

**THE DATASHEET OF
TMS320F28023PTS**

TMS320F2802x Microcontrollers

1 Features

- High-efficiency 32-bit CPU (TMS320C28x)
 - 60 MHz (16.67-ns cycle time)
 - 50 MHz (20-ns cycle time)
 - 40 MHz (25-ns cycle time)
 - 16 × 16 and 32 × 32 MAC operations
 - 16 × 16 dual MAC
 - Harvard bus architecture
 - Atomic operations
 - Fast interrupt response and processing
 - Unified memory programming model
 - Code-efficient (in C/C++ and Assembly)
- Endianness: Little endian
- Low cost for both device and system:
 - Single 3.3-V supply
 - No power sequencing requirement
 - Integrated power-on and brown-out resets
 - Small packaging, as low as 38-pin available
 - Low power
 - No analog support pins
- Clocking:
 - Two internal zero-pin oscillators
 - On-chip crystal oscillator and external clock input
 - Watchdog timer module
 - Missing clock detection circuitry
- Up to 22 individually programmable, multiplexed GPIO pins with input filtering
- Peripheral Interrupt Expansion (PIE) block that supports all peripheral interrupts
- Three 32-bit CPU timers
- Independent 16-bit timer in each Enhanced Pulse Width Modulator (ePWM)
- On-chip memory
 - Flash, SARAM, OTP, Boot ROM available
- Code-security module
- 128-bit security key and lock
 - Protects secure memory blocks
 - Prevents firmware reverse engineering
- Serial port peripherals
 - One Serial Communications Interface (SCI) Universal Asynchronous Receiver/Transmitter (UART) module
 - One Serial Peripheral Interface (SPI) module
 - One Inter-Integrated-Circuit (I2C) module
- Enhanced control peripherals
 - ePWM
 - High-Resolution PWM (HRPWM)
 - Enhanced Capture (eCAP) module
 - Analog-to-Digital Converter (ADC)
 - On-chip temperature sensor
 - Comparator
- Advanced emulation features
 - Analysis and breakpoint functions
 - Real-time debug through hardware
- Package options
 - 38-pin DA Thin Shrink Small-Outline Package (TSSOP)
 - 48-pin PT Low-Profile Quad Flatpack (LQFP)
- Temperature options
 - T: –40°C to 105°C
 - S: –40°C to 125°C
 - Q: –40°C to 125°C (AEC Q100 qualification for automotive applications)

2 Applications

- [Air conditioner outdoor unit](#)
- [Inverter & motor control](#)
- [Textile machine](#)
- [Micro inverter](#)
- [AC drive power stage module](#)
- [AC-input BLDC motor drive](#)
- [DC-input BLDC motor drive](#)
- [Industrial AC-DC](#)
- [Three phase UPS](#)
- [Merchant DC/DC](#)
- [Merchant network & server PSU](#)
- [Merchant telecom rectifiers](#)

3 Description

C2000™ 32-bit microcontrollers are optimized for processing, sensing, and actuation to improve closed-loop performance in real-time control applications such as industrial motor drives; solar inverters and digital power; electrical vehicles and transportation; motor control; and sensing and signal processing. The C2000 line includes the Premium performance MCUs and the Entry performance MCUs.

The F2802x family of microcontrollers provides the power of the C28x core coupled with highly integrated control peripherals in low pin-count devices. This family is code-compatible with previous C28x-based code, and also provides a high level of analog integration.

An internal voltage regulator allows for single-rail operation. Enhancements have been made to the HRPWM to allow for dual-edge control (frequency modulation). Analog comparators with internal 10-bit references have been added and can be routed directly to control the PWM outputs. The ADC converts from 0 to 3.3-V fixed full-scale range and supports ratio-metric V_{REFHI}/V_{REFLO} references. The ADC interface has been optimized for low overhead and latency.

To learn more about the C2000 MCUs, visit the C2000 Overview at www.ti.com/c2000.

Device Information

- (1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the [C2000 Real-Time Control Peripherals Reference Guide](#) and in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).
- (2) TMS320F28027F and TMS320F28026F are InstaSPIN-FOC™-enabled MCUs. For more information, see [Section 11.3](#) for a list of InstaSPIN Technical Reference Manuals.
- (3) The letter Q refers to AEC Q100 qualification for automotive applications.

6.1 Related Products

For information about similar products, see the following links:

[TMS320F2802x Microcontrollers](#)

The F2802x series offers the lowest pin-count and Flash memory size options. [InstaSPIN-FOC™](#) versions are available.

[TMS320F2803x Microcontrollers](#)

The F2803x series increases the pin-count and memory size options. The F2803x series also introduces the parallel control law accelerator (CLA) option.

[TMS320F2805x Microcontrollers](#)

The F2805x series is similar to the F2803x series but adds on-chip programmable gain amplifiers (PGAs). InstaSPIN-FOC and [InstaSPIN-MOTION™](#) versions are available.

[TMS320F2806x Microcontrollers](#)

The F2806x series is the first to include a floating-point unit (FPU). The F2806x series also increases the pin-count, memory size options, and the quantity of peripherals. InstaSPIN-FOC™ and InstaSPIN-MOTION™ versions are available.

[TMS320F2807x Microcontrollers](#)

The F2807x series offers the most performance, largest pin counts, flash memory sizes, and peripheral options. The F2807x series includes the latest generation of accelerators, ePWM peripherals, and analog technology.

[TMS320F28004x Microcontrollers](#)

The F28004x series is a reduced version of the F2807x series with the latest generational enhancements. The F28004x series is the best roadmap option for those using the F2806x series. InstaSPIN-FOC and configurable logic block (CLB) versions are available.

7 Terminal Configuration and Functions

7.1 Pin Diagrams

Figure 7-1 shows the 48-pin PT low-profile quad flatpack (LQFP) pin assignments. Figure 7-2 shows the 38-pin DA thin shrink small-outline package (TSSOP) pin assignments.

Figure 7-1. 2802x 48-Pin PT LQFP (Top View)

Figure 7-2. 2802x 38-Pin DA TSSOP (Top View)

7.2 Signal Descriptions

Section 7.2.1 describes the signals. With the exception of the JTAG pins, the GPIO function is the default at reset, unless otherwise mentioned. The peripheral signals that are listed under them are alternate functions. Some peripheral functions may not be available in all devices. See Table 6-1 for details. Inputs are not 5-V tolerant. All GPIO pins are I/O/Z and have an internal pullup, which can be selectively enabled/disabled on a per-pin basis. This feature only applies to the GPIO pins. The pullups on the PWM pins are not enabled at reset. The pullups on other GPIO pins are enabled upon reset. The AIO pins do not have an internal pullup.

Note

When the on-chip VREG is used, the GPIO19, GPIO34, GPIO35, GPIO36, GPIO37, and GPIO38 pins could glitch during power up. This potential glitch will finish before the boot mode pins are read and will not affect boot behavior. If glitching is unacceptable in an application, 1.8 V could be supplied externally. Alternatively, adding a current-limiting resistor (for example, 470 Ω) in series with these pins and any external driver could be considered to limit the potential for degradation to the pin and/or external circuitry. There is no power-sequencing requirement when using an external 1.8-V supply. However, if the 3.3-V transistors in the level-shifting output buffers of the I/O pins are powered before the 1.8-V transistors, it is possible for the output buffers to turn on, causing a glitch to occur on the pin during power up. To avoid this behavior, power the V_{DD} pins before or with the V_{DDIO} pins, ensuring that the V_{DD} pins have reached 0.7 V before the V_{DDIO} pins reach 0.7 V.

7.2.1 Signal Descriptions

TERMINAL			I/O/Z	DESCRIPTION
NAME ⁽¹⁾	PT PIN NO.	DA PIN NO.		
JTAG				
TRST	2	16	I	JTAG test reset with internal pulldown. TRST, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. NOTE: TRST is an active high test pin and must be maintained low at all times during normal device operation. An external pulldown resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-kΩ resistor generally offers adequate protection. Because this is application-specific, TI recommends validating each target board for proper operation of the debugger and the application. (↓)
TCK	See GPIO38		I	See GPIO38. JTAG test clock with internal pullup (↑)
TMS	See GPIO36		I	See GPIO36. JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. (↑)
TDI	See GPIO35		I	See GPIO35. JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. (↑)
TDO	See GPIO37		O/Z	See GPIO37. JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. (8-mA drive)
FLASH				
TEST	30	38	I/O	Test Pin. Reserved for TI. Must be left unconnected.

TERMINAL			I/O/Z	DESCRIPTION
NAME ⁽¹⁾	PT PIN NO.	DA PIN NO.		
CLOCK				
XCLKOUT	See GPIO18		O/Z	See GPIO18. Output clock derived from SYSCLKOUT. XCLKOUT is either the same frequency, one-half the frequency, or one-fourth the frequency of SYSCLKOUT. This is controlled by bits 1:0 (XCLKOUTDIV) in the XCLK register. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting XCLKOUTDIV to 3. The mux control for GPIO18 must also be set to XCLKOUT for this signal to propagate to the pin.
XCLKIN	See GPIO19 and GPIO38		I	See GPIO19 and GPIO38. External oscillator input. Pin source for the clock is controlled by the XCLKINSEL bit in the XCLK register, GPIO38 is the default selection. This pin feeds a clock from an external 3.3-V oscillator. In this case, the X1 pin, if available, must be tied to GND and the on-chip crystal oscillator must be disabled through bit 14 in the CLKCTL register. If a crystal/resonator is used, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. NOTE: Designs that use the GPIO38/TCK/XCLKIN pin to supply an external clock for normal device operation may need to incorporate some hooks to disable this path during debug using the JTAG connector. This is to prevent contention with the TCK signal, which is active during JTAG debug sessions. The zero-pin internal oscillators may be used during this time to clock the device.
X1	45	–	I	On-chip 1.8-V crystal-oscillator input. To use this oscillator, a quartz crystal or a ceramic resonator must be connected across X1 and X2. In this case, the XCLKIN path must be disabled by bit 13 in the CLKCTL register. If this pin is not used, it must be tied to GND. (I)
X2	46	–	O	On-chip crystal-oscillator output. A quartz crystal or a ceramic resonator must be connected across X1 and X2. If X2 is not used, it must be left unconnected. (O)
RESET				
XRS	3	17	I/OD	Device Reset (in) and Watchdog Reset (out). These devices have a built-in power-on reset (POR) and brown-out reset (BOR) circuitry. During a power-on or brown-out condition, this pin is driven low by the device. An external circuit may also drive this pin to assert a device reset. This pin is also driven low by the MCU when a watchdog reset occurs. During watchdog reset, the $\overline{\text{XRS}}$ pin is driven low for the watchdog reset duration of 512 OSCCLK cycles. A resistor with a value from 2.2 k Ω to 10 k Ω should be placed between $\overline{\text{XRS}}$ and V _{DDIO} . If a capacitor is placed between $\overline{\text{XRS}}$ and V _{SS} for noise filtering, it should be 100 nF or smaller. These values will allow the watchdog to properly drive the XRS pin to V _{OL} within 512 OSCCLK cycles when the watchdog reset is asserted. Regardless of the source, a device reset causes the device to terminate execution. The program counter points to the address contained at the location 0x3F FFC0. When reset is deactivated, execution begins at the location designated by the program counter. The output buffer of this pin is an open-drain device with an internal pullup. (†) If this pin is driven by an external device, it should be done using an open-drain device.

<i>GPIO32</i> SDAA EPWMSYNCI ADCSOAO	31	–	I/O/Z I/OD I O	General-purpose input/output 32 I2C data open-drain bidirectional port Enhanced PWM external sync pulse input ADC start-of-conversion A
<i>GPIO33</i> SCLA EPWMSYNCO ADCSOCBO	36	–	I/O/Z I/OD O O	General-Purpose Input/Output 33 I2C clock open-drain bidirectional port Enhanced PWM external synch pulse output ADC start-of-conversion B
<i>GPIO34</i> COMP2OUT – –	19	27	I/O/Z O	General-Purpose Input/Output 34 Direct output of Comparator 2. COMP2OUT signal is not available in the DA package. – –
GPIO35 TDI	20	28	I/O/Z I	General-Purpose Input/Output 35 JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK
GPIO36 TMS	21	29	I/O/Z I	General-Purpose Input/Output 36 JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK.
GPIO37 TDO	22	30	I/O/Z O/Z	General-Purpose Input/Output 37 JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK (8 mA drive)
GPIO38 TCK XCLKIN	23	31	I/O/Z I I	General-Purpose Input/Output 38 JTAG test clock with internal pullup External Oscillator Input. The path from this pin to the clock block is not gated by the mux function of this pin. Care must be taken to not enable this path for clocking if it is being used for the other functions.

- (1) I = Input, O = Output, Z = High Impedance, OD = Open Drain, ↑ = Pullup, ↓ = Pulldown
(2) The GPIO function (shown in bold italics) is the default at reset. The peripheral signals that are listed under them are alternate functions. For JTAG pins that have the GPIO functionality multiplexed, the input path to the GPIO block is always valid. The output path from the GPIO block and the path to the JTAG block from a pin is enabled/disabled based on the condition of the TRST signal. See the System Control chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) for details.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Supply voltage	V _{DDIO} (I/O and Flash) with respect to V _{SS}	-0.3	4.6	V
	V _{DD} with respect to V _{SS}	-0.3	2.5	
Analog voltage	V _{DDA} with respect to V _{SSA}	-0.3	4.6	V
Input voltage	V _{IN} (3.3 V)	-0.3	4.6	V
	V _{IN} (X1)	-0.3	2.5	
Output voltage	V _O	-0.3	4.6	V
Input clamp current	Digital/analog input (per pin), I _{IK} (V _{IN} < V _{SS} or V _{IN} > V _{DDIO}) ⁽³⁾	-20	20	mA
	Analog input (per pin), I _{IKANALOG} (V _{IN} < V _{SSA} or V _{IN} > V _{DDA})	-20	20	
	Total for all inputs, I _{IKTOTAL} (V _{IN} < V _{SS} /V _{SSA} or V _{IN} > V _{DDIO} /V _{DDA})	-20	20	
Output clamp current	I _{OK} (V _O < 0 or V _O > V _{DDIO})	-20	20	mA
Junction temperature ⁽⁴⁾	T _J	-40	150	°C
Storage temperature ⁽⁴⁾	T _{stg}	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 8.4](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to V_{SS}, unless otherwise noted.
- Continuous clamp current per pin is ±2 mA. Do not operate in this condition continuously as V_{DDIO}/V_{DDA} voltage may internally rise and impact other electrical specifications.
- Long-term high-temperature storage or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see [Semiconductor and IC Package Thermal Metrics](#); [Calculating Useful Lifetimes of Embedded Processors](#); and [Calculating FIT for a Mission Profile](#).

