

# THE DATASHEET OF DAC7632VFT

# 16-Bit, Dual Voltage Output DIGITAL-TO-ANALOG CONVERTER

## FEATURES

- **LOW POWER:** 4mW
- **UNIPOLAR OR BIPOLAR OPERATION**
- **SETTLING TIME:** 10 $\mu$ s to  $\pm 0.003\%$  FSR
- **15-BIT LINEARITY AND MONOTONICITY:**  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- **PROGRAMMABLE RESET TO MID-SCALE OR ZERO-SCALE**
- **DOUBLE-BUFFERED DATA INPUTS**

## APPLICATIONS

- **PROCESS CONTROL**
- **CLOSED-LOOP SERVO-CONTROL**
- **MOTOR CONTROL**
- **DATA ACQUISITION SYSTEMS**
- **DAC-PER-PIN PROGRAMMERS**

## DESCRIPTION

The DAC7632 is a 16-bit, dual channel, voltage output, Digital-to-Analog Converter (DAC) which provides 15-bit monotonic performance over the specified temperature range. The device accepts 24-bit serial input data, has double-buffered DAC input logic (allowing simultaneous update of both DACs), and provides a serial data output for daisy-chaining multiple devices. A programmable asynchronous reset clears all registers to a mid-scale code of 8000<sub>H</sub> or to a zero-scale code of 0000<sub>H</sub>. The DAC7632 can operate from a single +5V supply or from +5V and  $-5\text{V}$  supplies, providing an output range of 0V to +2.5V or  $-2.5\text{V}$  to +2.5V, respectively.

Low power and small size per DAC make the DAC7632 ideal for industrial process control, data acquisition systems, and closed-loop servo-control. The DAC7632 is available in an LQFP-32 package and specified over a  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  temperature range.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

$V_{CC}$ and $V_{DD}$ to $V_{SS}$ .....	-0.3V to 11V
$V_{CC}$ and $V_{DD}$ to GND .....	-0.3V to 5.5V
$V_{REFL}$ to $V_{SS}$ .....	-0.3V to ( $V_{CC} - V_{SS}$ )
$V_{CC}$ to $V_{REFH}$ .....	-0.3V to ( $V_{CC} - V_{SS}$ )
$V_{REFH}$ to $V_{REFL}$ .....	-0.3V to ( $V_{CC} - V_{SS}$ )
Digital Input Voltage to GND .....	-0.3V to $V_{DD} + 0.3V$
Digital Output Voltage to GND .....	-0.3V to $V_{DD} + 0.3V$
Maximum Junction Temperature .....	+150°C
Operating Temperature Range .....	-40°C to +85°C
Storage Temperature Range .....	-65°C to +125°C
Lead Temperature (soldering, 10s) .....	+300°C

NOTE: (1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE/ORDERING INFORMATION<sup>(1)</sup>

## THEORY OF OPERATION

The DAC7632 is a dual channel, voltage output, 16-bit DAC. The architecture is an R-2R ladder configuration with the three MSB's segmented, followed by an operational amplifier that serves as a buffer. Each DAC has its own R-2R ladder network, segmented MSBs, and output op amp, as shown in Figure 1. The minimum voltage output (zero-scale) and maximum voltage output (full-scale) are set by the external voltage references  $V_{REFL}$  and  $V_{REFH}$ , respectively.

The digital input is a 24-bit serial word that contains an address bit for selecting one of two DACs, a quick load bit, six unused bits, and the 16-bit DAC code (MSB first). The converters can be powered from either a single +5V supply or a dual  $\pm 5V$  supply. The device offers a reset function which immediately sets all DAC output voltages, DAC registers and input registers to mid-scale (code  $8000_H$ ) or to zero-scale (code  $0000_H$ ), depending on the state of RSTSEL. See Figures 2 and 3 for the basic configurations of the DAC7632.

FIGURE 1. DAC7632 Architecture.

FIGURE 2. Basic Single-Supply Operation of the DAC7632.

FIGURE 3. Basic Dual-Supply Operation of the DAC7632.

