ pin receives a falling edge signal during a write sequence in normal operation, the clear mode is activated and changes the input and DAC registers immediately according to [Table 10](#).

Table 10. Clear Mode Reset Values

| DEVICE | DAC Output Entering Clear Mode |
|---------------------------|--------------------------------|
| DAC8562, DAC8162, DAC7562 | Zero-scale |
| DAC8563, DAC8163, DAC7563 | Mid-scale |

8.4.6 LDAC Functionality

The DAC756x, DAC816x, and DAC856x devices offer both a software and hardware simultaneous update and control function. The DAC double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs.

DAC756x, DAC816x, and DAC856x data updates can be performed either in *synchronous* or in *asynchronous* mode.

In *asynchronous* mode, the $\overline{\text{LDAC}}$ pin is used as a negative edge-triggered timing signal for simultaneous DAC updates. Multiple single-channel writes can be done in order to set different channel buffers to desired values and then make a falling edge on $\overline{\text{LDAC}}$ pin to simultaneously update the DAC output registers. Data buffers of all channels must be loaded with desired data before an $\overline{\text{LDAC}}$ falling edge. After a high-to-low $\overline{\text{LDAC}}$ transition, all DACs are simultaneously updated with the last contents of the corresponding data buffers. If the content of a data buffer is not changed, the corresponding DAC output remains unchanged after the $\overline{\text{LDAC}}$ pin is triggered. $\overline{\text{LDAC}}$ must be returned high before the next serial command is initiated.

In *synchronous* mode, data are updated with the falling edge of the 24th SCLK cycle, which follows a falling edge of SYNC. For such *synchronous* updates, the $\overline{\text{LDAC}}$ pin is not required, and it must be connected to GND permanently or asserted and held low before sending commands to the device.

Alternatively, all DAC outputs can be updated simultaneously using the built-in software function of LDAC. The LDAC register offers additional flexibility and control by allowing the selection of which DAC channel(s) should be updated simultaneously when the $\overline{\text{LDAC}}$ pin is being brought low. The LDAC register is loaded with a 2-bit word (DB1 and DB0) using command bits C2, C1, and C0 (see [Table 17](#)). The default value for each bit, and therefore for each DAC channel, is zero. If the LDAC register bit is set to 1, it overrides the $\overline{\text{LDAC}}$ pin (the $\overline{\text{LDAC}}$ pin is internally tied low for that particular DAC channel) and this DAC channel updates synchronously after the falling edge of the 24th SCLK cycle. However, if the LDAC register bit is set to 0, the DAC channel is controlled by the $\overline{\text{LDAC}}$ pin.

The combination of software and hardware simultaneous update functions is particularly useful in applications when updating a DAC channel, while keeping the other channel unaffected; see [Table 11](#) and [Table 17](#) for more information.

Table 11. DAC-n Selection for LDAC Register Command

| DB1, DB0 | Value | $\overline{\text{LDAC}}$ Pin Functionality |
|----------|-------|--|
| DB0 | 0 | DAC-A uses $\overline{\text{LDAC}}$ pin |
| | 1 | DAC-A operates in synchronous mode |
| DB1 | 0 | DAC-B uses $\overline{\text{LDAC}}$ pin |
| | 1 | DAC-B operates in synchronous mode |

8.5 Programming

The DAC756x, DAC816x, and DAC856x devices have a three-wire serial interface ($\overline{\text{SYNC}}$, SCLK, and D_{IN} ; see the table) compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the Serial Write Operation timing diagram (Figure 1) for an example of a typical write sequence.

The DAC756x, DAC816x, or DAC856x input shift register is 24 bits wide, consisting of two *don't care* bits (DB23 to DB22), three command bits (DB21 to DB19), three address bits (DB18 to DB16), and 16 data bits (DB15 to DB0). All 24 bits of data are loaded into the DAC under the control of the serial clock input, SCLK. DB23 (MSB) is the first bit that is loaded into the DAC shift register. DB23 is followed by the rest of the 24-bit word pattern, left-aligned. This configuration means that the first 24 bits of data are latched into the shift register, and any further clocking of data is ignored.

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the D_{IN} line are clocked into the 24-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 50 MHz, making the DAC756x, DAC816x, and DAC856x devices compatible with high-speed DSPs. On the 24th falling edge of the serial clock, the last data bit is clocked into the shift register and the shift register locks. Further clocking does not change the shift register data.