8.2 ESD Ratings – Automotive

			VALUE	UNIT
TMS320F28027-Q1, TMS320F28027F-Q1, TMS320F28026-Q1, TMS320F28026F-Q1, TMS320F28023-Q1, TMS320F28022-Q in 48-pin PT package				
V _(ESD) Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins	±2000	V
	Charged device model (CDM), per AEC Q100-011	All pins except corner pins	±500	
		Corner pins on 48-pin PT: 1, 12, 13, 24, 25, 36, 37, 48	±750	
TMS320F28027-Q1, TMS320F28027F-Q1, TMS320F28026-Q1, TMS320F28026F-Q1, TMS320F28023-Q1, TMS320F28022-Q1 in 38-pin DA package				
V _(ESD) Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins	±2000	V
	Charged device model (CDM), per AEC Q100-011	All pins except corner pins	±500	
		Corner pins on 38-pin DA: 1, 19, 20, 38	±750	

- AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

8.3 ESD Ratings – Commercial

		VALUE	UNIT
TMS320F28027-Q1, TMS320F28027F-Q1, TMS320F28026-Q1, TMS320F28026F-Q1, TMS320F28023-Q1, TMS320F28022-Q1, TMS320F28021, TMS320F28020, TMS320F280200 in 48-pin PT package			
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 or ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	
TMS320F28027-Q1, TMS320F28027F-Q1, TMS320F28026-Q1, TMS320F28026F-Q1, TMS320F28023-Q1, TMS320F28022-Q1, TMS320F28021, TMS320F28020, TMS320F280200 in 38-pin DA package			
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 or ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Device supply voltage, I/O, V _{DDIO} ⁽¹⁾		2.97	3.3	3.63	V
Device supply voltage CPU, V _{DD} (When internal VREG is disabled and 1.8 V is supplied externally)		1.71	1.8	1.995	V
Supply ground, V _{SS}			0		V
Analog supply voltage, V _{DDA}		2.97	3.3	3.63	V
Analog ground, V _{SSA}			0		V
Device clock frequency (system clock)	28020, 28021, 280200	2		40	MHz
	28022, 28023	2		50	
	28026, 28027	2		60	
High-level input voltage, V _{IH} (3.3 V)		2		V _{DDIO} + 0.3	V
Low-level input voltage, V _{IL} (3.3 V)		V _{SS} - 0.3		0.8	V
High-level output source current, V _{OH} = V _{OH(MIN)} , I _{OH}	All GPIO/AIO pins			-4	mA
	Group 2 ⁽²⁾			-8	mA
Low-level output sink current, V _{OL} = V _{OL(MAX)} , I _{OL}	All GPIO/AIO pins			4	mA
	Group 2 ⁽²⁾			8	mA
Junction temperature, T _J ⁽³⁾	T version	-40		105	°C
	S version	-40		125	
	Q version (AEC Q100 Qualification)	-40		125	

- (1) A tolerance of ±10% may be used for V_{DDIO} if the BOR is not used. See the [TMS320F2802x, TMS320F2802xx MCUs Silicon Errata](#) for more information. V_{DDIO} tolerance is ±5% if the BOR is enabled.
(2) Group 2 pins are as follows: GPIO16, GPIO17, GPIO18, GPIO19, GPIO28, GPIO29, GPIO36, GPIO37
(3) T_A (Ambient temperature) is product- and application-dependent and can go up to the specified T_J max of the device. See [Section 8.8, Thermal Design Considerations](#).

8.5 Power Consumption Summary

8.5.1 TMS320F2802x/F280200 Current Consumption at 40-MHz SYSCLKOUT

MODE ⁽¹⁾	TEST CONDITIONS	VREG ENABLED				VREG DISABLED					
		I _{DDIO} ⁽²⁾		I _{DDA} ⁽³⁾		I _{DD}		I _{DDIO} ⁽²⁾		I _{DDA} ⁽³⁾	
		TYP ⁽⁴⁾	MAX	TYP ⁽⁴⁾	MAX	TYP ⁽⁴⁾	MAX	TYP ⁽⁴⁾	MAX	TYP ⁽⁴⁾	MAX
Operational (Flash)	The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4 eCAP1 SCI-A SPI-A ADC I2C COMP1/2 CPU Timer0/1/2 All PWM pins are toggled at 40 kHz. All I/O pins are left unconnected. ⁽⁵⁾ Code is running out of flash with 1 wait-state. XCLKOUT is turned off.	70 mA	80 mA	13 mA	18 mA	62 mA	70 mA	15 mA	18 mA	13 mA	18 mA
IDLE	Flash is powered down. XCLKOUT is turned off. All peripheral clocks are off.	13 mA	16 mA	53 μA	58 μA	15 mA	17 mA	120 μA	400 μA	53 μA	58 μA
STANDBY	Flash is powered down. Peripheral clocks are off.	3 mA	6 mA	10 μA	15 μA	3 mA	6 mA	120 μA	400 μA	10 μA	15 μA
HALT	Flash is powered down. Peripheral clocks are off. Input clock is disabled. ⁽⁶⁾	50 μA		10 μA	15 μA	15 μA		25 μA		10 μA	15 μA

- For the TMS320F280200 device, subtract the I_{DD} current number for eCAP (see [Table 8-1](#)) from I_{DD} (VREG disabled)/I_{DDIO} (VREG enabled) current numbers shown in [Section 8.5.1](#) for operational mode.
- I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- To realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCRO register.
- The TYP numbers are applicable over room temperature and nominal voltage.
- The following is done in a loop:
 - Data is continuously transmitted out of SPI-A and SCI-A ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

8.5.2 TMS320F2802x Current Consumption at 50-MHz SYSCLOCKOUT

MODE	TEST CONDITIONS	VREG ENABLED				VREG DISABLED					
		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾		I _{DD}		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾	
		TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX
Operational (Flash)	The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4 eCAP1 SCI-A SPI-A ADC I2C COMP1/2 CPU Timer0/1/2 All PWM pins are toggled at 40 kHz. All I/O pins are left unconnected. ⁽⁴⁾ Code is running out of flash with 1 wait-state. XCLKOUT is turned off.	80 mA	90 mA	13 mA	18 mA	71 mA	80 mA	15 mA	18 mA	13 mA	18 mA
IDLE	Flash is powered down. XCLKOUT is turned off. All peripheral clocks are off.	16 mA	19 mA	64 μA	69 μA	17 mA	20 mA	120 μA	400 μA	64 μA	69 μA
STANDBY	Flash is powered down. Peripheral clocks are off.	4 mA	7 mA	10 μA	15 μA	4 mA	7 mA	120 μA	400 μA	10 μA	15 μA
HALT	Flash is powered down. Peripheral clocks are off. Input clock is disabled. ⁽⁵⁾	50 μA		10 μA	15 μA	15 μA		25 μA		10 μA	15 μA

- (1) I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- (2) To realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- (3) The TYP numbers are applicable over room temperature and nominal voltage.
- (4) The following is done in a loop:
 - Data is continuously transmitted out of SPI-A and SCI-A ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- (5) If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

8.5.3 TMS320F2802x Current Consumption at 60-MHz SYSCLOCKOUT

MODE	TEST CONDITIONS	VREG ENABLED				VREG DISABLED					
		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾		I _{DD}		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾	
		TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX
Operational (Flash)	The following peripheral clocks are enabled: <ul style="list-style-type: none"> ePWM1/2/3/4 eCAP1 SCI-A SPI-A ADC I2C COMP1/2 CPU-TIMER0/1/2 All PWM pins are toggled at 60 kHz. All I/O pins are left unconnected. ⁽⁴⁾ Code is running out of flash with 2 wait states. XCLKOUT is turned off.	90 mA	100 mA	13 mA	18 mA	80 mA	90 mA	15 mA	18 mA	13 mA	18 mA

MODE	TEST CONDITIONS	VREG ENABLED				VREG DISABLED					
		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾		I _{DD}		I _{DDIO} ⁽¹⁾		I _{DDA} ⁽²⁾	
		TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX	TYP ⁽³⁾	MAX
IDLE	Flash is powered down. XCLKOUT is turned off. All peripheral clocks are turned off.	18 mA	23 mA	75 μA	80 μA	19 mA	24 mA	120 μA	400 μA	75 μA	80 μA
STANDBY	Flash is powered down. Peripheral clocks are off.	4 mA	7 mA	10 μA	15 μA	4 mA	7 mA	120 μA	400 μA	10 μA	15 μA
HALT	Flash is powered down. Peripheral clocks are off. Input clock is disabled. ⁽⁵⁾	50 μA		10 μA	15 μA	15 μA		25 μA		10 μA	15 μA

- (1) I_{DDIO} current is dependent on the electrical loading on the I/O pins.
- (2) To realize the I_{DDA} currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.
- (3) The TYP numbers are applicable over room temperature and nominal voltage.
- (4) The following is done in a loop:
 - Data is continuously transmitted out of SPI-A and SCI-A ports.
 - The hardware multiplier is exercised.
 - Watchdog is reset.
 - ADC is performing continuous conversion.
 - COMP1/2 are continuously switching voltages.
 - GPIO17 is toggled.
- (5) If a quartz crystal or ceramic resonator is used as the clock source, the HALT mode shuts down the on-chip crystal oscillator.

Note

The peripheral - I/O multiplexing implemented in the device prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

8.5.4 Reducing Current Consumption

The 2802x/280200 devices incorporate a method to reduce the device current consumption. Because each peripheral unit has an individual clock-enable bit, significant reduction in current consumption can be achieved by turning off the clock to any peripheral module that is not used in a given application. Furthermore, any one of the three low-power modes could be taken advantage of to reduce the current consumption even further. [Table 8-1](#) indicates the typical reduction in current consumption achieved by turning off the clocks.

Table 8-1. Typical Current Consumption by Various Peripherals (at 60 MHz)

PERIPHERAL MODULE ^{(1) (3)}	I _{DD} CURRENT REDUCTION (mA)
ADC	2 ⁽²⁾
I2C	3
ePWM	2
eCAP	2
SCI	2
SPI	2
COMP/DAC	1
HRPWM	3
CPU-TIMER	1
Internal zero-pin oscillator	0.5

- (1) All peripheral clocks (except CPU Timer clocks) are disabled upon reset. Writing to/reading from peripheral registers is possible only after the peripheral clocks are turned on.
- (2) This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC (I_{DDA}) as well.
- (3) For peripherals with multiple instances, the current quoted is per module. For example, the 2 mA value quoted for ePWM is for one ePWM module.

Note

I_{DDIO} current consumption is reduced by 15 mA (typical) when XCLKOUT is turned off.

Note

The baseline I_{DD} current (current when the core is executing a dummy loop with no peripherals enabled) is 45 mA, typical. To arrive at the I_{DD} current for a given application, the current-drawn by the peripherals (enabled by that application) must be added to the baseline I_{DD} current.

Following are other methods to reduce power consumption further:

- The flash module may be powered down if code is run off SARAM. This results in a current reduction of 18 mA (typical) in the V_{DD} rail and 13 mA (typical) in the V_{DDIO} rail.
- Savings in I_{DDIO} may be realized by disabling the pullups on pins that assume an output function.
- To realize the lowest V_{DDA} current consumption in a low-power mode, see the respective analog chapter of the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) to ensure each module is powered down as well.

8.5.5 Current Consumption Graphs (VREG Enabled)

Figure 8-1. Typical Operational Current Versus Frequency (F2802x/F280200)

Figure 8-2. Typical Operational Power Versus Frequency (F2802x/F280200)

8.6 Electrical Characteristics

over recommended operating conditions (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT		
V _{OH}	High-level output voltage	I _{OH} = I _{OH} MAX		2.4			V		
		I _{OH} = 50 μA		V _{DDIO} - 0.2					
V _{OL}	Low-level output voltage	I _{OL} = I _{OL} MAX		0.4			V		
I _{IL}	Input current (low level)	Pin with pullup enabled	V _{DDIO} = 3.3 V, V _{IN} = 0 V	All GPIO		-80	-140	-205	μA
				XRS pin		-225	-290	-360	
		Pin with pulldown enabled	V _{DDIO} = 3.3 V, V _{IN} = 0 V				±2		

over recommended operating conditions (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{IH}	Input current (high level)	Pin with pullup enabled			±2	μA
		Pin with pulldown enabled	28	50	80	
I _{OZ}	Output current, pullup or pulldown disabled	V _O = V _{DDIO} or 0 V			±2	μA
C _I	Input capacitance			2		pF
	V _{DDIO} BOR trip point	Falling V _{DDIO}	2.42	2.65	3.135	V
	V _{DDIO} BOR hysteresis			35		mV
	Supervisor reset release delay time	Time after BOR/POR/OVR event is removed to XRS release	400		800	μs
	VREG V _{DD} output	Internal VREG on		1.9		V

- (1) When the on-chip VREG is used, its output is monitored by the POR/BOR circuit, which will reset the device should the core voltage (V_{DD}) go out of range.

8.7 Thermal Resistance Characteristics

8.7.1 PT Package

		°C/W ⁽¹⁾	AIR FLOW (lfm) ⁽²⁾
R _{θJC}	Junction-to-case thermal resistance	13.6	N/A
R _{θJB}	Junction-to-board thermal resistance	30.6	N/A
R _{θJA} (High k PCB)	Junction-to-free air thermal resistance	64	0
		50.4	150
		48.2	250
		45	500
Psi _{JT}	Junction-to-package top	0.56	0
		0.94	150
		1.1	250
Psi _{JB}	Junction-to-board	1.38	500
		30.1	0
		28.7	150
		28.4	250
		28	500

(1) These values are based on a JEDEC defined 2S2P system (with the exception of the Theta JC [R_{θJC}] value, which is based on a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/ JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

(2) lfm = linear feet per minute

8.7.2 DA Package

		°C/W ⁽¹⁾	AIR FLOW (lfm) ⁽²⁾
R _{θJC}	Junction-to-case thermal resistance	12.8	N/A
R _{θJB}	Junction-to-board thermal resistance	33	N/A

		56.4	150
		53.9	250
		50.2	500
Psi _{JT}	Junction-to-package top	0.34	0
		0.61	150
		0.74	250
Psi _{JB}	Junction-to-board	0.98	500
		32.5	0
		32.1	150
		31.7	250
		31.1	500

(1) These values are based on a JEDEC defined 2S2P system (with the exception of the Theta JC [R_{θJC}] value, which is based on a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/ JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

(2) lfm = linear feet per minute

8.8 Thermal Design Considerations

Based on the end application design and operational profile, the I_{DD} and I_{DDIO} currents could vary. Systems that exceed the recommended maximum power dissipation in the end product may require additional thermal enhancements. Ambient temperature (T_A) varies with the end application and product design. The critical factor that affects reliability and functionality is T_J , the junction temperature, not the ambient temperature. Hence, care should be taken to keep T_J within the specified limits. T_{case} should be measured to estimate the operating junction temperature T_J . T_{case} is normally measured at the center of the package top-side surface. The thermal application report [Semiconductor and IC Package Thermal Metrics](#) helps to understand the thermal metrics and definitions.

8.9 JTAG Debug Probe Connection Without Signal Buffering for the MCU

Figure 8-3 shows the connection between the MCU and JTAG header for a single-processor configuration. If the distance between the JTAG header and the MCU is greater than 6 inches, the emulation signals must be buffered. If the distance is less than 6 inches, buffering is typically not needed. Figure 8-3 shows the simpler, no-buffering situation. For the pullup/pulldown resistor values, see [Section 7.2, Signal Descriptions](#).

A. See [Figure 9-39](#) for JTAG/GPIO multiplexing.

Figure 8-3. JTAG Debug Probe Connection Without Signal Buffering for the MCU

Note

The 2802x devices do not have EMU0/EMU1 pins. For designs that have a JTAG Header onboard, the EMU0/EMU1 pins on the header must be tied to V_{DDIO} through a 4.7-k Ω (typical) resistor.

8.10 Parameter Information

8.10.1 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:		Letters and symbols and their meanings:	
a	access time	H	High
c	cycle time (period)	L	Low
d	delay time	V	Valid
f	fall time	X	Unknown, changing, or don't care level
h	hold time	Z	High impedance
r	rise time		
su	setup time		
t	transition time		
v	valid time		
w	pulse duration (width)		

8.10.2 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

8.11 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

- Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.
- The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Figure 8-4. 3.3-V Test Load Circuit

8.12 Power Sequencing

There is no power sequencing requirement needed to ensure the device is in the proper state after reset or to prevent the I/Os from glitching during power up/down (GPIO19, GPIO34–38 do not have glitch-free I/Os). No voltage larger than a diode drop (0.7 V) above V_{DDIO} should be applied to any digital pin (for analog pins, this value is 0.7 V above V_{DDA}) before powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

- Upon power up, SYSCLKOUT is OSCCLK/4. Because the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, SYSCLKOUT is further divided by 4 before it appears at XCLKOUT. XCLKOUT = OSCCLK/16 during this phase.
- Boot ROM configures the DIVSEL bits for /1 operation. XCLKOUT = OSCCLK/4 during this phase. XCLKOUT will not be visible at the pin until explicitly configured by user code.
- After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.
- Using the \overline{XRS} pin is optional due to the on-chip power-on reset (POR) circuitry.
- The internal pullup/pulldown will take effect when BOR is driven high.