## ANALOG OUTPUTS

When  $V_{SS} = -5V$  (dual-supply operation), the output amplifier can swing to within 2.25V of the supply rails over the  $-40^{\circ}C$  to  $+85^{\circ}C$  temperature range. When  $V_{SS} = 0V$  (single-supply operation), and with  $R_{LOAD}$  also connected to ground, the output can swing to ground. Care must also be taken when measuring the zero-scale error when  $V_{SS} = 0V$ . Since the output cannot swing below ground, the output voltage may not change for the first few digital input codes (0000<sub>H</sub>, 0001<sub>H</sub>, 0002<sub>H</sub>, etc.) if the output amplifier has a negative offset. At the negative limit of  $-2mV$ , the first specified output starts at code 0040<sub>H</sub>.

Due to the high accuracy of these DACs, system design problems such as grounding and contact resistance become very important. A 16-bit converter with a 2.5V full-scale range has a 1LSB value of  $38\mu V$ . With a load current of 1mA, series wiring and connector resistance of only  $40m\Omega$  ( $R_{W2}$ ) will cause a voltage drop of  $40\mu V$ , as shown in Figure 4. To understand what this means in terms of a system layout, the resistivity of a typical 1 ounce copper-clad printed circuit board is  $1/2m\Omega$  per square. For a 1mA load, a 10 milli-inch wide printed circuit conductor 600 milli-inches long will result in a voltage drop of  $30\mu V$ .

The DAC7632 offers a force and sense output configuration for the high open-loop gain output amplifier. This feature allows the loop around the output amplifier to be closed at the load, as shown in Figure 4, thus ensuring an accurate output voltage.

## REFERENCE INPUTS

The reference inputs,  $V_{REFL}$  and  $V_{REFH}$ , can be any voltage between  $V_{SS} + 2.5V$  and  $V_{CC} - 2.5V$ , provided that  $V_{REFH}$  is at least 1.25V greater than  $V_{REFL}$ . The minimum output of each DAC is equal to  $V_{REFL}$  plus a small offset voltage (essentially, the offset of the output op amp). The maximum output is equal to  $V_{REFH}$  plus a similar offset voltage. Note

FIGURE 4. Analog Output Closed-Loop Configuration  
 $R_W$  represents wiring resistances.

that  $V_{SS}$  (the negative power supply) must either be connected to ground or must be in the range of  $-4.75V$  to  $-5.25V$ . The voltage on  $V_{SS}$  sets several bias points within the converter. If  $V_{SS}$  is not in one of these two configurations, the bias values may be in error and proper operation of the device may be affected.

The current into the  $V_{REFH}$  input and out of  $V_{REFL}$  depends on the DAC output voltages, and can vary from a few microamps to approximately 0.5mA. The reference input appears as a varying load to the reference supply. If the reference applied can sink or source the required current, a reference buffer is not required. The DAC7632 features reference drive and sense connections such that the internal errors caused by the changing reference current and the circuit impedances can be minimized. Figures 5 through 13 show different reference configurations and the effect on the integral linearity and differential linearity, for each case.

## DIGITAL INTERFACE

See Table I for the basic control logic for the DAC7632. The interface consists of a Serial Data Clock (CLK) input, Serial Data Input (SDI), Input Register Load Control Signal ( $\overline{LOAD}$ ), and DAC Register Load Control Signal (LDAC). In addition, a Chip Select ( $\overline{CS}$ ) input is available to enable serial communication when there are multiple serial devices attached to a single serial bus. An asynchronous Reset (RST) input (rising edge triggered) is provided to simplify start-up conditions, periodic resets, or emergency resets to a known state, depending on the status of the Reset Select (RSTSEL) signal.

The DAC code, quick load control, and address are provided via a 24-bit serial interface (see Figure 15). The first bit (DACSEL) selects the input register that will be updated when  $\overline{LOAD}$  goes LOW. The third bit is a "Quick Load" bit such that if HIGH, the code in the shift register is loaded into both input registers when the  $\overline{LOAD}$  signal goes LOW. If the "Quick Load" bit is LOW when an active  $\overline{LOAD}$  signal is issued, the content of the shift register is loaded only to the input register that is addressed by DACSEL. The "Quick Load" bit is followed by five unused bits. The last 16 bits (MSB first) make up the DAC code.

TABLE I. DAC7632 Logic Truth Table.

