

**THE DATASHEET OF
NCP301LSN25T1**

NCP300, NCP301

Voltage Detector Series

The NCP300 and NCP301 series are second generation ultra-low current voltage detectors. These devices are specifically designed for use as reset controllers in portable microprocessor based systems where extended battery life is paramount.

Each series features a highly accurate undervoltage detector with hysteresis which prevents erratic system reset operation as the comparator threshold is crossed.

The NCP300 series consists of complementary output devices that are available with either an active high or active low reset output. The NCP301 series has an open drain N-Channel output with either an active high or active low reset output.

The NCP300 and NCP301 device series are available in the Thin TSOP-5 package with standard undervoltage thresholds. Additional thresholds that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.

Features

- Quiescent Current of 0.5 μ A Typical
- High Accuracy Undervoltage Threshold of 2.0%
- Wide Operating Voltage Range of 0.8 V to 10 V
- Complementary or Open Drain Reset Output
- Active Low or Active High Reset Output
- Specified Over the -40°C to $+125^{\circ}\text{C}$ Temperature Range (Except for Voltage Options from 0.9 to 1.1 V)
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Microprocessor Reset Controller
- Low Battery Detection
- Power Fail Indicator
- Battery Backup Detection

* The representative block diagrams depict active low reset output 'L' suffix devices. The comparator inputs are interchanged for the active high output 'H' suffix devices.

This device contains 25 active transistors.

ORDERING INFORMATION

See detailed ordering and shipping information in the ordering information section on page 21 of this data sheet.

NCP300, NCP301

MAXIMUM RATINGS

| Rating | Symbol | Value | Unit |
|---|-----------------|--------------------------------------|----------|
| Input Power Supply Voltage (Pin 2) | V_{in} | 12 | V |
| Output Voltage (Pin 1) Complementary, NCP300 N-Channel Open Drain, NCP301 | V_{OUT} | -0.3 to $V_{in} + 0.3$ -0.3 to 12 | V |
| Output Current (Pin 1) (Note 2) | I_{OUT} | 70 | mA |
| Thermal Resistance Junction-to-Air | $R_{\theta JA}$ | 250 | °C/W |
| Maximum Junction Temperature | T_J | +150 | °C |
| Operating Ambient Temperature Range All Voltage Options: 0.9 V to 1.1 V All Voltage Options: 1.2 V to 4.9 V | T_A T_A | -40 to +85 -40 to +125 | °C °C |
| Storage Temperature Range | T_{stg} | -55 to +150 | °C |
| Moisture Sensitivity Level | MSL | 1 | |
| Latchup Performance (Note 3) Positive Negative | $I_{LATCHUP}$ | 200 200 | mA |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- This device series contains ESD protection and exceeds the following tests:
Human Body Model 2000 V per MIL-STD-883, Method 3015.
Machine Model Method 200 V.
- The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

- Maximum ratings per JEDEC standard JESD78.

NCP300, NCP301

ELECTRICAL CHARACTERISTICS (For all values $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, unless otherwise noted.)

| Characteristic | Symbol | Min | Typ | Max | Unit |
|---|--|------------------------|---------------------|----------------------|---------------|

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NCP300, NCP301

NCP300 and NCP301 series are measured with a 10 pF capacitive load. NCP301 has an additional 470 k pull-up resistor connected from the reset output to +5.0 V. The reset output voltage waveforms are shown for the active low 'L' devices. The upper detector threshold, V_{DET+} is the sum of the lower detector threshold, V_{DET-} plus the input hysteresis, V_{HYS} .

OPERATING DESCRIPTION

The NCP300 and NCP301 series devices are second generation ultra-low current voltage detectors. Figures 20 and 21 show a timing diagram and a typical application. Initially consider that input voltage V_{in} is at a nominal level and it is greater than the voltage detector upper threshold (V_{DET+}), and the reset output (Pin 1) will be in the high state for active low devices, or in the low state for active high devices. If there is a power interruption and V_{in} becomes significantly deficient, it will fall below the lower detector threshold (V_{DET-}). This sequence of events causes the Reset output to be in the low state for active low devices, or in the

high state for active high devices. After completion of the power interruption, V_{in} will again return to its nominal level and become greater than the V_{DET+} . The voltage detector has built-in hysteresis to prevent erratic reset operation as the comparator threshold is crossed.