Figure 8-5. Power-on Reset

8.12.1 Reset ($\overline{\text{XRS}}$) Timing Requirements

		MIN	MAX	UNIT
$t_{h(\text{boot-mode})}$	Hold time for boot-mode pins	$1000t_{c(\text{SCO})}$		cycles
$t_{w(\text{RSL2})}$	Pulse duration, $\overline{\text{XRS}}$ low on warm reset	$32t_{c(\text{OSCCLK})}$		cycles

8.12.2 Reset ($\overline{\text{XRS}}$) Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{w(\text{RSL1})}$	Pulse duration, $\overline{\text{XRS}}$ driven by device		600		μs
$t_{w(\text{WDRS})}$	Pulse duration, reset pulse generated by watchdog		$512t_{c(\text{OSCCLK})}$		cycles
$t_{d(\text{EX})}$	Delay time, address/data valid after $\overline{\text{XRS}}$ high		$32t_{c(\text{OSCCLK})}$		cycles
t_{INTOSCST}	Start-up time, internal zero-pin oscillator		3		μs
$t_{\text{OSCST}}^{(1)}$	On-chip crystal-oscillator start-up time	1	10		ms

(1) Dependent on crystal/resonator and board design.

A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 8-6. Warm Reset

Figure 8-7 shows an example for the effect of writing into PLLCR register. In the first phase, PLLCR = 0x0004 and SYSCLKOUT = OSCCLK x 2. The PLLCR is then written with 0x0008. Right after the PLLCR register is written, the PLL lock-up phase begins. During this phase, SYSCLKOUT = OSCCLK/2. After the PLL lock-up is complete, SYSCLKOUT reflects the new operating frequency, OSCCLK x 4.

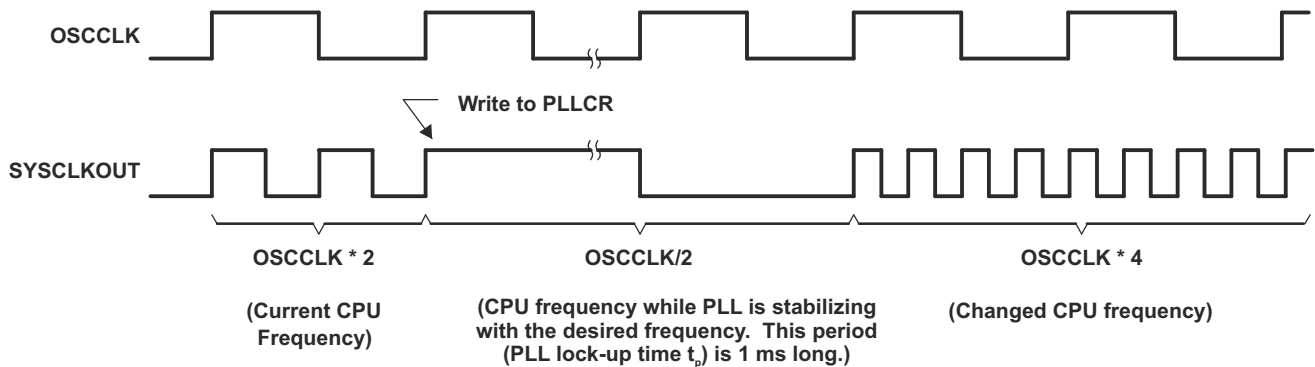

Figure 8-7. Example of Effect of Writing Into PLLCR Register

8.13 Clock Specifications

8.13.1 Device Clock Table

This section provides the timing requirements and switching characteristics for the various clock options available on the 2802x MCUs. [Section 8.13.1.1](#), [Section 8.13.1.2](#), and [Section 8.13.1.3](#) list the cycle times of various clocks.

8.13.1.1 2802x Clock Table and Nomenclature (40-MHz Devices)

		MIN	NOM	MAX	UNIT
SYSCLKOUT	$t_{c(SCO)}$, Cycle time	25		500	ns
	Frequency	2		40	MHz
LSPCLK ⁽¹⁾	$t_{c(LCO)}$, Cycle time	25	100 ⁽²⁾		ns
	Frequency		10 ⁽²⁾	40	MHz
ADC clock	$t_{c(ADCCLK)}$, Cycle time	25			ns
	Frequency			40	MHz

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 40 MHz.

8.13.1.2 2802x Clock Table and Nomenclature (50-MHz Devices)

		MIN	NOM	MAX	UNIT
SYSCLKOUT	$t_{c(SCO)}$, Cycle time	20		500	ns
	Frequency	2		50	MHz
LSPCLK ⁽¹⁾	$t_{c(LCO)}$, Cycle time	20	80 ⁽²⁾		ns
	Frequency		12.5 ⁽²⁾	50	MHz
ADC clock	$t_{c(ADCCLK)}$, Cycle time	20			ns
	Frequency			50	MHz

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 50 MHz.

8.13.1.3 2802x Clock Table and Nomenclature (60-MHz Devices)

		MIN	NOM	MAX	UNIT
SYSCLKOUT	$t_{c(SCO)}$, Cycle time	16.67		500	ns
	Frequency	2		60	MHz
LSPCLK ⁽¹⁾	$t_{c(LCO)}$, Cycle time	16.67	66.67 ⁽²⁾		ns
	Frequency		15 ⁽²⁾	60	MHz
ADC clock	$t_{c(ADCCLK)}$, Cycle time	16.67			ns
	Frequency			60	MHz

- (1) Lower LSPCLK will reduce device power consumption.
(2) This is the default reset value if SYSCLKOUT = 60 MHz.

8.13.1.4 Device Clocking Requirements/Characteristics

		MIN	NOM	MAX	UNIT
On-chip oscillator (X1/X2 pins) (Crystal/Resonator)	$t_{c(OSC)}$, Cycle time	50		200	ns
	Frequency	5		20	MHz
External oscillator/clock source (XCLKIN pin) — PLL Enabled	$t_{c(CI)}$, Cycle time (C8)	33.3		200	ns
	Frequency	5		30	MHz
External oscillator/clock source (XCLKIN pin) — PLL Disabled	$t_{c(CI)}$, Cycle time (C8)	33.33		250	ns
	Frequency	4		30	MHz
Limp mode SYSCLKOUT (with /2 enabled)	Frequency range	1 to 5			MHz
XCLKOUT	$t_{c(XCO)}$, Cycle time (C1)	66.67		2000	ns
	Frequency	0.5		15	MHz
PLL lock time ⁽¹⁾	t_p			1	ms

- (1) The PLLLOCKPRD register must be updated based on the number of OSCCLK cycles. If the zero-pin internal oscillators (10 MHz) are used as the clock source, then the PLLLOCKPRD register must be written with a value of 10,000 (minimum).

8.13.1.5 Internal Zero-Pin Oscillator (INTOSC1/INTOSC2) Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
Internal zero-pin oscillator 1 (INTOSC1) ^{(1) (2)}	Frequency		10		MHz
Internal zero-pin oscillator 2 (INTOSC2) ^{(1) (2)}	Frequency		10		MHz
Step size (coarse trim)			55		kHz
Step size (fine trim)			14		kHz
Temperature drift ⁽³⁾			3.03	4.85	kHz/°C
Voltage (V _{DD}) drift ⁽³⁾			175		Hz/mV

- (1) Oscillator frequency will vary over temperature, see [Figure 8-8](#). To compensate for oscillator temperature drift, see the [Oscillator Compensation Guide](#) and C2000Ware.
- (2) Frequency range ensured only when VREG is enabled, $\overline{\text{VREGENZ}} = V_{\text{SS}}$.
- (3) Output frequency of the internal oscillators follows the direction of both the temperature gradient and voltage (V_{DD}) gradient. For example:
 - Increase in temperature will cause the output frequency to increase per the temperature coefficient.
 - Decrease in voltage (V_{DD}) will cause the output frequency to decrease per the voltage coefficient.

Figure 8-8. Zero-Pin Oscillator Frequency Movement With Temperature

8.13.2 Clock Requirements and Characteristics

8.13.2.1 XCLKIN Timing Requirements – PLL Enabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN		6	ns
C10	$t_{r(CI)}$	Rise time, XCLKIN		6	ns
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45%	55%	
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45%	55%	

8.13.2.2 XCLKIN Timing Requirements – PLL Disabled

NO.			MIN	MAX	UNIT
C9	$t_{f(CI)}$	Fall time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 30 MHz	2	
C10	$t_{r(CI)}$	Rise time, XCLKIN	Up to 20 MHz	6	ns
			20 MHz to 30 MHz	2	
C11	$t_{w(CIL)}$	Pulse duration, XCLKIN low as a percentage of $t_{c(OSCCLK)}$	45%	55%	
C12	$t_{w(CIH)}$	Pulse duration, XCLKIN high as a percentage of $t_{c(OSCCLK)}$	45%	55%	

The possible configuration modes are shown in [Table 9-16](#).

8.13.2.3 XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)

over recommended operating conditions (unless otherwise noted)^{(1) (2)}

NO.	PARAMETER	MIN	MAX	UNIT
C3	$t_{f(XCO)}$		11	ns
C4	$t_{r(XCO)}$		11	ns
C5	$t_{w(XCOL)}$	H – 2	H + 2	ns
C6	$t_{w(XCOH)}$	H – 2	H + 2	ns

(1) A load of 40 pF is assumed for these parameters.

(2) $H = 0.5t_{c(XCO)}$

- A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown is intended to illustrate the timing parameters only and may differ based on actual configuration.
- B. XCLKOUT configured to reflect SYSCLKOUT.

Figure 8-9. Clock Timing

8.14 Flash Timing

8.14.1 Flash/OTP Endurance for T Temperature Material

		ERASE/PROGRAM TEMPERATURE ⁽¹⁾	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	0°C to 105°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

8.14.2 Flash/OTP Endurance for S Temperature Material

		ERASE/PROGRAM TEMPERATURE ⁽¹⁾	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	0°C to 125°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	0°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

8.14.3 Flash/OTP Endurance for Q Temperature Material

		ERASE/PROGRAM TEMPERATURE ⁽¹⁾	MIN	TYP	MAX	UNIT
N _f	Flash endurance for the array (write/erase cycles)	-40°C to 125°C (ambient)	20000	50000		cycles
N _{OTP}	OTP endurance for the array (write cycles)	-40°C to 30°C (ambient)			1	write

(1) Write/erase operations outside of the temperature ranges indicated are not specified and may affect the endurance numbers.

8.14.4 Flash Parameters at 60-MHz SYSCLKOUT

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{DDP} ⁽¹⁾	V _{DD} current consumption during Erase/Program cycle	VREG disabled		80		mA
I _{DDIOP} ⁽¹⁾	V _{DDIO} current consumption during Erase/Program cycle			60		mA
I _{DDIOP} ⁽¹⁾	V _{DDIO} current consumption during Erase/Program cycle	VREG enabled		120		mA

(1) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.

8.14.5 Flash Parameters at 50-MHz SYSCLKOUT

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{DDP} ⁽¹⁾	V _{DD} current consumption during Erase/Program cycle	VREG disabled		70		mA
I _{DDIOP} ⁽¹⁾	V _{DDIO} current consumption during Erase/Program cycle			60		
I _{DDIOP} ⁽¹⁾	V _{DDIO} current consumption during Erase/Program cycle	VREG enabled		110		mA

(1) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.

8.14.6 Flash Parameters at 40-MHz SYSCLKOUT

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{DDP}^{(1)}$	V_{DD} current consumption during Erase/Program cycle	VREG disabled		60		mA
$I_{DDIOP}^{(1)}$	V_{DDIO} current consumption during Erase/Program cycle			60		
$I_{DDIOP}^{(1)}$	V_{DDIO} current consumption during Erase/Program cycle	VREG enabled		100		mA

- (1) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.

8.14.7 Flash Program/Erase Time

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX ⁽²⁾	UNIT
Program Time ⁽¹⁾	8K Sector			250	2000	ms
	4K Sector			125	2000	ms
	16-Bit Word			50		µs
Erase Time ⁽³⁾	8K Sector			2	12	s
	4K Sector			2	12	s

- (1) Program time is at the maximum device frequency. The programming time indicated in this table is applicable only when all the required code/data is available in the device RAM, ready for programming. Program time includes overhead of the flash state machine but does not include the time to transfer the following into RAM:
- the code that uses flash API to program the flash
 - the Flash API itself
 - Flash data to be programmed
- (2) Maximum flash parameter mentioned are for the first 100 program and erase cycles.
- (3) The on-chip flash memory is in an erased state when the device is shipped from TI. As such, erasing the flash memory is not required prior to programming, when programming the device for the first time. However, the erase operation is needed on all subsequent programming operations.

8.14.8 Flash/OTP Access Timing

PARAMETER		MIN	MAX	UNIT
$t_{a(fp)}$	Paged Flash access time	40		ns
$t_{a(fr)}$	Random Flash access time	40		ns
$t_{a(OTP)}$	OTP access time	60		ns

8.14.9 Flash Data Retention Duration

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{retention}$	Data retention duration	$T_J = 55^\circ\text{C}$	15		years

Table 8-2. Minimum Required Flash/OTP Wait States at Different Frequencies

SYCLKOUT (MHz)	SYCLKOUT (ns)	PAGE WAIT STATE ⁽¹⁾	RANDOM WAIT STATE ⁽¹⁾	OTP WAIT STATE
60	16.67	2	2	3
55	18.18	2	2	3
50	20	1	1	2
45	22.22	1	1	2
40	25	1	1	2
35	28.57	1	1	2
30	33.33	1	1	1
25	40	0	1	1

(1) Random wait state must be ≥ 1 .

The equations to compute the Flash page wait state and random wait state in [Table 8-2](#) are as follows:

$$\text{Flash Page Wait State} = \left\lceil \left(\frac{t_{a(f \cdot p)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer}$$

$$\text{Flash Random Wait State} = \left\lceil \left(\frac{t_{a(f \cdot r)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

The equation to compute the OTP wait state in [Table 8-2](#) is as follows:

$$\text{OTP Wait State} = \left\lceil \left(\frac{t_{a(OTP)}}{t_{c(SCO)}} \right) - 1 \right\rceil \text{ round up to the next highest integer, or 1, whichever is larger}$$

9 Detailed Description

9.1 Overview

9.1.1 CPU

The 2802x (C28x) family is a member of the TMS320C2000™ microcontroller (MCU) platform. The C28x-based controllers have the same 32-bit fixed-point architecture as existing C28x MCUs. It is a very efficient C/C++ engine, enabling users to develop not only their system control software in a high-level language, but also enabling development of math algorithms using C/C++. The device is as efficient at MCU math tasks as it is at system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 × 32-bit MAC 64-bit processing capabilities enable the controller to handle higher numerical resolution problems efficiently. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The device has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables it to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

9.1.2 Memory Bus (Harvard Bus Architecture)

As with many MCU-type devices, multiple buses are used to move data between the memories and peripherals and the CPU. The memory bus architecture contains a program read bus, data read bus, and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write buses consist of 32 address lines and 32 data lines each. The 32-bit-wide data buses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed Harvard Bus, enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus prioritize memory accesses. Generally, the priority of memory bus accesses can be summarized as follows:

— Highest:	Data Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
—	Program Writes	(Simultaneous data and program writes cannot occur on the memory bus.)
—	Data Reads	
—	Program Reads	(Simultaneous program reads and fetches cannot occur on the memory bus.)
— Lowest:	Fetches	(Simultaneous program reads and fetches cannot occur on the memory bus.)