Data presented to SDI is clocked into the shift register on each rising CLK edge. This data is latched into the input register(s) via a logic-low level on  $\overline{\text{LOAD}}$ . The data is directed from the shift register to the desired input register(s) specified by data bits 21 and 23. The internal DAC registers are edge triggered and not level triggered. When the LDAC signal is transitioned from LOW to HIGH, the digital word currently in the input registers are latched. This double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs. When the new data has been entered into the device, both DAC outputs can be updated simultaneously by the rising edge of LDAC. Additionally, it allows the input registers to be written to at any point, then the DAC output voltages can be synchronously changed via a trigger signal (LDAC).

Note that  $\overline{\text{CS}}$  and CLK are combined with an OR gate, which controls the serial-to-parallel shift register. These two inputs are completely interchangeable. In addition, care must be taken with the state of CLK when  $\overline{\text{CS}}$  rises at the end of a serial transfer. If CLK is LOW when  $\overline{\text{CS}}$  rises, the OR gate will provide a rising edge to the shift register, shifting the internal data one additional bit. The result will be incorrect data and possible selection of the wrong input register(s). If both  $\overline{\text{CS}}$  and CLK are used,  $\overline{\text{CS}}$  should rise only when CLK is HIGH. If not, then either  $\overline{\text{CS}}$  or CLK can be used to operate the shift register (the remaining pin should be tied to DGND). Please refer to Table II for more information.

$\overline{\text{CS}}^{(1)}$	CLK <sup>(1)</sup>	$\overline{\text{LOAD}}$	RST	SERIAL SHIFT REGISTER
H <sup>(2)</sup>	X <sup>(3)</sup>	H	H	No Change
L <sup>(4)</sup>	L	H	H	No Change
L	↑ <sup>(5)</sup>	H	H	Advanced One Bit
↑	L	H	H	Advanced One Bit
H <sup>(6)</sup>	X	L <sup>(7)</sup>	H	No Change
H <sup>(6)</sup>	X	H	↑ <sup>(8)</sup>	No Change

NOTES: (1)  $\overline{\text{CS}}$  and CLK are interchangeable. (2) H = Logic HIGH. (3) X = Don't Care. (4) L = Logic LOW. (5) = Positive Logic Transition. (6) A HIGH value is suggested in order to avoid a "false clock" from advancing the shift register and changing the shift register. (7) If data is clocked into the serial register while  $\overline{\text{LOAD}}$  is LOW, the input registers will change as data flows through the shift register. This will corrupt the data in each DAC register that has been erroneously selected. (8) Rising edge of RST causes no change in the contents of the serial shift register.

TABLE II. Serial Shift Register Truth Table.

## SERIAL-DATA OUTPUT

The Serial-Data Output pin (SDO) is the internal shift register's output. For the DAC7632, SDO is a driven output and does not require an external pull-up. Any number of DAC7632s can be daisy-chained by connecting the SDO pin of one device to the SDI pin of the following device in the chain, as shown in Figure 14.

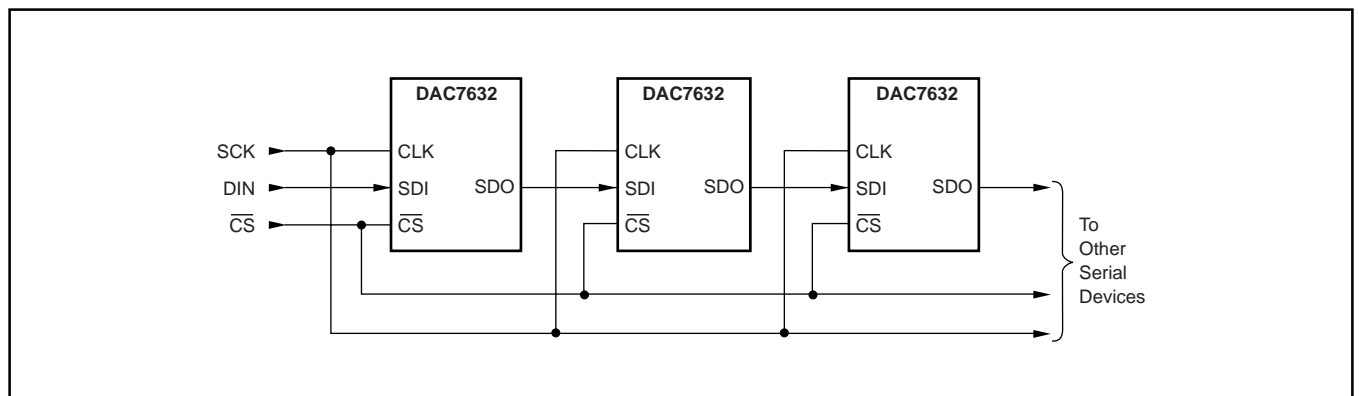

FIGURE 14. Daisy-Chaining Multiple DAC7632s.