Although these device series are specifically designed for use as reset controllers in portable microprocessor based systems, they offer a cost-effective solution in numerous applications where precise voltage monitoring is required. Figure 26 through Figure 33 shows various application examples.

Figure 21. Timing Waveforms

V_{CC} TRANSIENT REJECTION

The NCP300 and NCP301 series provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative glitches on the power supply line. Figure 22 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive which lies under the curve will not generate a reset signal. A below-V_{CC} condition (on the right) is detected as a brownout or power-down. Typically, any transient that goes 100 mV below the reset threshold and lasts 5.0 μs or less will not cause a reset pulse.

Transient immunity can be improved by adding a capacitor in close proximity to the V_{CC} pin of the NCP30x.

Figure 22. Max Transient Duration vs. Max Overdrive

Figure 23.

FACTORS TO BE CONSIDERED FOR VOLTAGE OPTION SELECTION

The following hysteresis graph depicts V_{DET-_{min/max}} and V_{DET+_{min/max}} for an active low Reset device:

Figure 24.

For selecting a voltage option in the NCP30X family, three major factors should be considered:

1. V_{DET+_{max}}: Maximum detector threshold voltage for increasing V_{in} for the NCP30X device.
2. V_{in_{min}}: Minimum voltage output of the power supply. This is also the input voltage to the NCP30X device.
3. V_{CC_{min}}: Minimum power supply voltage specification for the device that is protected by the NCP30X.

The V_{DET+_{max}} for an NCP30X device is normally calculated as follows:

$$V_{DET+_{max}} = V_{DET-_{max}} + V_{HYS_{max}} \quad (\text{eq. 1})$$

Where:

V_{DET-_{max}} = Maximum detector threshold voltage for decreasing V_{in}

V_{HYS_{max}} = Maximum detector threshold hysteresis

The above two parameters can be obtained directly from the data sheet to figure out the V_{DET+_{max}}.

In the NCP30X family, for a given V_{DET-_{typ}}, which is the typical detection voltage reflected in the part number, the threshold values are designed to the following targets (at 25°C):

$$V_{DET-_{min}} = V_{DET-_{typ}} - 2\% \quad (\text{eq. 2})$$

$$V_{DET-_{max}} = V_{DET-_{typ}} + 2\% \quad (\text{eq. 3})$$

$$V_{HYS_{typ}} = 5\% \text{ of } V_{DET-_{typ}} \quad (\text{eq. 4})$$

$$V_{HYS_{min}} = V_{HYS_{typ}} - 40\% \quad (\text{eq. 5})$$

$$V_{HYS_{max}} = V_{HYS_{typ}} + 40\% \quad (\text{eq. 6})$$

By simple mathematical calculation, combining Equations 2 to 6, Equation 1 becomes:

$$V_{DET+_{max}} = V_{DET-_{typ}} \times 1.09 \quad (\text{eq. 7})$$

NCP300, NCP301

So, $V_{DET+_{max}}$ can be easily figured out just using a single variable $V_{DET-_{typ}}$.

For example, for NCP300LSN18T1G $V_{DET-_{typ}} = 1.8$ V; then

$$V_{DET+_{max}} = 1.8 \times 1.09 = 1.962 \text{ V} \quad (\text{eq. 8})$$

The NCP30X detection voltage option must be chosen such that:

$$V_{CC_{min}} < V_{DET+_{max}} < V_{in_{min}} \quad (\text{eq. 9})$$

The significance of $V_{CC_{min}} < V_{DET+_{max}}$ is that it makes sure the the reset from NCP30X remains asserted (in RESET hold state) till after the power supply exceeds the $V_{CC_{min}}$ requirement; this prevents incorrect device (uP) initiation.

Having $V_{DET+_{max}} < V_{in_{min}}$ makes sure that the NCP30X is able to start up when V_{in} is at the $V_{in_{min}}$.