9.1.3 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) MCU family of devices, the devices adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various buses that make up the processor Memory Bus into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Three versions of the peripheral bus are supported. One version supports only 16-bit accesses (called peripheral frame 2). Another version supports both 16- and 32-bit accesses (called peripheral frame 1).

9.1.4 Real-Time JTAG and Analysis

The devices implement the standard IEEE 1149.1 JTAG ¹interface for in-circuit based debug. Additionally, the devices support real-time mode of operation allowing modification of the contents of memory, peripheral, and register locations while the processor is running and executing code and servicing interrupts. The user can also single step through non-time-critical code while enabling time-critical interrupts to be serviced without interference. The device implements the real-time mode in hardware within the CPU. This is a feature unique to the 28x family of devices, requiring no software monitor. Additionally, special analysis hardware is provided that allows setting of hardware breakpoint or data/address watch-points and generating various user-selectable break events when a match occurs. These devices do not support boundary scan; however, IDCODE and BYPASS features are available if the following considerations are taken into account. The IDCODE does not come by default. The user must go through a sequence of SHIFT IR and SHIFT DR state of JTAG to get the IDCODE. For BYPASS instruction, the first shifted DR value would be 1.

9.1.5 Flash

The F280200 device contains 8K × 16 of embedded flash memory, segregated into two 4K × 16 sectors. The F28021/23/27 devices contain 32K × 16 of embedded flash memory, segregated into four 8K × 16 sectors. The F28020/22/26 devices contain 16K × 16 of embedded flash memory, segregated into four 4K × 16 sectors. All devices also contain a single 1K × 16 of OTP memory at address range 0x3D 7800 to 0x3D 7BFF. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase/program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information. Addresses 0x3F 7FF0 to 0x3F 7FF5 are reserved for data variables and should not contain program code.

Note

The Flash and OTP wait states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait-state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent.

For more information on the Flash options, Flash wait state, and OTP wait-state registers, see the System Control chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

9.1.6 M0, M1 SARAMs

All devices contain these two blocks of single access memory, each 1K × 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

9.1.7 L0 SARAM

The device contains up to 4K × 16 of single-access RAM. Refer to the device-specific memory map figures in [Section 9.2](#) to ascertain the exact size for a given device. This block is mapped to both program and data space.

¹ IEEE Standard 1149.1-1990 Standard Test Access Port and Boundary Scan Architecture

9.1.8 Boot ROM

The Boot ROM is factory-programmed with bootloader software. The Boot ROM uses the boot-mode-select GPIO pins to determine what boot mode to use upon power up. The user can select to boot normally to application code, to download new software from an external connection, or to select boot software that is programmed in the internal Flash/ROM. The Boot ROM also contains standard tables, such as SIN/COS waveforms, for use in math-related algorithms. The boot-ROM content, and hence the checksum value, may vary for different silicon revisions. For details, see the Boot ROM chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

Table 9-1. Boot Mode Selection

MODE	GPIO37/TDO	GPIO34/COMP2OUT	TRST	MODE
3	1	1	0	GetMode
2	1	0	0	Wait (see Section 9.1.9 for description)
1	0	1	0	SCI
0	0	0	0	Parallel IO
EMU	x	x	1	Emulation Boot

9.1.8.1 Emulation Boot

When the JTAG debug probe is connected, the GPIO37/TDO pin cannot be used for boot mode selection. In this case, the boot ROM detects that a JTAG debug probe is connected and uses the contents of two reserved SARAM locations in the PIE vector table to determine the boot mode. If the content of either location is invalid, then the *Wait* boot option is used. All boot mode options can be accessed in emulation boot.

9.1.8.2 GetMode

The default behavior of the *GetMode* option is to boot to flash. This behavior can be changed to another boot option by programming two locations in the OTP. If the content of either OTP location is invalid, then boot to flash is used. One of the following loaders can be specified: SCI, SPI, I2C, or OTP.

9.1.8.3 Peripheral Pins Used by the Bootloader

[Table 9-2](#) shows which GPIO pins are used by each peripheral bootloader. Refer to the GPIO mux table to see if these conflict with any of the peripherals you would like to use in your application.

Table 9-2. Peripheral Bootload Pins

BOOTLOADER	PERIPHERAL LOADER PINS
SCI	SCIRXDA (GPIO28) SCITXDA (GPIO29)
Parallel Boot	Data (GPIO[7:0]) 28x Control (GPIO16) Host Control (GPIO12)
SPI	SPISIMOA (GPIO16) SPISOMIA (GPIO17) SPICLKA (GPIO18) SPISTEA (GPIO19)
I2C	SDAA (GPIO32) ⁽¹⁾ SCLA (GPIO33) ⁽¹⁾

(1) GPIO pins 32 and 33 may not be available on your device package. On these devices, this bootload option is unavailable.

9.1.9 Security

The devices support high levels of security to protect the user firmware from being reverse engineered. The security features a 128-bit password (hardcoded for 16 wait states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents through the JTAG port or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit KEY value that matches the value stored in the password locations within the Flash.

In addition to the CSM, the emulation code security logic (ECSL) has been implemented to prevent unauthorized users from stepping through secure code. Any code or data access to flash, user OTP, or L0 memory while the JTAG debug probe is connected will trip the ECSL and break the debug probe connection. To allow debug of secure code, while maintaining the CSM protection against secure memory reads, the user must write the correct value into the lower 64 bits of the KEY register (KEY0 - KEY3), which matches the value stored in the lower 64 bits of the password locations (PWL0 - PWL3) within the flash. Dummy reads of all 128 bits of the password in the flash must still be performed. If the lower 64 bits of the password locations are all ones (unprogrammed), then the KEY value does not need to match. During debug of secure code, operations like single-stepping is possible. However, the actual contents of the secure memory cannot be seen in the CCS window.

When power is applied to a secure device that is connected to a JTAG debug probe, the CPU will start executing and may execute an instruction that performs an access to a protected area. If this happens, the ECSL will trip and cause the JTAG circuitry to be deactivated. Under this condition, a host (such as a computer running CCS or flash programming software) would not be able to establish connection with the device.

The solution is to use the *Wait* boot option. In this mode, the device loops around a software breakpoint to allow a JTAG debug probe to be connected without tripping security. The user can then exit this mode once the JTAG debug probe is connected by using one of the emulation boot options as described in the Boot ROM chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#). These devices do not support a hardware wait-in-reset mode.

Note

- When the code-security passwords are programmed, all addresses from 0x3F7F80 to 0x3F7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If reprogramming of a secure device via JTAG may be needed in future, it is important to design the board in such a way that the device could be put in Wait boot mode upon power-up (when reprogramming is warranted). Otherwise, ECSL may deactivate the JTAG circuitry and prevent connection to the device, as mentioned earlier. If reconfiguring the device for Wait boot mode in the field is not practical, some mechanism must be implemented in the firmware to detect when a firmware update is warranted. Code could then branch to the desired bootloader in the bootROM. It could also branch to the Wait bootmode, at which point the JTAG debug probe could be connected, device unsecured and programming accomplished through JTAG itself.
- If the code security feature is not used, addresses 0x3F7F80 to 0x3F7FEF may be used for code or data. Addresses 0x3F7FF0 to 0x3F7FF5 are reserved for data and should not contain program code.

The 128-bit password (at 0x3F 7FF8 to 0x3F 7FFF) must not be programmed to zeros. Doing so would permanently lock the device.

Note

Code Security Module Disclaimer

THE CODE SECURITY MODULE (CSM) INCLUDED ON THIS DEVICE WAS DESIGNED TO PASSWORD PROTECT THE DATA STORED IN THE ASSOCIATED MEMORY (EITHER ROM OR FLASH) AND IS WARRANTED BY TEXAS INSTRUMENTS (TI), IN ACCORDANCE WITH ITS STANDARD TERMS AND CONDITIONS, TO CONFORM TO TI'S PUBLISHED SPECIFICATIONS FOR THE WARRANTY PERIOD APPLICABLE FOR THIS DEVICE.

TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

9.1.10 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F2802x, 33 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. It takes 8 CPU clock cycles to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled/disabled within the PIE block.

9.1.11 External Interrupts (XINT1–XINT3)

The devices support three masked external interrupts (XINT1–XINT3). Each of the interrupts can be selected for negative, positive, or both negative and positive edge triggering and can also be enabled/disabled. These interrupts also contain a 16-bit free running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time stamp the interrupt. There are no dedicated pins for the external interrupts. XINT1, XINT2, and XINT3 interrupts can accept inputs from GPIO0–GPIO31 pins.

9.1.12 Internal Zero Pin Oscillators, Oscillator, and PLL

The device can be clocked by either of the two internal zero-pin oscillators, an external oscillator, or by a crystal attached to the on-chip oscillator circuit (48-pin devices only). A PLL is provided supporting up to 12 input-clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to [Section 8](#), Electrical Specifications, for timing details. The PLL block can be set in bypass mode.

9.1.13 Watchdog

Each device contains two watchdogs: CPU watchdog that monitors the core and NMI watchdog that is a missing clock-detect circuit. The user software must regularly reset the CPU watchdog counter within a certain time frame; otherwise, the CPU watchdog generates a reset to the processor. The CPU watchdog can be disabled if necessary. The NMI watchdog engages only in case of a clock failure and can either generate an interrupt or a device reset.

9.1.14 Peripheral Clocking

The clocks to each individual peripheral can be enabled/disabled to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except I2C) can be scaled relative to the CPU clock.

9.1.15 Low-power Modes

The devices are full static CMOS devices. Three low-power modes are provided:

- IDLE:** Place CPU in low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that must function during IDLE are left operating. An enabled interrupt from an active peripheral or the watchdog timer will wake the processor from IDLE mode.
- STANDBY:** Turns off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event
- HALT:** This mode basically shuts down the device and places it in the lowest possible power consumption mode. If the internal zero-pin oscillators are used as the clock source, the HALT mode turns them off, by default. To keep these oscillators from shutting down, the INTOSCnHALTI bits in CLKCTL register may be used. The zero-pin oscillators may thus be used to clock the CPU watchdog in this mode. If the on-chip crystal oscillator is used as the clock source, it is shut down in this mode. A reset or an external signal (through a GPIO pin) or the CPU watchdog can wake the device from this mode.

The CPU clock (OSCCLK) and watchdog clock source should be from the same clock source before attempting to put the device into HALT or STANDBY.

9.1.16 Peripheral Frames 0, 1, 2 (PFn)

The device segregates peripherals into three sections. The mapping of peripherals is as follows:

PF0:	PIE:	PIE Interrupt Enable and Control Registers Plus PIE Vector Table
	Flash:	Flash Waitstate Registers
	Timers:	CPU-Timers 0, 1, 2 Registers
	CSM:	Code Security Module KEY Registers
	ADC:	ADC Result Registers
PF1:	GPIO:	GPIO MUX Configuration and Control Registers
	ePWM:	Enhanced Pulse Width Modulator Module and Registers
	eCAP:	Enhanced Capture Module and Registers
	Comparators:	Comparator Modules
PF2:	SYS:	System Control Registers
	SCI:	Serial Communications Interface (SCI) Control and RX/TX Registers
	SPI:	Serial Port Interface (SPI) Control and RX/TX Registers
	ADC:	ADC Status, Control, and Configuration Registers
	I2C:	Inter-Integrated Circuit Module and Registers
	XINT:	External Interrupt Registers

9.1.17 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose input/output (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, GPIO pins are configured as inputs. The user can individually program each pin for GPIO mode or peripheral signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches. The GPIO signals can also be used to bring the device out of specific low-power modes.

9.1.18 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presetable periods and with 16-bit clock prescaling. The timers have a 32-bit count-down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value.

CPU-Timer 0 is for general use and is connected to the PIE block. CPU-Timer 1 is also for general use and can be connected to INT13 of the CPU. CPU-Timer 2 is reserved for DSP/BIOS. It is connected to INT14 of the CPU. If DSP/BIOS is not being used, CPU-Timer 2 is available for general use.

CPU-Timer 2 can be clocked by any one of the following:

- SYSCLKOUT (default)
- Internal zero-pin oscillator 1 (INTOSC1)
- Internal zero-pin oscillator 2 (INTOSC2)
- External clock source

9.1.19 Control Peripherals

The devices support the following peripherals that are used for embedded control and communication:

- ePWM: The enhanced PWM peripheral supports independent/complementary PWM generation, adjustable dead-band generation for leading/trailing edges, latched/cycle-by-cycle trip mechanism. Some of the PWM pins support the HRPWM high resolution duty and period features. The type 1 module found on 2802x devices also supports increased dead-band resolution, enhanced SOC and interrupt generation, and advanced triggering including trip functions based on comparator outputs.
- eCAP: The enhanced capture peripheral uses a 32-bit time base and registers up to four programmable events in continuous/one-shot capture modes. This peripheral can also be configured to generate an auxiliary PWM signal.
- ADC: The ADC block is a 12-bit converter. It has up to 13 single-ended channels pinned out, depending on the device. It contains two sample-and-hold units for simultaneous sampling.
- Comparator: Each comparator block consists of one analog comparator along with an internal 10-bit reference for supplying one input of the comparator.

9.1.20 Serial Port Peripherals

The devices support the following serial communication peripherals:

- SPI: The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (1 to 16 bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI. The SPI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- SCI: The serial communications interface is a two-wire asynchronous serial port, commonly known as UART. The SCI contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.
- I2C: The inter-integrated circuit (I2C) module provides an interface between an MCU and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus®) specification version 2.1 and connected by way of an I²C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the MCU through the I2C module. The I2C contains a 4-level receive and transmit FIFO for reducing interrupt servicing overhead.

9.2 Memory Maps

In Figure 9-1, Figure 9-2, Figure 9-3, Figure 9-4, and Figure 9-5, the following apply:

- Memory blocks are not to scale.
- Peripheral Frame 0, Peripheral Frame 1 and Peripheral Frame 2 memory maps are restricted to data memory only. A user program cannot access these memory maps in program space.
- *Protected* means the order of Write-followed-by-Read operations is preserved rather than the pipeline order.
- Certain memory ranges are EALLOW protected against spurious writes after configuration.
- Locations 0x3D7C80 to 0x3D7CC0 contain the internal oscillator and ADC calibration routines. These locations are not programmable by the user.

Table 9-3. Addresses of Flash Sectors in F28021/28023-Q1/28027-Q1

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3F 0000 to 0x3F 1FFF	Sector D (8K × 16)
0x3F 2000 to 0x3F 3FFF	Sector C (8K × 16)
0x3F 4000 to 0x3F 5FFF	Sector B (8K × 16)
0x3F 6000 to 0x3F 777F	Sector A (8K × 16)
0x3F 7F80 to 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 to 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 to 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

Table 9-4. Addresses of Flash Sectors in F28020/28022-Q1/28026-Q1

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3F 4000 to 0x3F 4FFF	Sector D (4K × 16)
0x3F 5000 to 0x3F 5FFF	Sector C (4K × 16)
0x3F 6000 to 0x3F 6FFF	Sector B (4K × 16)
0x3F 7000 to 0x3F 777F	Sector A (4K × 16)
0x3F 7F80 to 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 to 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 to 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

Table 9-5. Addresses of Flash Sectors in F280200

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3F 6000 to 0x3F 6FFF	Sector B (4K × 16)
0x3F 7000 to 0x3F 777F	Sector A (4K × 16)
0x3F 7F80 to 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 to 0x3F 7FF7	Boot-to-Flash Entry Point (program branch instruction here)
0x3F 7FF8 to 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

Note

- When the code-security passwords are programmed, all addresses from 0x3F 7F80 to 0x3F 7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If the code security feature is not used, addresses 0x3F 7F80 to 0x3F 7FEF may be used for code or data. Addresses 0x3F 7FF0 to 0x3F 7FF5 are reserved for data and should not contain program code.

Table 9-6 shows how to handle these memory locations.