After receiving the 24th falling clock edge, the DAC756x, DAC816x, and DAC856x devices decode the three command bits, three address bits and 16 data bits to perform the required function, without waiting for a $\overline{\text{SYNC}}$ rising edge. After the 24th falling edge of SCLK is received, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, the minimum delay time from the 24th falling SCLK edge to the next falling $\overline{\text{SYNC}}$ edge must be met in order to begin the next cycle properly; see the Serial Write Operation timing diagram (Figure 1).

A rising edge of $\overline{\text{SYNC}}$ before the 24-bit sequence is complete resets the SPI interface; no data transfer occurs. A new write sequence starts at the next falling edge of $\overline{\text{SYNC}}$. To assure the lowest power consumption of the device, care should be taken that the levels are as close to each rail as possible.

8.5.1 $\overline{\text{SYNC}}$ Interrupt

In a normal write sequence, the $\overline{\text{SYNC}}$ line stays low for at least 24 falling edges of SCLK and the addressed DAC register updates on the 24th falling edge. However, if $\overline{\text{SYNC}}$ is brought high before the 23rd falling edge, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (as shown in Figure 93).

Figure 93. $\overline{\text{SYNC}}$ Interrupt Facility

Programming (continued)

8.5.2 DAC Register Configuration

When the DAC registers are being written to, the DAC756x, DAC816x, and DAC856x devices receive all 24 bits of data, ignore DB23 and DB22, and decode the next three bits (DB21 to DB19) in order to determine the DAC operating or control mode (see [Table 12](#)). Bits DB18 to DB16 are used to address the DAC channels (see [Table 13](#)).

Table 12. Commands for the DAC756x, DAC816x, and DAC856x Devices

| C2 (DB21) | C1 (DB20) | C0 (DB19) | Command |
|-----------|-----------|-----------|---|
| 0 | 0 | 0 | Write to input register n (Table 13) |
| 0 | 0 | 1 | Software LDAC, update DAC register n (Table 13) |
| 0 | 1 | 0 | Write to input register n (Table 13) and update all DAC registers |
| 0 | 1 | 1 | Write to input register n and update DAC register n (Table 13) |
| 1 | 0 | 0 | Set DAC power up or -down mode |
| 1 | 0 | 1 | Software reset |
| 1 | 1 | 0 | Set LDAC registers |
| 1 | 1 | 1 | Enable or disable the internal reference |

Table 13. Address Select for the DAC756x, DAC816x, and DAC856x Devices

| A2 (DB18) | A1 (DB17) | A0 (DB16) | Channel (n) |
|-----------|-----------|-----------|----------------------------------|
| 0 | 0 | 0 | DAC-A |
| 0 | 0 | 1 | DAC-B |
| 0 | 1 | 0 | Gain (only use with command 000) |
| 0 | 1 | 1 | Reserved |
| 1 | 0 | 0 | Reserved |
| 1 | 0 | 1 | Reserved |
| 1 | 1 | 0 | Reserved |
| 1 | 1 | 1 | DAC-A and DAC-B |

When writing to the DAC input registers the next 16, 14, or 12 bits of data that follow are decoded by the DAC to determine the equivalent analog output (see [Table 14](#) through [Table 16](#)). The data format is straight binary, with all 0s corresponding to 0-V output and all 1s corresponding to full-scale output. For all documentation purposes, the data format and representation used here is a true 16-bit pattern (that is, FFFFh data word for full scale) that the DAC756x, DAC816x, and DAC856x devices require.

Table 14. DAC856x Data Input Register Format

| | | COMMAND | | | ADDRESS | | | DATA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 DAC Internal Reference

The internal reference of the DAC756x, DAC816x, and DAC856x devices does not require an external load capacitor for stability because it is stable without any capacitive load. However, for improved noise performance, an external load capacitor of 150 nF or larger connected to the V_{REFIN}/V_{REFOUT} output is recommended. Figure 94 shows the typical connections required for operation of the DAC756x, DAC816x, and DAC856x internal reference. A supply bypass capacitor at the AV_{DD} input is also recommended.

