## DM74LS112A Dual Negative-Edge-Triggered Master-Slave J-K Flip-Flop with Preset, Clear, and Complementary Outputs

### General Description

This device contains two independent negative-edge-triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flop on the falling edge of the clock pulse. The clock triggering occurs at a voltage level and is not directly related to the transition time of the falling edge of the clock pulse. Data on the J and K inputs may be changed while the clock is HIGH or LOW without affecting the outputs as long as the setup and hold times are not violated. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

$Q_0$  = The output logic level before the indicated input conditions were established.

Toggle = Each output changes to the complement of its previous level on each falling edge of the clock pulse.

**Note 1:** This configuration is nonstable; that is, it will not persist when preset and/or clear inputs return to their inactive (HIGH) level.

**Absolute Maximum Ratings**(Note 2)

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	0°C to +70°C
Storage Temperature Range	-65°C to +150°C

**Note 2:** The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 6:** All typicals are at  $V_{CC} = 5\text{V}, T_A = 25^\circ\text{C}$ .

**Note 7:** Not more than one output should be shorted at a time, and the duration should not exceed one second. For devices, with feedback from the outputs, where shorting the outputs to ground may cause the outputs to change logic state an equivalent test may be performed where  $V_O = 2.125\text{V}$  with the minimum and maximum limits reduced by one half from their stated values. This is very useful when using automatic test equipment.

**Note 8:** With all outputs OPEN,  $I_{CC}$  is measured with the Q and  $\bar{Q}$  outputs HIGH in turn. At the time of measurement the clock is grounded.