Table 9-6. Impact of Using the Code Security Module

ADDRESS	FLASH	
	CODE SECURITY ENABLED	CODE SECURITY DISABLED
0x3F 7F80 to 0x3F 7FEF	Fill with 0x0000	Application code and data
0x3F 7FF0 to 0x3F 7FF5		Reserved for data only

Peripheral Frame 1 and Peripheral Frame 2 are grouped together to enable these blocks to be write/read peripheral block protected. The protected mode makes sure that all accesses to these blocks happen as written. Because of the pipeline, a write immediately followed by a read to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The CPU supports a block protection mode where a region of memory can be protected so that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it protects the selected zones.

The wait states for the various spaces in the memory map area are listed in [Table 9-7](#) .

Table 9-7. Wait States

AREA	WAIT STATES (CPU)	COMMENTS
M0 and M1 SARAMs	0-wait	Fixed
Peripheral Frame 0	0-wait	
Peripheral Frame 1	0-wait (writes) 2-wait (reads)	Cycles can be extended by peripheral generated ready. Back-to-back write operations to Peripheral Frame 1 registers will incur a 1-cycle stall (1-cycle delay).
Peripheral Frame 2	0-wait (writes) 2-wait (reads)	Fixed. Cycles cannot be extended by the peripheral.
L0 SARAM	0-wait data and program	Assumes no CPU conflicts
OTP	Programmable 1-wait minimum	Programmed through the Flash registers. 1-wait is minimum number of wait states allowed.
FLASH	Programmable 0-wait Paged min 1-wait Random min Random ≥ Paged	Programmed through the Flash registers.
FLASH Password	16-wait fixed	Wait states of password locations are fixed.
Boot-ROM	0-wait	

9.3 Register Maps

The devices contain three peripheral register spaces. The spaces are categorized as follows:

- Peripheral Frame 0: These are peripherals that are mapped directly to the CPU memory bus. See [Table 9-8](#).
- Peripheral Frame 1: These are peripherals that are mapped to the 32-bit peripheral bus. See [Table 9-9](#).
- Peripheral Frame 2: These are peripherals that are mapped to the 16-bit peripheral bus. See [Table 9-10](#).

Table 9-8. Peripheral Frame 0 Registers

NAME ⁽¹⁾	ADDRESS RANGE	SIZE (×16)	EALLOW PROTECTED ⁽²⁾
Device Emulation Registers	0x00 0880 to 0x00 0984	261	Yes
System Power Control Registers	0x00 0985 to 0x00 0987	3	Yes
FLASH Registers ⁽³⁾	0x00 0A80 to 0x00 0ADF	96	Yes
Code Security Module Registers	0x00 0AE0 to 0x00 0AEF	16	Yes
ADC registers (0 wait read only)	0x00 0B00 to 0x00 0B0F	16	No
CPU-TIMER0/1/2 Registers	0x00 0C00 to 0x00 0C3F	64	No
PIE Registers	0x00 0CE0 to 0x00 0CFF	32	No
PIE Vector Table	0x00 0D00 to 0x00 0DFF	256	No

- (1) Registers in Frame 0 support 16-bit and 32-bit accesses.
- (2) If registers are EALLOW protected, then writes cannot be performed until the EALLOW instruction is executed. The EDIS instruction disables writes to prevent stray code or pointers from corrupting register contents.
- (3) The Flash Registers are also protected by the Code Security Module (CSM).

Table 9-9. Peripheral Frame 1 Registers

NAME	ADDRESS RANGE	SIZE (×16)	EALLOW PROTECTED
Comparator 1 registers	0x00 6400 to 0x00 641F	32	(1)

9.5 VREG/BOR/POR

Although the core and I/O circuitry operate on two different voltages, these devices have an on-chip voltage regulator (VREG) to generate the V_{DD} voltage from the V_{DDIO} supply. This eliminates the cost and space of a second external regulator on an application board. Additionally, internal power-on reset (POR) and brown-out reset (BOR) circuits monitor both the V_{DD} and V_{DDIO} rails during power-up and run mode.

9.5.1 On-chip Voltage Regulator (VREG)

A linear regulator generates the core voltage (V_{DD}) from the V_{DDIO} supply. Therefore, although capacitors are required on each V_{DD} pin to stabilize the generated voltage, power need not be supplied to these pins to operate the device. Conversely, the VREG can be disabled, should power or redundancy be the primary concern of the application.

9.5.1.1 Using the On-chip VREG

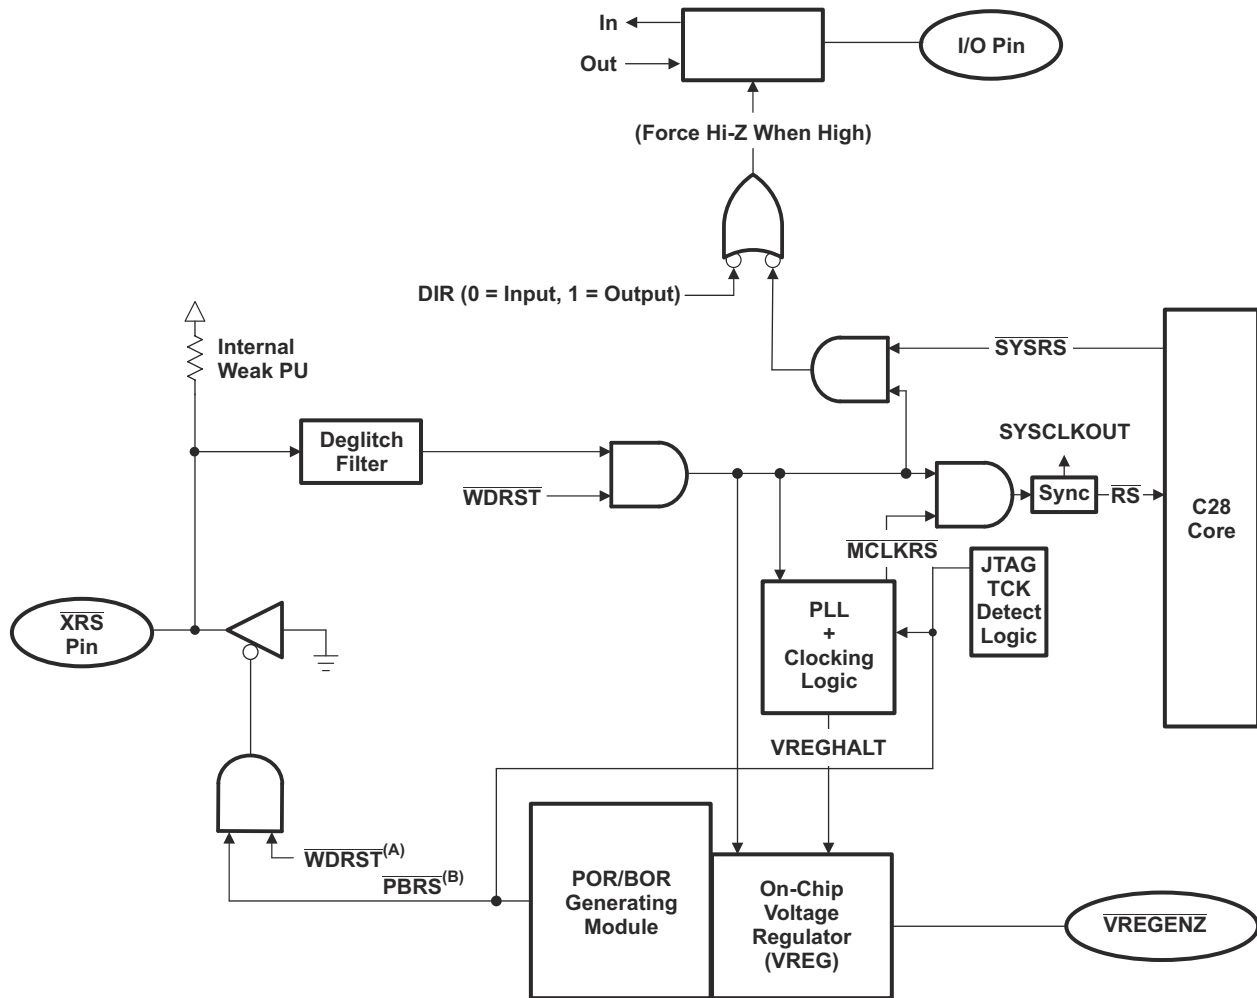

To use the on-chip VREG, the $\overline{\text{VREGENZ}}$ pin should be tied low and the appropriate recommended operating voltage should be supplied to the V_{DDIO} and V_{DDA} pins. In this case, the V_{DD} voltage needed by the core logic will be generated by the VREG. Each V_{DD} pin requires on the order of 1.2 μF (minimum) capacitance for proper regulation of the VREG. These capacitors should be located as close as possible to the V_{DD} pins. Driving an external load with the internal VREG is not supported.

9.5.1.2 Disabling the On-chip VREG

To conserve power, it is also possible to disable the on-chip VREG and supply the core logic voltage to the V_{DD} pins with a more efficient external regulator. To enable this option, the $\overline{\text{VREGENZ}}$ pin must be tied high.

9.5.2 On-chip Power-On Reset (POR) and Brown-Out Reset (BOR) Circuit

Two on-chip supervisory circuits, the power-on reset (POR) and the brown-out reset (BOR) remove the burden of monitoring the V_{DD} and V_{DDIO} supply rails from the application board. The purpose of the POR is to create a clean reset throughout the device during the entire power-up procedure. The trip point is a looser, lower trip point than the BOR, which watches for dips in the V_{DD} or V_{DDIO} rail during device operation. The POR function is present on both V_{DD} and V_{DDIO} rails at all times. After initial device power-up, the BOR function is present on V_{DDIO} at all times, and on V_{DD} when the internal VREG is enabled ($\overline{VREGENZ}$ pin is tied low). Both functions tie the \overline{XRS} pin low when one of the voltages is below their respective trip point. V_{DD} BOR and overvoltage trip points are outside of the recommended operating voltages. Proper device operation cannot be ensured. If overvoltage or undervoltage conditions affecting the system is a concern for an application, an external voltage supervisor should be added. Figure 9-6 shows the VREG, POR, and BOR. To disable both the V_{DD} and V_{DDIO} BOR functions, a bit is provided in the BORCFG register. For details, see the System Control chapter in the *TMS320F2802x, TMS320F2802xx Technical Reference Manual*.

- A. \overline{WDRST} is the reset signal from the CPU watchdog.
- B. \overline{PBRST} is the reset signal from the POR/BOR module.

Figure 9-6. VREG + POR + BOR + Reset Signal Connectivity

9.6 System Control

This section describes the oscillator and clocking mechanisms, the watchdog function and the low-power modes.

Table 9-12. PLL, Clocking, Watchdog, and Low-Power Mode Registers

NAME	ADDRESS	SIZE (x16)	DESCRIPTION ⁽¹⁾

WDCR	0x00 7029	1	Watchdog Control Register

(1) All registers in this table are EALLOW protected.

Figure 9-7 shows the various clock domains that are discussed. Figure 9-8 shows the various clock sources (both internal and external) that can provide a clock for device operation.

A. CLKIN is the clock into the CPU. It is passed out of the CPU as SYSCLKOUT (that is, CLKIN is the same frequency as SYSCLKOUT).

Figure 9-7. Clock and Reset Domains

- A. Register loaded from TI OTP-based calibration function.
B. See Section 9.6.4 for details on missing clock detection.

Figure 9-8. Clock Tree

9.6.1 Internal Zero Pin Oscillators

The F2802x devices contain two independent internal zero pin oscillators. By default both oscillators are turned on at power up, and internal oscillator 1 is the default clock source at this time. For power savings, unused oscillators may be powered down by the user. The center frequency of these oscillators is determined by their respective oscillator trim registers, written to in the calibration routine as part of the boot ROM execution. See [Section 8](#), Electrical Specifications, for more information on these oscillators.

9.6.2 Crystal Oscillator Option

The on-chip crystal oscillator X1 and X2 pins are 1.8-V level signals and must never have 3.3-V level signals applied to them. If a system 3.3-V external oscillator is to be used as a clock source, it should be connected to the XCLKIN pin only. The X1 pin is not intended to be used as a single-ended clock input, it should be used with X2 and a crystal.

The typical specifications for the external quartz crystal (fundamental mode, parallel resonant) are listed in [Table 9-13](#). Furthermore, ESR range = 30 to 150 Ω .

Table 9-13. Typical Specifications for External Quartz Crystal ⁽¹⁾

FREQUENCY (MHz)	R _d (Ω)	C _{L1} (pF)	C _{L2} (pF)
5	2200	18	18
10	470	15	15
15	0	15	15
20	0	12	12

(1) C_{shunt} should be less than or equal to 5 pF.

A. X1/X2 pins are available in 48-pin package only.

Figure 9-9. Using the On-chip Crystal Oscillator

Note

1. C_{L1} and C_{L2} are the total capacitance of the circuit board and components excluding the IC and crystal. The value is usually approximately twice the value of the crystal's load capacitance.
2. The load capacitance of the crystal is described in the crystal specifications of the manufacturers.
3. TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the MCU chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will produce proper start-up and stability over the entire operating range.

Figure 9-10. Using a 3.3-V External Oscillator

9.6.3 PLL-Based Clock Module

The devices have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 4-bit ratio control PLLCR[DIV] to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. It can be re-enabled (if need be) after the PLL module has stabilized, which takes 1 ms. The input clock and PLLCR[DIV] bits should be chosen in such a way that the output frequency of the PLL (VCOCLK) is at least 50 MHz.

Table 9-14. PLL Settings

PLLCR[DIV] VALUE ^{(2) (3)}	SYSCLKOUT (CLKIN)		
	PLLSTS[DIVSEL] = 0 or 1 ⁽¹⁾	PLLSTS[DIVSEL] = 2	PLLSTS[DIVSEL] = 3
0000 (PLL bypass)	OSCCLK/4 (Default) ⁽²⁾	OSCCLK/2	OSCCLK
0001	(OSCCLK * 1)/4	(OSCCLK * 1)/2	(OSCCLK * 1)/1
0010	(OSCCLK * 2)/4	(OSCCLK * 2)/2	(OSCCLK * 2)/1
0011	(OSCCLK * 3)/4	(OSCCLK * 3)/2	(OSCCLK * 3)/1
0100	(OSCCLK * 4)/4	(OSCCLK * 4)/2	(OSCCLK * 4)/1
0101	(OSCCLK * 5)/4	(OSCCLK * 5)/2	(OSCCLK * 5)/1
0110	(OSCCLK * 6)/4	(OSCCLK * 6)/2	(OSCCLK * 6)/1
0111	(OSCCLK * 7)/4	(OSCCLK * 7)/2	(OSCCLK * 7)/1
1000	(OSCCLK * 8)/4	(OSCCLK * 8)/2	(OSCCLK * 8)/1
1001	(OSCCLK * 9)/4	(OSCCLK * 9)/2	(OSCCLK * 9)/1
1010	(OSCCLK * 10)/4	(OSCCLK * 10)/2	(OSCCLK * 10)/1
1011	(OSCCLK * 11)/4	(OSCCLK * 11)/2	(OSCCLK * 11)/1
1100	(OSCCLK * 12)/4	(OSCCLK * 12)/2	(OSCCLK * 12)/1

- (1) By default, PLLSTS[DIVSEL] is configured for /4. (The boot ROM changes this to /1.) PLLSTS[DIVSEL] must be 0 before writing to the PLLCR and should be changed only after PLLSTS[PLLLOCKS] = 1.
- (2) The PLL control register (PLLCR) and PLL Status Register (PLLSTS) are reset to their default state by the \overline{XRS} signal or a watchdog reset only. A reset issued by the debugger or the missing clock detect logic has no effect.
- (3) This register is EALLOW protected. See the System Control chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) for more information.