## DIGITAL TIMING

Figure 15 and Table III provide detailed timing for the digital interface of the DAC7632.

## DIGITAL INPUT CODING

The DAC7632 input data is in Straight Binary format. The output voltage is given by Equation 1.

$$V_{OUT} = V_{REFL} + \frac{(V_{REFH} - V_{REFL}) \cdot N}{65,536}$$

where N is the digital input code. This equation does not include the effects of offset (zero-scale) or gain (full-scale) errors.

## DIGITALLY-PROGRAMMABLE CURRENT SOURCE

The DAC7632 offers a unique set of features that allows a wide range of flexibility in designing application circuits such as programmable current sources. The DAC7632 offers both a differential reference input, as well as an open-loop configuration around the output amplifier. The open-loop configuration around the output amplifier allows a transistor to be placed within the loop to implement a digitally-programmable, unidirectional current source. The availability of a differential reference allows programmability for both the full-scale and zero-scale currents. The output current is calculated as:

$$I_{OUT} = \left( \left( \frac{V_{REFH} - V_{REFL}}{R_{SENSE}} \right) \cdot \left( \frac{N}{65,536} \right) \right) + (V_{REFL} / R_{SENSE})$$

FIGURE 15. Digital Input and Output Timing.

SYMBOL	DESCRIPTION	MIN	MAX	UNITS
t <sub>DS</sub>	Data Valid to CLK Rising	10		ns
t <sub>DH</sub>	Data Held Valid after CLK Rises	20		ns
t <sub>CH</sub>	CLK HIGH	25		ns
t <sub>CL</sub>	CLK LOW	25		ns
t <sub>CSS</sub>	$\overline{\text{CS}}$ LOW to CLK Rising	15		ns
t <sub>CSH</sub>	CLK HIGH to $\overline{\text{CS}}$ Rising	0		ns
t <sub>LD1</sub>	$\overline{\text{LOAD}}$ HIGH to CLK Rising	10		ns
t <sub>LD2</sub>	CLK Rising to $\overline{\text{LOAD}}$ LOW	30		ns
t <sub>LDRW</sub>	$\overline{\text{LOAD}}$ LOW Time	30		ns
t <sub>LDDL</sub>	LDAC LOW Time	100		ns
t <sub>LDDH</sub>	LDAC HIGH Time	100		ns
t <sub>LDDD</sub>	$\overline{\text{LOAD}}$ LOW to LDAC Rising	40		ns
t <sub>RSSS</sub>	RESETSEL Valid to RESET HIGH	0		ns
t <sub>RSSH</sub>	RESET HIGH to RESETSEL Not Valid	100		ns
t <sub>RSTL</sub>	RESET LOW Time	10		ns
t <sub>RSTH</sub>	RESET HIGH Time	10		ns
t <sub>SDO</sub>	SDO Propagation Delay	10	30	ns
t <sub>S</sub>	Settling Time		10	$\mu$ s

TABLE III. Timing Specifications ( $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ ).

Figure 16 shows a DAC7632 in a 4-20mA current output configuration. The output current can be determined by Equation 3:

$$I_{\text{OUT}} = \left( \left( \frac{2.5\text{V} - 0.5\text{V}}{125\Omega} \right) \cdot \left( \frac{N}{65,536} \right) \right) + \left( \frac{0.5\text{V}}{125\Omega} \right)$$

At full-scale, the output current is 16mA, plus the 4mA, for the zero current. At zero scale the output current is the offset current of 4mA ( $0.5\text{V}/125\Omega$ ).

FIGURE 16. 4-20mA Digitally-Controlled Current Source.

## Revision History

DATE	REVISION	PAGE	SECTION	DESCRIPTION
4/08	A	—	Entire Data Sheet	Updated document format.
		4	Electrical Characteristics	Changed section title from "Dual Supply" to "Single Supply" (typo).
		13	Figures 2, 3	Updated text in figures to correct names (typo).

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC7632VFBT	ACTIVE	LQFP	VF	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC7632 B	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION