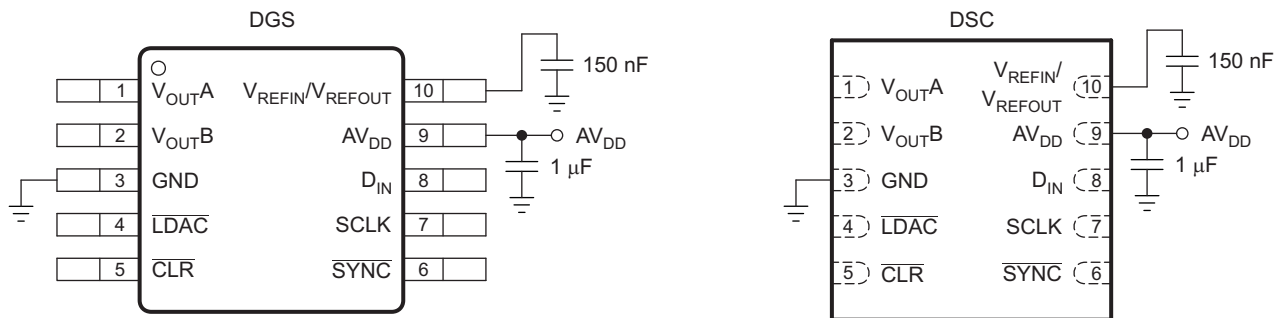

Figure 94. Typical Connections for Operating the DAC756x, DAC816x, and DAC856x Internal Reference

9.1.1.1 Supply Voltage

The internal reference features an extremely low dropout voltage. It can be operated with a supply of only 5 mV above the reference output voltage in an unloaded condition. For loaded conditions, see the [Load Regulation](#) section. The stability of the internal reference with variations in supply voltage (line regulation, dc PSRR) is also exceptional. Within the specified supply voltage range of 2.7 V to 5.5 V, the variation at V_{REFIN}/V_{REFOUT} is typically 50 $\mu\text{V/V}$; see [Figure 7](#).

9.1.1.2 Temperature Drift

The internal reference is designed to exhibit minimal drift error, defined as the change in reference output voltage over varying temperature. The drift is calculated using the box method described by [Equation 3](#):

$$\text{Drift Error} = \left(\frac{V_{REF_MAX} - V_{REF_MIN}}{V_{REF} \times T_{RANGE}} \right) \times 10^6 \text{ (ppm/}^\circ\text{C)} \quad (3)$$

where:

V_{REF_MAX} = maximum reference voltage observed within temperature range T_{RANGE} .

V_{REF_MIN} = minimum reference voltage observed within temperature range T_{RANGE} .

V_{REF} = 2.5 V, target value for reference output voltage.

T_{RANGE} = the characterized range from -40°C to 125°C (165 $^\circ\text{C}$ range)

The internal reference features an exceptional typical drift coefficient of 4 ppm/ $^\circ\text{C}$ from -40°C to 125°C . Characterizing a large number of units, a maximum drift coefficient of 10 ppm/ $^\circ\text{C}$ is observed. Temperature drift results are summarized in [Figure 3](#).

Application Information (continued)

9.1.1.3 Noise Performance

Typical 0.1-Hz to 10-Hz voltage noise and noise spectral density performance are listed in the [Electrical Characteristics](#). Additional filtering can be used to improve output noise levels, although care should be taken to ensure the output impedance does not degrade the ac performance. The output noise spectrum at the V_{REFIN}/V_{REFOUT} pin, both unloaded and with an external 4.7- μ F load capacitor, is shown in [Figure 6](#). Internal reference noise impacts the DAC output noise when the internal reference is used.

9.1.1.4 Load Regulation

Load regulation is defined as the change in reference output voltage as a result of changes in load current. The load regulation of the internal reference is measured using force and sense contacts as shown in [Figure 95](#). The force and sense lines reduce the impact of contact and trace resistance, resulting in accurate measurement of the load regulation contributed solely by the internal reference. Measurement results are shown in [Figure 4](#). Force and sense lines should be used for applications that require improved load regulation.

Figure 95. Accurate Load Regulation of the DAC756x, DAC816x, and DAC856x Internal Reference

9.1.1.4.1 Long-Term Stability

Long-term stability or aging refers to the change of the output voltage of a reference over a period of months or years. This effect lessens as time progresses. The typical drift value for the internal reference is listed in the [Electrical Characteristics](#) and measurement results are shown in [Figure 5](#). This parameter is characterized by powering up multiple devices and measuring them at regular intervals.

9.1.1.5 Thermal Hysteresis

Thermal hysteresis for a reference is defined as the change in output voltage after operating the device at 25°C, cycling the device through the operating temperature range, and returning to 25°C. Hysteresis is expressed by [Equation 4](#):

$$V_{HYST} = \left[\frac{V_{REF_PRE} - V_{REF_POST}}{V_{REF_NOM}} \right] \times 10^6 (\text{ppm}/^\circ\text{C}) \quad (4)$$

where:

V_{HYST} = thermal hysteresis.

V_{REF_PRE} = output voltage measured at 25°C pre-temperature cycling.

V_{REF_POST} = output voltage measured after the device cycles through the temperature range of –40°C to 125°C, and returns to 25°C.