Table 9-15. CLKIN Divide Options

PLLSTS [DIVSEL]	CLKIN DIVIDE
0	/4
1	/4
2	/2
3	/1

The PLL-based clock module provides four modes of operation:

- **INTOSC1 (Internal Zero-pin Oscillator 1):** This is the on-chip internal oscillator 1. This can provide the clock for the Watchdog block, core and CPU-Timer 2
- **INTOSC2 (Internal Zero-pin Oscillator 2):** This is the on-chip internal oscillator 2. This can provide the clock for the Watchdog block, core and CPU-Timer 2. Both INTOSC1 and INTOSC2 can be independently chosen for the Watchdog block, core and CPU-Timer 2.
- **Crystal/Resonator Operation:** The on-chip (crystal) oscillator enables the use of an external crystal/resonator attached to the device to provide the time base. The crystal/resonator is connected to the X1/X2 pins. Some devices may not have the X1/X2 pins. See [Section 7.2.1](#) for details.
- **External Clock Source Operation:** If the on-chip (crystal) oscillator is not used, this mode allows it to be bypassed. The device clocks are generated from an external clock source input on the XCLKIN pin. The XCLKIN is multiplexed with GPIO19 or GPIO38 pin. The XCLKIN input can be selected as GPIO19 or GPIO38 through the XCLKINSEL bit in XCLK register. The CLKCTL[XCLKINOFF] bit disables this clock input (forced low). If the clock source is not used or the respective pins are used as GPIOs, the user should disable at boot time.

Before changing clock sources, ensure that the target clock is present. If a clock is not present, then that clock source must be disabled (using the CLKCTL register) before switching clocks.

Table 9-16. Possible PLL Configuration Modes

PLL MODE	REMARKS	PLLSTS[DIVSEL]	CLKIN AND SYSCCLKOUT
PLL Off	Invoked by the user setting the PLOFF bit in the PLLSTS register. The PLL block is disabled in this mode. This can be useful to reduce system noise and for low-power operation. The PLLCR register must first be set to 0x0000 (PLL Bypass) before entering this mode. The CPU clock (CLKIN) is derived directly from the input clock on either X1/X2, X1 or XCLKIN.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Bypass	PLL Bypass is the default PLL configuration upon power-up or after an external reset (XRS). This mode is selected when the PLLCR register is set to 0x0000 or while the PLL locks to a new frequency after the PLLCR register has been modified. In this mode, the PLL is bypassed but the PLL is not turned off.	0, 1 2 3	OSCCLK/4 OSCCLK/2 OSCCLK/1
PLL Enable	Achieved by writing a nonzero value n into the PLLCR register. Upon writing to the PLLCR the device will switch to PLL Bypass mode until the PLL locks.	0, 1 2 3	OSCCLK * n/4 OSCCLK * n/2 OSCCLK * n/1

9.6.4 Loss of Input Clock (NMI Watchdog Function)

The 2802x devices may be clocked from either one of the internal zero-pin oscillators (INTOSC1/INTOSC2), the on-chip crystal oscillator, or from an external clock input. Regardless of the clock source, in PLL-enabled and PLL-bypass mode, if the input clock to the PLL vanishes, the PLL will issue a limp-mode clock at its output. This limp-mode clock continues to clock the CPU and peripherals at a typical frequency of 1–5 MHz.

When the limp mode is activated, a $\overline{\text{CLOCKFAIL}}$ signal is generated that is latched as an NMI interrupt. Depending on how the NMIRESETSEL bit has been configured, a reset to the device can be fired immediately or the NMI watchdog counter can issue a reset when it overflows. In addition to this, the Missing Clock Status (MCLKSTS) bit is set. The NMI interrupt could be used by the application to detect the input clock failure and initiate necessary corrective action such as switching over to an alternative clock source (if available) or initiate a shut-down procedure for the system.

If the software does not respond to the clock-fail condition, the NMI watchdog triggers a reset after a preprogrammed time interval. [Figure 9-11](#) shows the interrupt mechanisms involved.

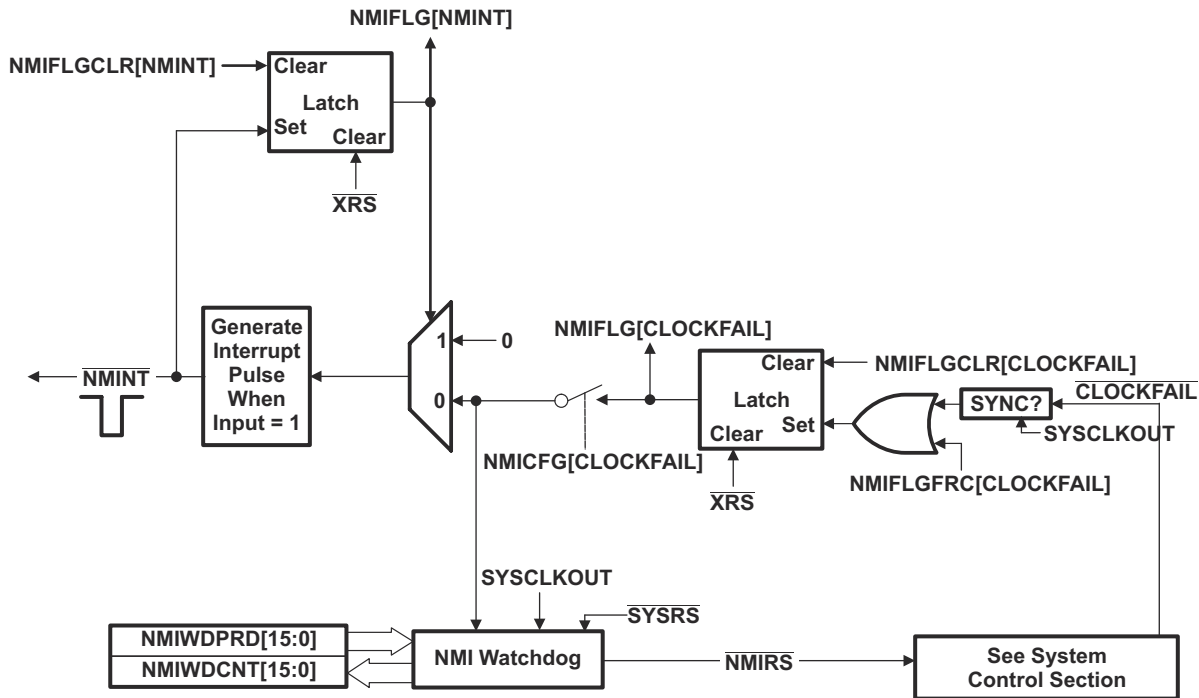

Figure 9-11. NMI Watchdog

9.6.5 CPU Watchdog Module

The CPU watchdog module on the 2802x device is similar to the one used on the 281x/280x/283xx devices. This module generates an output pulse, 512 oscillator clocks wide (OSCCLK), whenever the 8-bit watchdog up counter has reached its maximum value. To prevent this, the user must disable the counter or the software must periodically write a 0x55 + 0xAA sequence into the watchdog key register that resets the watchdog counter. [Figure 9-12](#) shows the various functional blocks within the watchdog module.

Normally, when the input clocks are present, the CPU watchdog counter decrements to initiate a CPU watchdog reset or WDINT interrupt. However, when the external input clock fails, the CPU watchdog counter stops decrementing (that is, the watchdog counter does not change with the limp-mode clock).

Note

The CPU watchdog is different from the NMI watchdog. It is the legacy watchdog that is present in all 28x devices.

Note

Applications in which the correct CPU operating frequency is absolutely critical should implement a mechanism by which the MCU will be held in reset, should the input clocks ever fail. For example, an R-C circuit may be used to trigger the XRS pin of the MCU, should the capacitor ever get fully charged. An I/O pin may be used to discharge the capacitor on a periodic basis to prevent it from getting fully charged. Such a circuit would also help in detecting failure of the flash memory.

A. The $\overline{\text{WDRST}}$ signal is driven low for 512 OSCCLK cycles.

Figure 9-12. CPU Watchdog Module

The $\overline{\text{WDINT}}$ signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the CPU watchdog. This module will run off OSCCLK. The $\overline{\text{WDINT}}$ signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See [Section 9.7](#), Low-power Modes Block, for more details.

In IDLE mode, the $\overline{\text{WDINT}}$ signal can generate an interrupt to the CPU, through the PIE, to take the CPU out of IDLE mode.

In HALT mode, the CPU watchdog can be used to wake up the device through a device reset.

9.7 Low-power Modes Block

Table 9-17 summarizes the various modes.

Table 9-17. Low-power Modes

MODE	LPMCR0(1:0)	OSCCLK	CLKIN	SYSCLKOUT	EXIT ⁽¹⁾
IDLE	00	On	On	On	\overline{XRS} , CPU watchdog interrupt, any enabled interrupt
STANDBY	01	On (CPU watchdog still running)	Off	Off	\overline{XRS} , CPU watchdog interrupt, GPIO Port A signal, debugger ⁽²⁾
HALT ⁽³⁾	1X	Off (on-chip crystal oscillator and PLL turned off, zero-pin oscillator and CPU watchdog state dependent on user code.)	Off	Off	\overline{XRS} , GPIO Port A signal, debugger ⁽²⁾ , CPU watchdog

- (1) The EXIT column lists which signals or under what conditions the low-power mode is exited. A low signal, on any of the signals, exits the low-power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise, the low-power mode will not be exited and the device will go back into the indicated low-power mode.
- (2) The JTAG port can still function even if the CPU clock (CLKIN) is turned off.
- (3) The WDCLK must be active for the device to go into HALT mode.

The various low-power modes operate as follows:

IDLE Mode:	This mode is exited by any enabled interrupt that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.
STANDBY Mode:	Any GPIO port A signal (GPIO[31:0]) can wake the device from STANDBY mode. The user must select which signal(s) will wake the device in the GPIOLPMSEL register. The selected signal(s) are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register.
HALT Mode:	CPU watchdog, \overline{XRS} , and any GPIO port A signal (GPIO[31:0]) can wake the device from HALT mode. The user selects the signal in the GPIOLPMSEL register.

Note

The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed. See the System Control chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) for more details.

9.8 Interrupts

Figure 9-13 shows how the various interrupt sources are multiplexed.

Figure 9-13. External and PIE Interrupt Sources

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. Table 9-18 shows the interrupts used by 2802x devices.

The TRAP #VectorNumber instruction transfers program control to the interrupt service routine corresponding to the vector specified. The TRAP #0 instruction attempts to transfer program control to the address pointed to by the reset vector. The PIE vector table does not, however, include a reset vector. Therefore, the TRAP #0 instruction should not be used when the PIE is enabled. Doing so will result in undefined behavior.

When the PIE is enabled, the TRAP #1 to TRAP #12 instructions will transfer program control to the interrupt service routine corresponding to the first vector within the PIE group. For example: the TRAP #1 instruction fetches the vector from INT1.1, the TRAP #2 instruction fetches the vector from INT2.1, and so forth.

Figure 9-14. Multiplexing of Interrupts Using the PIE Block

- (1) Out of 96 possible interrupts, some interrupts are not used. These interrupts are reserved for future devices. These interrupts can be used as software interrupts if they are enabled at the PIEIFRx level, provided none of the interrupts within the group is being used by a peripheral. Otherwise, interrupts coming in from peripherals may be lost by accidentally clearing their flag while modifying the PIEIFR. To summarize, there are two safe cases when the reserved interrupts could be used as software interrupts:
- No peripheral within the group is asserting interrupts.
 - No peripheral interrupts are assigned to the group (for example, PIE groups 5, 7, or 11) .

Figure 9-15. External Interrupt Timing

9.9 Peripherals

9.9.1 Analog Block

A 12-bit ADC core is implemented that has different timings than the 12-bit ADC used on F280x/F2833x. The ADC wrapper is modified to incorporate the new timings and also other enhancements to improve the timing control of start of conversions. Figure 9-16 shows the interaction of the analog module with the rest of the F2802x system.

For more information on the ADC, see the Analog-to-Digital Converter and Comparator chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

A. Comparator 2 is available only on the 48-pin PT package.

Figure 9-16. Analog Pin Configurations

9.9.1.1 Analog-to-Digital Converter (ADC)

9.9.1.1.1 Features

The core of the ADC contains a single 12-bit converter fed by two sample-and-hold circuits. The sample-and-hold circuits can be sampled simultaneously or sequentially. These, in turn, are fed by a total of up to 13 analog input channels. The converter can be configured to run with an internal band-gap reference to create true-voltage based conversions or with a pair of external voltage references (V_{REFHI}/V_{REFLO}) to create ratiometric-based conversions.

Contrary to previous ADC types, this ADC is not sequencer-based. It is easy for the user to create a series of conversions from a single trigger. However, the basic principle of operation is centered around the configurations of individual conversions, called SOCs, or Start-Of-Conversions.

Functions of the ADC module include:

- 12-bit ADC core with built-in dual sample-and-hold (S/H)
- Simultaneous sampling or sequential sampling modes
- Full range analog input: 0 V to 3.3 V fixed, or V_{REFHI}/V_{REFLO} ratiometric. The digital value of the input analog voltage is derived by:
 - Internal Reference ($V_{REFLO} = V_{SSA}$. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

Digital Value = 0, when input \leq 0 V

Digital Value = $4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{3.3}$ when $0 \text{ V} < \text{input} < 3.3 \text{ V}$

Digital Value = 4095, when input \geq 3.3 V

- External Reference (V_{REFHI}/V_{REFLO} connected to external references. V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes.)

Digital Value = 0, when input \leq 0 V

Digital Value = $4096 \times \frac{\text{Input Analog Voltage} - V_{REFLO}}{V_{REFHI} - V_{REFLO}}$ when $0 \text{ V} < \text{input} < V_{REFHI}$

Digital Value = 4095, when input $\geq V_{REFHI}$

- Up to 16-channel, multiplexed inputs
- 16 SOCs, configurable for trigger, sample window, and channel
- 16 result registers (individually addressable) to store conversion values
- Multiple trigger sources
 - S/W – software immediate start
 - ePWM 1–4
 - GPIO XINT2
 - CPU Timers 0/1/2
 - ADCINT1/2
- 9 flexible PIE interrupts, can configure interrupt request after any conversion

Figure 9-17. ADC Connections

ADC Connections if the ADC is Not Used

TI recommends keeping the connections for the analog power pins, even if the ADC is not used. Following is a summary of how the ADC pins should be connected, if the ADC is not used in an application:

- V_{DDA} – Connect to V_{DDIO}
- V_{SSA} – Connect to V_{SS}
- V_{REFLO} – Connect to V_{SS}
- $ADCINAn, ADCINBn, V_{REFHI}$ – Connect to V_{SSA}

When the ADC module is used in an application, unused ADC input pins should be connected to analog ground (V_{SSA}).

Note

Unused ADCIN pins that are multiplexed with AIO function should not be directly connected to analog ground. They should be grounded through a 1-kΩ resistor. This is to prevent an errant code from configuring these pins as AIO outputs and driving grounded pins to a logic-high state.

When the ADC is not used, be sure that the clock to the ADC module is not turned on to realize power savings.