The theoretical ideal $V_{DET-_{typ}}$ voltage option to be selected by the user, $V_{DET-_{typ_{ideal}}}$, can be given by the following formula:

$$V_{DET-_{typ_{ideal}}} = \frac{(V_{in_{min}} + V_{CC_{min}})}{(2 \times 1.09)} \quad (\text{eq. 10})$$

The following example shows how to select the device voltage option in a real world application.

1. Power supply output specification: 3.3 V \pm 3%
2. Microprocessor core voltage specification: 3.3 V \pm 5%

So, we have:

$$V_{in_{min}} = 3.3 \text{ V} - 3\% = 3.201 \text{ V} \quad (\text{eq. 11})$$

$$V_{CC_{min}} = 3.3 \text{ V} - 5\% = 3.135 \text{ V} \quad (\text{eq. 12})$$

Then the ideal voltage option = $(3.201 + 3.135) / (2 * 1.09) = 2.9064$ V

Therefore, a device voltage option of 2.9 V will be the right choice.

PROPAGATION DELAY VARIATION

On the other hand (see above paragraph), a minimum overdrive value from $V_{threshold}$ to V_{CC} must be respected. That means V_{in} (minimum value of V_{CC}) must be higher enough than V_{DET+} (V_{DET-} + hysteresis) at the risk of significantly increasing propagation delay. (Figure 25) This propagation delay is temperature sensitive.

To avoid acceptable time response, a minimum 100 mV difference between V_{in} and V_{DET+} must be selected.

NCP300, NCP301

APPLICATION CIRCUIT INFORMATION

Figure 29. Dual Power Supply Undervoltage Supervision

Figure 30. Microprocessor Reset Circuit with Additional Hysteresis

Comparator hysteresis can be increased with the addition of resistor R_H . The hysteresis equations have been simplified and do not account for the change of input current I_{in} as V_{in} crosses the comparator threshold. The internal resistance, R_{in} is simply calculated using $I_{in} = 0.26 \mu A$ at 2.6 V.

V_{in} Decreasing:

$$V_{th} = \left(\frac{R_H}{R_{in}} + 1 \right) (V_{DET-})$$

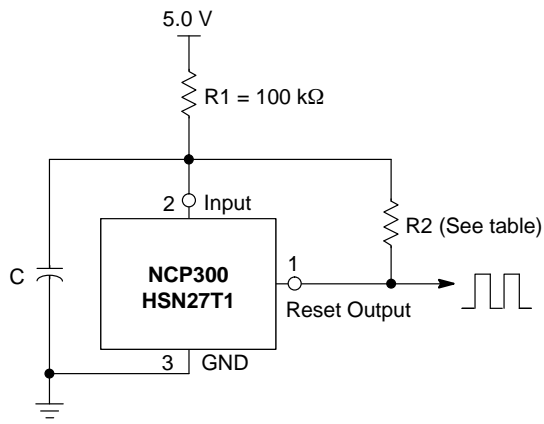

V_{in} Increasing:

$$V_{th} = \left(\frac{R_H}{R_{in} \parallel R_L} + 1 \right) (V_{DET-} + V_{HYS})$$

$$V_{HYS} = V_{in \text{ Increasing}} - V_{in \text{ Decreasing}}$$

| Test Data | | | | |

Figure 31. Simple Clock Oscillator

This circuit monitors the current at the load. As current flows through the load, a voltage drop with respect to ground appears across R_{sense} where $V_{sense} = I_{load} * R_{sense}$. The following conditions apply:

If:
 $I_{Load} < V_{DET-} / R_{sense}$
 $I_{Load} \geq (V_{DET-} + V_{HYS}) / R_{sense}$

Then:
 Reset Output = 0 V
 Reset Output = V_{DD}

Figure 32. Microcontroller System Load Sensing

NCP300, NCP301

A simple voltage monitor can be constructed by connecting several voltage detectors as shown above. Each LED will sequentially turn on when the respective voltage detector threshold ($V_{DET-} + V_{HYS}$) is exceeded. Note that detector thresholds (V_{DET-}) that range from 0.9 V to 4.9 V in 100 mV steps can be manufactured.