V_{REF_NOM} = 2.5 V, target value for reference output voltage.

9.1.2 DAC Noise Performance

Output noise spectral density at the V_{OUT-n} pin versus frequency is depicted in [Figure 45](#) and [Figure 46](#) for full-scale, mid-scale, and zero-scale input codes. The typical noise density for mid-scale code is 90 nV/ $\sqrt{\text{Hz}}$ at 1 kHz. High-frequency noise can be improved by filtering the reference noise. Integrated output noise between 0.1 Hz and 10 Hz is close to 2.5 μ V_{PP} (mid-scale), as shown in [Figure 47](#).

Typical Applications (continued)

$$V_{OUT} = \frac{R_G}{2} \times \left(\frac{V_{DAC} - V_{REF}}{R_{SET}} \right) \quad (5)$$

When configured for current mode, the XTR300 routes the internal output of its current copy circuitry to the SET pin. This provides feedback for the internal OPA driver based on 1 / 10th of the output current, resulting in a voltage-to-current transfer function. Generating bipolar current outputs from the single-ended DAC output voltage, V_{DAC} , requires the application of an offset to the XTR300 SET pin. Connect the R_{SET} resistor from the SET pin to V_{REF} to apply the offset and obtain the transfer function shown in [Equation 6](#).

$$I_{OUT} = 10 \times \left(\frac{V_{DAC} - V_{REF}}{R_{SET}} \right) \quad (6)$$

The desired output ranges for V_{DAC} and V_{REF} voltages determine the R_{SET} and R_G resistor values, calculated using [Equation 7](#) and [Equation 8](#). The system design requires a V_{DAC} voltage range of 0.04 V to 4.96 V in order to operate the DAC8563 in the specified linear output range from codes 512 to 65 024.

$$R_{SET} = 10 \times \left(\frac{V_{DAC} - V_{REF}}{I_{OUT}} \right) = 10 \times \left(\frac{4.96 \text{ V} - 2.5 \text{ V}}{0.024 \text{ A}} \right) = 1025 \ \Omega \quad (7)$$

$$R_G = \frac{2 \times V_{OUT_MAX} \times R_{SET}}{V_{DAC} - V_{REF}} = \frac{2 \times 10 \text{ V} \times 1020 \ \Omega}{4.96 \text{ V} - 2.5 \text{ V}} = 8292 \ \Omega \quad (8)$$

I_{MON} and I_{A_OUT} accomplish load monitoring. The sizing of R_{IMON} and R_{IA} determine the monitoring output voltage across the resistors. Size the resistors according to [Equation 9](#) and [Equation 10](#) and the expected output load current I_{DRV} .

$$R_{IMON} = \frac{10 \times V_{IMON}}{I_{DRV}} \quad (9)$$

$$R_{IA} = \frac{10 \times V_{IA}}{I_{IA}} \quad (10)$$

For more detailed information about the design procedure of this circuit and how to isolate it, see *Two-Channel Source/Sink Combined Voltage & Current Output, Isolated, EMC/EMI Tested Reference Design (TIDU434)*.

Typical Applications (continued)

9.2.1.3 Application Curves

Figure 97 shows the transfer function for the bipolar ± 10 V voltage range. This design also supports output voltage ranges of 0–5 V, 0–10 V and ± 5 V. Figure 98 shows the transfer function for the unipolar 0–24 mA current range. This design also supports output current ranges of ± 24 mA and 4 mA–20 mA.

Typical Applications (continued)

9.2.2 Up to ±15-V Bipolar Output Using the DAC8562

The DAC8562 is designed to be operate from a single power supply providing a maximum output range of AV_{DD} volts. However, the DAC can be placed in the configuration shown in Figure 99 in order to be designed into bipolar systems. Depending on the ratio of the resistor values, the output of the circuit can range anywhere from ±5 V to ±15 V. The design example below shows that the DAC is configured to have its internal reference enabled and the DAC8562 internal gain set to 2, however, an external 2.5-V reference could also be used (with DAC8562 internal gain set to 2).

Figure 99. Bipolar Output Range Circuit Using DAC8562

The transfer function shown in Equation 5 can be used to calculate the output voltage as a function of the DAC code, reference voltage and resistor ratio:

$$V_{OUT} = G \times V_{REFOUT} \left(2 \times \frac{D_{IN}}{65,536} - 1 \right) \quad (11)$$

where:

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register, ranging from 0 to 65,535 for DAC8562 (16 bit).