9.9.1.1.2 ADC Start-of-Conversion Electrical Data/Timing

9.9.1.1.2.1 External ADC Start-of-Conversion Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
$t_{w(ADCSOCL)}$	Pulse duration, $\overline{ADCSOCxO}$ low	$32t_{c(HCO)}$		cycles

Figure 9-18. $\overline{ADCSOCAO}$ or $\overline{ADCSOCBO}$ Timing

9.9.1.1.3 On-Chip Analog-to-Digital Converter (ADC) Electrical Data/Timing

9.9.1.1.3.1 ADC Electrical Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
DC SPECIFICATIONS					
Resolution		12			Bits
ADC clock	60-MHz device	0.001		60	MHz
Sample Window	28027/26/23/22	7		64	ADC Clocks
	28021/20/200	14		64	
ACCURACY					
INL (Integral nonlinearity) at ADC Clock \leq 30 MHz ⁽¹⁾		-4		4	LSB
DNL (Differential nonlinearity) at ADC Clock \leq 30 MHz, no missing codes		-1		1	LSB
Offset error ⁽²⁾	Executing Device_Cal function	-20	0	20	LSB
	Executing periodic self-recalibration ⁽³⁾	-4	0	4	
Overall gain error with internal reference		-60		60	LSB
Overall gain error with external reference		-40		40	LSB
Channel-to-channel offset variation		-4		4	LSB
Channel-to-channel gain variation		-4		4	LSB
ADC temperature coefficient with internal reference			-50		ppm/°C
ADC temperature coefficient with external reference			-20		ppm/°C
V _{REFLO}			-100		μ A
V _{REFHI}			100		μ A
ANALOG INPUT					
Analog input voltage with internal reference		0		3.3	V
Analog input voltage with external reference		V _{REFLO}		V _{REFHI}	V
V _{REFLO} input voltage ⁽⁴⁾		V _{SSA}		V _{SSA}	V
V _{REFHI} input voltage ⁽⁵⁾	with V _{REFLO} = V _{SSA}	1.98		V _{DDA}	V
Input capacitance			5		pF
Input leakage current			\pm 5		μ A

- (1) INL will degrade when the ADC input voltage goes above V_{DDA}.
- (2) 1 LSB has the weighted value of full-scale range (FSR)/4096. FSR is 3.3 V with internal reference and V_{REFHI} - V_{REFLO} for external reference.
- (3) Periodic self-recalibration will remove system-level and temperature dependencies on the ADC zero offset error. This can be performed as needed in the application without sacrificing an ADC channel by using the procedure listed in the "ADC Zero Offset Calibration" section of the Analog-to-Digital Converter and Comparator chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).
- (4) V_{REFLO} is always connected to V_{SSA}.
- (5) V_{REFHI} must not exceed V_{DDA} when using either internal or external reference modes. Because V_{REFHI} is tied to ADCINA0, the input signal on ADCINA0 must not exceed V_{DDA}.

9.9.1.1.3.2 ADC Power Modes

ADC OPERATING MODE	CONDITIONS	I _{DDA}	UNITS
Mode A – Operating Mode	ADC Clock Enabled Band gap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWDN = 1)	13	mA
Mode B – Quick Wake Mode	ADC Clock Enabled Band gap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 1) ADC Powered Up (ADCPWDN = 0)	4	mA
Mode C – Comparator-Only Mode	ADC Clock Enabled Band gap On (ADCBGPWD = 1) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWDN = 0)	1.5	mA
Mode D – Off Mode	ADC Clock Enabled Band gap On (ADCBGPWD = 0) Reference On (ADCREFPWD = 0) ADC Powered Up (ADCPWDN = 0)	0.075	mA

9.9.1.1.3.3 Internal Temperature Sensor

9.9.1.1.3.3.1 Temperature Sensor Coefficient

PARAMETER ⁽¹⁾		MIN	TYP	MAX	UNIT
T _{SLOPE}	Degrees C of temperature movement per measured ADC LSB change of the temperature sensor		0.18 ⁽³⁾ (2)		°C/LSB
T _{OFFSET}	ADC output at 0°C of the temperature sensor		1750		LSB

- (1) The temperature sensor slope and offset are given in terms of ADC LSBs using the internal reference of the ADC. Values must be adjusted accordingly in external reference mode to the external reference voltage.
- (2) Output of the temperature sensor (in terms of LSBs) is sign-consistent with the direction of the temperature movement. Increasing temperatures will give increasing ADC values relative to an initial value; decreasing temperatures will give decreasing ADC values relative to an initial value.
- (3) ADC temperature coefficient is accounted for in this specification

9.9.1.1.3.4 ADC Power-Up Control Bit Timing

9.9.1.1.3.4.1 ADC Power-Up Delays

PARAMETER ⁽¹⁾		MIN	MAX	UNIT
t _{d(PWD)}	Delay time for the ADC to be stable after power up		1	ms

- (1) Timings maintain compatibility to the ADC module. The 2802x ADC supports driving all 3 bits at the same time t_{d(PWD)} ms before first conversion.

Figure 9-19. ADC Conversion Timing

Typical Values of the Input Circuit Components:

- Switch Resistance (R_{on}): 3.4 k Ω
- Sampling Capacitor (C_h): 1.6 pF
- Parasitic Capacitance (C_p): 5 pF
- Source Resistance (R_s): 50 Ω

Figure 9-20. ADC Input Impedance Model

9.9.1.1.3.5 ADC Sequential and Simultaneous Timings

Figure 9-21. Timing Example for Sequential Mode / Late Interrupt Pulse

Figure 9-22. Timing Example for Sequential Mode / Early Interrupt Pulse

Figure 9-23. Timing Example for Simultaneous Mode / Late Interrupt Pulse

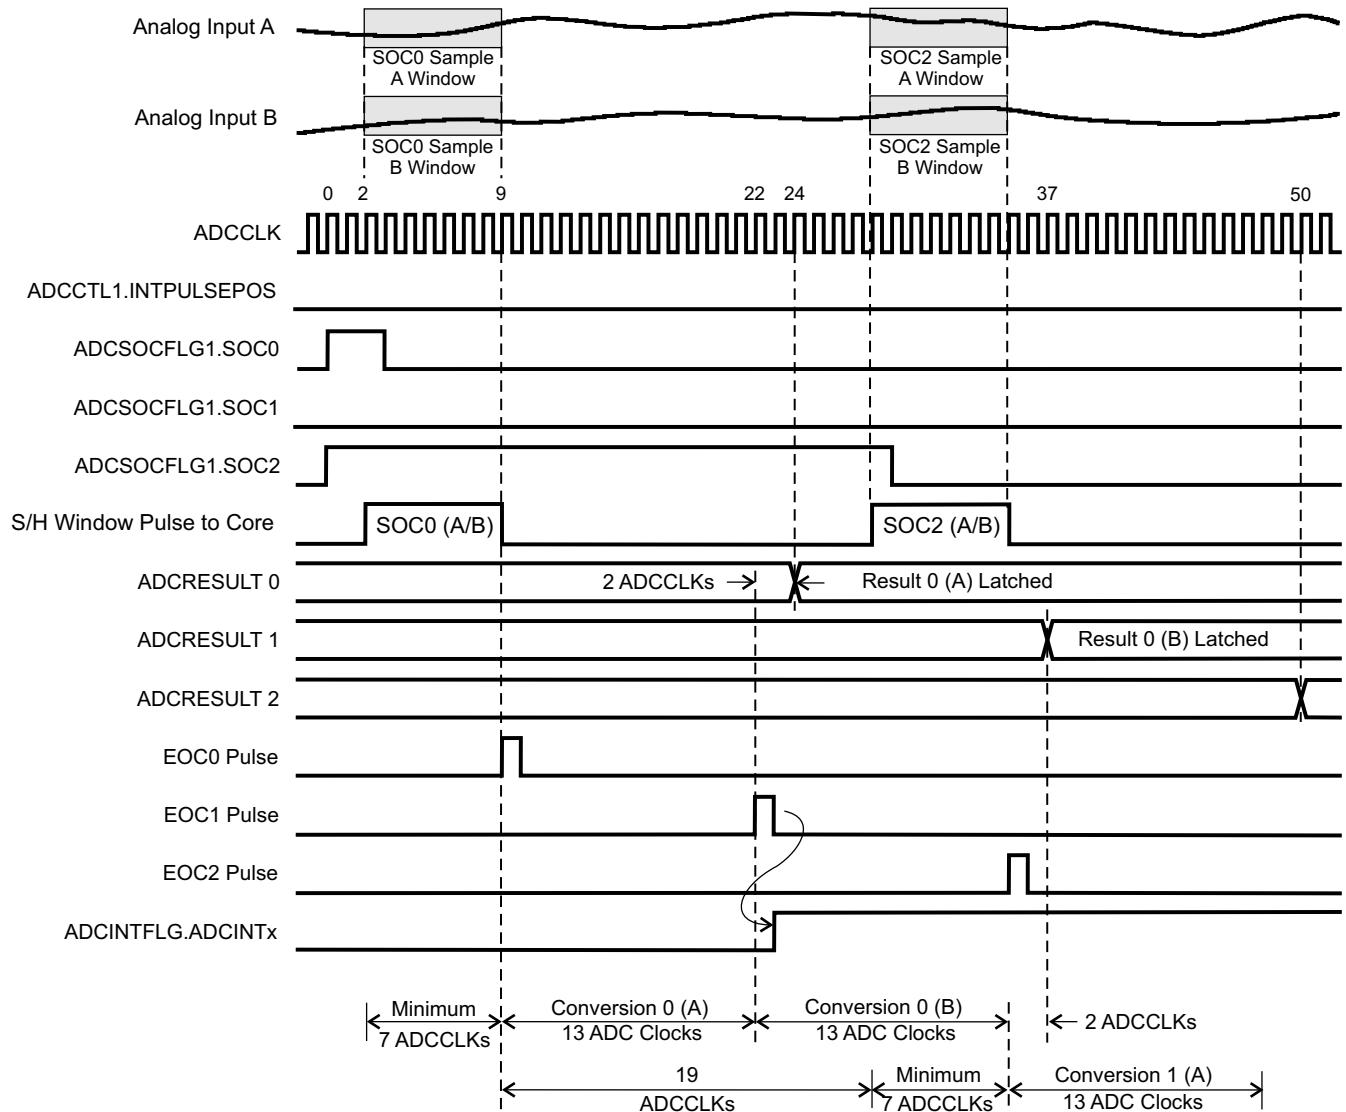

Figure 9-24. Timing Example for Simultaneous Mode / Early Interrupt Pulse

9.9.1.2 ADC MUX

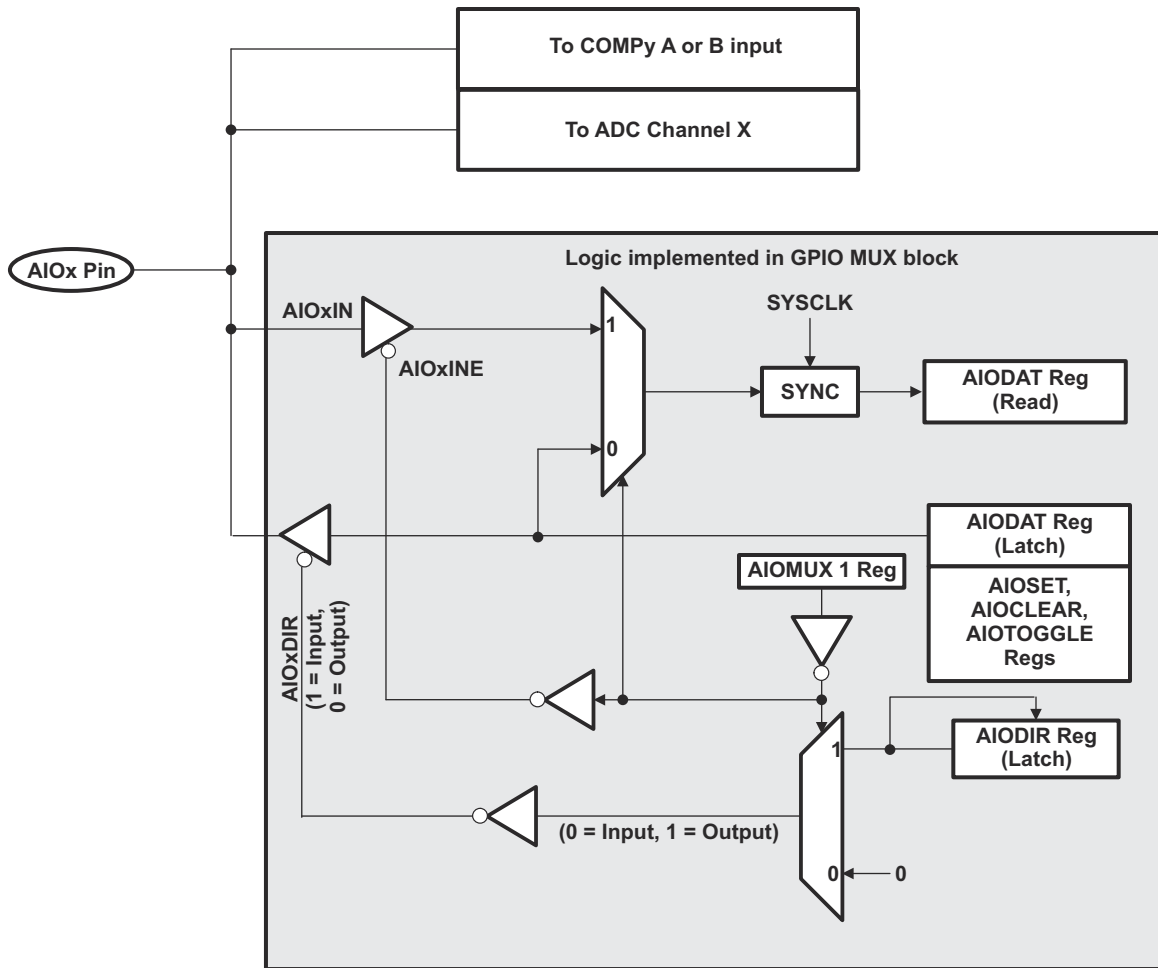

Figure 9-25. AIOx Pin Multiplexing

The ADC channel and Comparator functions are always available. The digital I/O function is available only when the respective bit in the AIOMUX1 register is 0. In this mode, reading the AIODAT register reflects the actual pin state.

The digital I/O function is disabled when the respective bit in the AIOMUX1 register is 1. In this mode, reading the AIODAT register reflects the output latch of the AIODAT register and the input digital I/O buffer is disabled to prevent analog signals from generating noise.

On reset, the digital function is disabled. If the pin is used as an analog input, users should keep the AIO function disabled for that pin.

9.9.1.3 Comparator Block

Figure 9-26 shows the interaction of the Comparator modules with the rest of the system.

Figure 9-26. Comparator Block Diagram

Table 9-23. Comparator Control Registers

REGISTER NAME	COMP1 ADDRESS	COMP2 ADDRESS ⁽¹⁾	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
COMPCTL	0x6400	0x6420	1	Yes	Comparator Control Register
COMPSTS	0x6402	0x6422	1	No	Comparator Status Register
DACCTL	0x6404	0x6424	1	Yes	DAC Control Register
DACVAL	0x6406	0x6426	1	No	DAC Value Register
RAMPMAXREF_ACTIVE	0x6408	0x6428	1	No	Ramp Generator Maximum Reference (Active) Register
RAMPMAXREF_SHDW	0x640A	0x642A	1	No	Ramp Generator Maximum Reference (Shadow) Register
RAMPDECVAL_ACTIVE	0x640C	0x642C	1	No	Ramp Generator Decrement Value (Active) Register
RAMPDECVAL_SHDW	0x640E	0x642E	1	No	Ramp Generator Decrement Value (Shadow) Register
RAMPSTS	0x6410	0x6430	1	No	Ramp Generator Status Register

(1) Comparator 2 is available only on the 48-pin PT package.

9.9.1.3.1 On-Chip Comparator/DAC Electrical Data/Timing

9.9.1.3.1.1 Electrical Characteristics of the Comparator/DAC

PARAMETER	MIN	TYP	MAX	UNITS
Comparator				
Comparator Input Range		$V_{SSA} - V_{DDA}$		V
Comparator response time to PWM Trip Zone (Async)		30		ns
Input Offset		±5		mV
Input Hysteresis ⁽¹⁾		35		mV
DAC				
DAC Output Range		$V_{SSA} - V_{DDA}$		V
DAC resolution		10		bits
DAC settling time		See Figure 9-27		
DAC Gain		-1.5%		
DAC Offset		10		mV
Monotonic		Yes		
INL		±3		LSB

- (1) Hysteresis on the comparator inputs is achieved with a Schmidt trigger configuration. This results in an effective 100-kΩ feedback resistance between the output of the comparator and the noninverting input of the comparator. There is an option to disable the hysteresis and, with it, the feedback resistance; see the Analog-to-Digital Converter and Comparator chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) for more information on this option if needed in your system.

