

**THE DATASHEET OF  
DG403DY-T1**

## Low-Power, High-Speed CMOS Analog Switches

### DESCRIPTION

The DG401, DG403, DG405 monolithic analog switches were designed to provide precision, high performance switching of analog signals. Combining low power (0.35  $\mu$ W, typ.) with high speed ( $t_{ON}$ : 75 ns, typ.), the DG401 series is ideally suited for portable and battery powered industrial and military applications.

Built on the Vishay Siliconix proprietary high-voltage silicon-gate process to achieve high voltage rating and superior switch on/off performance, break-before-make is guaranteed for the SPDT configurations. An epitaxial layer prevents latchup.

Each switch conducts equally well in both directions when on, and blocks up to 30 V peak-to-peak when off. On-resistance is very flat over the full  $\pm 15$  V analog range, rivaling JFET performance without the inherent dynamic range limitations.

The three devices in this series are differentiated by the type of switch action as shown in the functional block diagrams.

### FEATURES

- 44 V supply max. rating
- $\pm 15$  V analog signal range
- On-resistance -  $R_{DS(on)}$ : 30  $\Omega$
- Low leakage -  $I_{D(on)}$ : 40 pA
- Fast switching -  $t_{ON}$ : 75 ns
- Ultra low power requirements -  $P_D$ : 0.35  $\mu$ W
- TTL, CMOS compatible
- Single supply capability
- **Compliant to RoHS directive 2002/95/EC**

**RoHS\***  
COMPLIANT

### BENEFITS

- Wide dynamic range
- Break-before-make switching action
- Simple interfacing

### APPLICATIONS

- Audio and video switching
- Sample-and-hold circuits
- Battery operation
- Test equipment
- Communications systems
- PBX, PABX

### FUNCTIONAL BLOCK DIAGRAM AND PIN CONFIGURATION

Two SPST Switches per Package

<b>ABSOLUTE MAXIMUM RATINGS</b>			
Parameter	Limit	Unit	
V+ to V-	44	V	
GND to V-	25		
V <sub>L</sub>	(GND - 0.3) to (V+) + 0.3		
Digital Inputs <sup>a</sup> , V <sub>S</sub> , V <sub>D</sub>	(V-) - 2 to (V+) + 2 or 30 mA, whichever occurs first		
Current (Any Terminal) Continuous	30	mA	
Current, S or D (Pulsed 1 ms, 10 % Duty)	100		
Storage Temperature	(DJ, DY Suffix) - 65 to 125	°C	
Power Dissipation (Package) <sup>b</sup>	16-Pin Plastic DIP <sup>c</sup>	450	mW
	16-Pin SOIC <sup>d</sup>	600	

## Notes:

- Signals on S<sub>x</sub>, D<sub>x</sub>, or IN<sub>x</sub> exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
- All leads welded or soldered to PC board.
- Derate 6 mW/°C above 75 °C.
- Derate 7.6 mW/°C above 75 °C.

Notes:

- Refer to PROCESS OPTION FLOWCHART.
- Room = 25 °C, Full = as determined by the operating temperature suffix.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this datasheet.
- Guaranteed by design, not subject to production test.
- V<sub>IN</sub> = input voltage to perform proper function.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## TYPICAL CHARACTERISTICS 25 °C, unless otherwise noted

### TEST CIRCUITS

$V_O$  is the steady state output with the switch on. Feedthrough via switch capacitance may result in spikes at the leading and trailing edge of the output waveform.

$C_L$  (includes fixture and stray capacitance)

$$V_O = V_S \frac{R_L}{R_L + r_{DS(on)}}$$

\*  $V_S = 10\text{ V}$  for  $t_{ON}$ ,  $V_S = -10\text{ V}$  for  $t_{OFF}$

Note: Logic input waveform is inverted for switches that have the opposite logic sense control

## APPLICATIONS

Figure 9. Stereo Source Selector

Figure 10. Dual Slope Integrator

### Dual Slope Integrators:

The DG403 is well suited to configure a selectable slope integrator. One control signal selects the timing capacitor  $C_1$  or  $C_2$ . Another one selects  $e_{in}$  or discharges the capacitor in preparation for the next integration cycle.

### Band-Pass Switched Capacitor Filter:

Single-pole double-throw switches are a common element for switched capacitor networks and filters. The fast switching times and low leakage of the DG403 allow for higher clock rates and consequently higher filter operating frequencies.

Figure 11. Band-Pass Switched Capacitor Filter

**APPLICATIONS**
**Peak Detector:**

$A_3$  acting as a comparator provides the logic drive for operating  $SW_1$ . The output of  $A_2$  is fed back to  $A_3$  and compared to the analog input  $e_{in}$ . If  $e_{in} > e_{out}$  the output of  $A_3$  is high keeping  $SW_1$  closed. This allows  $C_1$  to charge up to

the analog input voltage. When  $e_{in}$  goes below  $e_{out}$   $A_3$  goes negative, turning  $SW_1$  off. The system will therefore store the most positive analog input experienced.

**Figure 12. Positive Peak Detector**

*Vishay Siliconix maintains worldwide manufacturing capability. Products may be manufactured at one of several qualified locations. Reliability data for Silicon Technology and Package Reliability represent a composite of all qualified locations.