V_{REFOUT} = reference output voltage with the internal reference enabled from the DAC V_{REFIN}/V_{REFOUT} pin

G = ratio of the resistors

An example configuration to generate a ±10-V output range is shown below in Equation 6 with $G = 4$ and $V_{REFOUT} = 2.5$ V:

$$V_{OUT} = 20 \times \frac{D_{IN}}{65,536} - 10 \text{ V} \quad (12)$$

In this example, the range is set to ±10 V by using a resistor ratio of four, V_{REFOUT} of 2.5 V, and DAC8562 internal gain of 2. The resistor sizes must be selected keeping in mind the current sink or source capability of the DAC8562 internal reference. Using larger resistor values, for example, $R = 10$ kΩ or larger, is recommended. The op amp is selectable depending on the requirements of the system.

The DAC8562EVM and DAC7562EVM boards have the option to evaluate the bipolar output application by installing the components on the pre-placed footprints. For more information see either the [DAC8562EVM](#) or [DAC7562EVM](#) product folder.

9.3 System Examples

9.3.1 MSP430 Microprocessor Interfacing

Figure 100 shows a serial interface between the DAC756x, DAC816x, or DAC856x device and a typical MSP430 USI port such as the one found on the MSP430F2013. The port is configured in SPI master mode by setting bits 3, 5, 6, and 7 in USICTL0. The USI counter interrupt is set in USICTL1 to provide an efficient means of SPI communication with minimal software overhead. The serial clock polarity, source, and speed are controlled by settings in the USI clock control register (USICKCTL). The SYNC signal is derived from a bit-programmable pin on port 1; in this case, port line P1.4 is used. When data are to be transmitted to the DAC756x, DAC816x, or DAC856x device, P1.4 is taken low. The USI transmits data in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P1.4 is left low after the first eight bits are transmitted; then, a second write cycle is initiated to transmit the second byte of data. P1.4 is taken high following the completion of the third write cycle.

NOTE: Additional pins omitted for clarity.

Figure 100. DAC756x, DAC816x, or DAC856x Device to MSP430 Interface

9.3.2 TMS320 McBSP Microprocessor Interfacing

Figure 101 shows an interface between the DAC756x, DAC816x, or DAC856x device and any TMS320 series DSP from Texas Instruments with a multi-channel buffered serial port (McBSP). Serial data are shifted out on the rising edge of the serial clock and are clocked into the DAC756x, DAC816x, or DAC856x device on the falling edge of the SCLK signal.

NOTE: Additional pins omitted for clarity.

Figure 101. DAC756x, DAC816x, or DAC856x Device to TMS320 McBSP Interface

9.3.3 OMAP-L1x Processor Interfacing

Figure 102 shows a serial interface between the DAC756x, DAC816x, or DAC856x device and the OMAP-L138 processor. The transmit clock CLKx0 of the L138 drives SCLK of the DAC756x, DAC816x, or DAC856x device, and the data transmit (Dx0) output drives the serial data line of the DAC. The SYNC signal is derived from the frame sync transmit (FSx0) line, similar to the TMS320 interface.

NOTE: Additional pins omitted for clarity.

Figure 102. DAC756x, DAC816x, or DAC856x Device to OMAP-L1x Processor

10 Power Supply Recommendations

These devices can operate within the specified supply voltage range of 2.7 V to 5.5 V. The power applied to AV_{DD} should be well-regulated and low-noise. In order to further minimize noise from the power supplies, a strong recommendation is to include a pair of 100-pF and 1-nF capacitors and a 0.1- μ F to 1- μ F bypass capacitor. The current consumption of the AV_{DD} pin, the short-circuit current limit, and the load current for these devices are listed in the [Electrical Characteristics](#) table. Choose the power supplies for these devices to meet the aforementioned current requirements.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. The DAC756x, DAC816x, and DAC856x devices offer single-supply operation, and are often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output. As a result of the single ground pin of the DAC756x, DAC816x, and DAC856x devices, all return currents (including digital and analog return currents for the DAC) must flow through a single point. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power-entry point of the system. The power applied to AV_{DD} should be well-regulated and low noise. Switching power supplies and dc-dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. As with the GND connection, AV_{DD} should be connected to a power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, a pair of 100-pF to 1-nF capacitors and a 0.1- μ F to 1- μ F bypass capacitor are strongly recommended. In some situations, additional bypassing may be required, such as a 100- μ F electrolytic capacitor or even a pi filter made up of inductors and capacitors – all designed essentially to provide low-pass filtering for the supply and remove the high-frequency noise.

12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.
 SPI, QSPI are trademarks of Motorola, Inc.
 All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided.  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

THERMAL PAD MECHANICAL DATA

DSC (S-PWSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

DSC (S-PWSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