Figure 9-27. DAC Settling Time

9.9.2 Detailed Descriptions

Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero to full scale. The point used as zero occurs one-half LSB before the first code transition. The full-scale point is defined as level one-half LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ± 1 LSB ensures no missing codes.

Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

Gain Error

The first code transition should occur at an analog value one-half LSB above negative full scale. The last transition should occur at an analog value one and one-half LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula, $N = \frac{(\text{SINAD} - 1.76)}{6.02}$ it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first nine harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

9.9.3 Serial Peripheral Interface (SPI) Module

The device includes the four-pin serial peripheral interface (SPI) module. One SPI module (SPI-A) is available. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (1 to 16 bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the MCU and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
 - SPISOMI: SPI slave-output/master-input pin
 - SPISIMO: SPI slave-input/master-output pin
 - $\overline{\text{SPISTE}}$: SPI slave transmit-enable pin
 - SPICLK: SPI serial-clock pin

Note

All four pins can be used as GPIO if the SPI module is not used.

- Two operational modes: master and slave

Baud rate: 125 different programmable rates.

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)} \quad \text{when SPIBRR} = 3 \text{ to } 127$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{4} \quad \text{when SPIBRR} = 0, 1, 2$$

- Data word length: 1 to 16 data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
 - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the rising edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: In control register frame beginning at address 7040h.

Note

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced feature:

- 4-level transmit/receive FIFO
- Delayed transmit control
- Bidirectional 3 wire SPI mode support

The SPI port operation is configured and controlled by the registers listed in [Table 9-24](#) .

Table 9-24. SPI-A Registers

NAME	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION ⁽¹⁾
SPICCR	0x7040	1	No	SPI-A Configuration Control Register
SPICTL	0x7041	1	No	SPI-A Operation Control Register
SPISTS	0x7042	1	No	SPI-A Status Register
SPIBRR	0x7044	1	No	SPI-A Baud Rate Register
SPIRXEMU	0x7046	1	No	SPI-A Receive Emulation Buffer Register
SPIRXBUF	0x7047	1	No	SPI-A Serial Input Buffer Register
SPITXBUF	0x7048	1	No	SPI-A Serial Output Buffer Register
SPIDAT	0x7049	1	No	SPI-A Serial Data Register
SPIFFTX	0x704A	1	No	SPI-A FIFO Transmit Register
SPIFFRX	0x704B	1	No	SPI-A FIFO Receive Register
SPIFFCT	0x704C	1	No	SPI-A FIFO Control Register
SPIPRI	0x704F	1	No	SPI-A Priority Control Register

(1) Registers in this table are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

For more information on the SPI, see the Serial Peripheral Interface (SPI) chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) .

9.9.3.1 SPI Master Mode Electrical Data/Timing

Section 9.9.3.1.1 lists the master mode timing (clock phase = 0) and Section 9.9.3.1.2 lists the master mode timing (clock phase = 1). Figure 9-29 and Figure 9-30 show the timing waveforms.

9.9.3.1.1 SPI Master Mode External Timing (Clock Phase = 0)

NO. ⁽¹⁾ (2) (3) (4) (5)	PARAMETER	BRR EVEN		BRR ODD		UNIT

Figure 9-30. SPI Master Mode External Timing (Clock Phase = 1)

9.9.4 Serial Communications Interface (SCI) Module

The devices include one serial communications interface (SCI) module (SCI-A). The SCI module supports digital communications between the CPU and other asynchronous peripherals that use the standard nonreturn-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
 - SCITXD: SCI transmit-output pin
 - SCIRXD: SCI receive-input pin

Note

Both pins can be used as GPIO if not used for SCI.

- Baud rate programmable to 64K different rates:

$$\text{Baud rate} = \frac{\text{LSPCLK}}{(\text{BRR} + 1) * 8} \quad \text{when BRR} \neq 0$$

$$\text{Baud rate} = \frac{\text{LSPCLK}}{16} \quad \text{when BRR} = 0$$

- Data-word format
 - One start bit
 - Data-word length programmable from 1 to 8 bits
 - Optional even/odd/no parity bit
 - One or 2 stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
 - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
 - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- NRZ (nonreturn-to-zero) format

Note

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced features:

- Auto baud-detect hardware logic
- 4-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in [Table 9-25](#).

Table 9-25. SCI-A Registers

NAME ⁽¹⁾	ADDRESS	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
SCICCRA	0x7050	1	No	SCI-A Communications Control Register
SCICTL1A	0x7051	1	No	SCI-A Control Register 1
SCIHBAUDA	0x7052	1	No	SCI-A Baud Register, High Bits
SCILBAUDA	0x7053	1	No	SCI-A Baud Register, Low Bits
SCICTL2A	0x7054	1	No	SCI-A Control Register 2
SCIRXSTA	0x7055	1	No	SCI-A Receive Status Register
SCIRXEMUA	0x7056	1	No	SCI-A Receive Emulation Data Buffer Register
SCIRXBUFA	0x7057	1	No	SCI-A Receive Data Buffer Register
SCITXBUFA	0x7059	1	No	SCI-A Transmit Data Buffer Register
SCIFFTXA ⁽²⁾	0x705A	1	No	SCI-A FIFO Transmit Register
SCIFFRXA ⁽²⁾	0x705B	1	No	SCI-A FIFO Receive Register
SCIFFCTA ⁽²⁾	0x705C	1	No	SCI-A FIFO Control Register
SCIPRIA	0x705F	1	No	SCI-A Priority Control Register

- (1) Registers in this table are mapped to Peripheral Frame 2 space. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.
- (2) These registers are new registers for the FIFO mode.

For more information on the SCI, see the Serial Communications Interface (SCI) chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

[Figure 9-33](#) shows the SCI module block diagram.

Figure 9-33. Serial Communications Interface (SCI) Module Block Diagram

9.9.5 Inter-Integrated Circuit (I2C)

The device contains one I2C Serial Port. [Figure 9-34](#) shows how the I2C peripheral module interfaces within the device.

The I2C module has the following features:

- Compliance with the Philips Semiconductors I²C-bus specification (version 2.1):
 - Support for 1-bit to 8-bit format transfers
 - 7-bit and 10-bit addressing modes
 - General call
 - START byte mode
 - Support for multiple master-transmitters and slave-receivers
 - Support for multiple slave-transmitters and master-receivers
 - Combined master transmit/receive and receive/transmit mode
 - Data transfer rate of from 10 kbps up to 400 kbps (I2C Fast-mode rate)
- One 4-word receive FIFO and one 4-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
 - Transmit-data ready
 - Receive-data ready
 - Register-access ready
 - No-acknowledgment received
 - Arbitration lost
 - Stop condition detected
 - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable/disable capability
- Free data format mode

For more information on the I2C, see the Inter-Integrated Circuit Module (I2C) chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

- The I2C registers are accessed at the SYSCLKOUT rate. The internal timing and signal waveforms of the I2C port are also at the SYSCLKOUT rate.
- The clock enable bit (I2CAENCLK) in the PCLKCRO register turns off the clock to the I2C port for low-power operation. Upon reset, I2CAENCLK is clear, which indicates the peripheral internal clocks are off.

Figure 9-34. I2C Peripheral Module Interfaces

The registers in [Table 9-26](#) configure and control the I2C port operation.

Table 9-26. I2C-A Registers

NAME	ADDRESS	EALLOW PROTECTED	DESCRIPTION

9.9.5.1 I2C Electrical Data/Timing

Section 9.9.5.1.1 shows the I2C timing requirements. Section 9.9.5.1.2 shows the I2C switching characteristics.

9.9.5.1.1 I2C Timing Requirements

		MIN	MAX	UNIT	
$t_{h(SDA-SCL)START}$	Hold time, START condition, SCL fall delay after SDA fall	0.6		μs	
$t_{su(SCL-SDA)START}$	Setup time, Repeated START, SCL rise before SDA fall delay	0.6		μs	
$t_{h(SCL-DAT)}$	Hold time, data after SCL fall	0		μs	
$t_{su(DAT-SCL)}$	Setup time, data before SCL rise	100		ns	
$t_{r(SDA)}$	Rise time, SDA	Input tolerance	20	300	ns
$t_{r(SCL)}$	Rise time, SCL	Input tolerance	20	300	ns
$t_{f(SDA)}$	Fall time, SDA	Input tolerance	11.4	300	ns
$t_{f(SCL)}$	Fall time, SCL	Input tolerance	11.4	300	ns
$t_{su(SCL-SDA)STOP}$	Setup time, STOP condition, SCL rise before SDA rise delay	0.6		μs	

9.9.5.1.2 I2C Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
f_{SCL}	SCL clock frequency	I2C clock module frequency is from 7 MHz to 12 MHz and I2C prescaler and clock divider registers are configured appropriately.		400	kHz
V_{il}	Low level input voltage			$0.3 V_{DDIO}$	V
V_{ih}	High level input voltage		$0.7 V_{DDIO}$		V
V_{hys}	Input hysteresis		$0.05 V_{DDIO}$		V
V_{ol}	Low level output voltage	3-mA sink current	0	0.4	V
t_{LOW}	Low period of SCL clock	I2C clock module frequency is from 7 MHz to 12 MHz and I2C prescaler and clock divider registers are configured appropriately.	1.3		μs
t_{HIGH}	High period of SCL clock	I2C clock module frequency is from 7 MHz to 12 MHz and I2C prescaler and clock divider registers are configured appropriately.	0.6		μs
I_I	Input current with an input voltage from $0.1 V_{DDIO}$ to $0.9 V_{DDIO} MAX$		-10	10	μA

9.9.6 Enhanced PWM Modules (ePWM1/2/3/4)

The devices contain up to four enhanced PWM Modules (ePWM). Figure 9-35 shows a block diagram of multiple ePWM modules. Figure 9-36 shows the signal interconnections with the ePWM. For more details, see the Enhanced Pulse Width Modulator (ePWM) chapter in the *TMS320F2802x, TMS320F2802xx Technical Reference Manual*.

Table 9-27 shows the complete ePWM register set per module.

A. These events are generated by the Type 1 ePWM digital compare (DC) submodule based on the levels of the COMPxOUT and TZ signals.

Figure 9-36. ePWM Submodules Showing Critical Internal Signal Interconnections

9.9.6.1 ePWM Electrical Data/Timing

PWM refers to PWM outputs on ePWM1–4. Section 9.9.6.1.1 shows the PWM timing requirements and Section 9.9.6.1.2, switching characteristics.

9.9.6.1.1 ePWM Timing Requirements

		MIN ⁽¹⁾	MAX	UNIT
$t_{w(\text{SYCIN})}$	Sync input pulse width			
	Asynchronous	$2t_{c(\text{SCO})}$		cycles
	Synchronous	$2t_{c(\text{SCO})}$		cycles
	With input qualifier	$1t_{c(\text{SCO})} + t_{w(\text{IQSW})}$		cycles

(1) For an explanation of the input qualifier parameters, see Section 9.9.10.1.2.1.

9.9.6.1.2 ePWM Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(\text{PWM})}$	Pulse duration, PWMx output high/low	33.33		ns
$t_{w(\text{SYNCOUT})}$	Sync output pulse width	$8t_{c(\text{SCO})}$		cycles
$t_{d(\text{PWM})\text{Iza}}$	Delay time, trip input active to PWM forced high		25	ns
	Delay time, trip input active to PWM forced low	no pin load		
$t_{d(\text{TZ-PWM})\text{HZ}}$	Delay time, trip input active to PWM Hi-Z		20	ns

9.9.6.2 Trip-Zone Input Timing

9.9.6.2.1 Trip-Zone Input Timing Requirements

		MIN ⁽¹⁾	MAX	UNIT
$t_{w(\text{TZ})}$	Pulse duration, $\overline{\text{TZ}}\text{x}$ input low			
	Asynchronous	$2t_{c(\text{TBCLK})}$		cycles
	Synchronous	$2t_{c(\text{TBCLK})}$		cycles
	With input qualifier	$2t_{c(\text{TBCLK})} + t_{w(\text{IQSW})}$		cycles

(1) For an explanation of the input qualifier parameters, see Section 9.9.10.1.2.1.

A. $\overline{\text{TZ}}$ - $\overline{\text{TZ}}1$, $\overline{\text{TZ}}2$, $\overline{\text{TZ}}3$

B. PWM refers to all the PWM pins in the device. The state of the PWM pins after $\overline{\text{TZ}}$ is taken high depends on the PWM recovery software.

Figure 9-37. PWM Hi-Z Characteristics

9.9.7 High-Resolution PWM (HRPWM)

This module combines multiple delay lines in a single module and a simplified calibration system by using a dedicated calibration delay line. For each ePWM module there is one HR delay line.

The HRPWM module offers PWM resolution (time granularity) that is significantly better than what can be achieved using conventionally derived digital PWM methods. The key points for the HRPWM module are:

- Significantly extends the time resolution capabilities of conventionally derived digital PWM
- This capability can be used in both single edge (duty cycle and phase-shift control) as well as dual edge control for frequency/period modulation.
- Finer time granularity control or edge positioning is controlled through extensions to the Compare A and Phase registers of the ePWM module.
- HRPWM capabilities, when available on a particular device, are offered only on the A signal path of an ePWM module (that is, on the EPWMxA output). EPWMxB output has conventional PWM capabilities.

Note

The minimum SYSCLKOUT frequency allowed for HRPWM is 50 MHz.

Note

When dual-edge high-resolution is enabled (high-resolution period mode), the PWMxB output is not available for use.

9.9.7.1 HRPWM Electrical Data/Timing

Section 9.9.7.1.1 shows the high-resolution PWM switching characteristics.

9.9.7.1.1 High-Resolution PWM Characteristics at SYSCLKOUT = 50 MHz–60 MHz

PARAMETER ⁽¹⁾	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size ⁽²⁾		150	310	ps

- (1) The HRPWM operates at a minimum SYSCLKOUT frequency of 50 MHz. Below 50 MHz, with device process variation, the MEP step size may decrease under cold temperature and high core voltage conditions to such a point that 255 MEP steps will not span an entire SYSCLKOUT cycle.
- (2) The MEP step size will be largest at high temperature and minimum voltage on V_{DD}. MEP step size will increase with higher temperature and lower voltage and decrease with lower temperature and higher voltage. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.

9.9.8 Enhanced Capture Module (eCAP1)

The device contains an enhanced capture (eCAP) module. Figure 9-38 shows a functional block diagram of a module.

Copyright © 2017, Texas Instruments Incorporated

Figure 9-38. eCAP Functional Block Diagram

The eCAP module is clocked at the SYSCLKOUT rate.

The clock enable bits (ECAP1 ENCLK) in the PCLKCR1 register turn off the eCAP module individually (for low-power operation). Upon reset, ECAP1ENCLK is set to low, indicating that the peripheral clock is off.

Table 9-28. eCAP Control and Status Registers

NAME	eCAP1	SIZE (x16)	EALLOW PROTECTED	DESCRIPTION
TSCTR	0x6A00	2		Time-Stamp Counter

Reserved	0x6A1A to 0x6A1F	6		Reserved

For more information on the eCAP, see the Enhanced Capture (eCAP) Module chapter in the [TMS320F2802x, TMS320F2802xx Technical Reference Manual](#).

9.9.8.1 eCAP Electrical Data/Timing

[Section 9.9.8.1.1](#) shows the eCAP timing requirement and [Section 9.9.8.1.2](#) shows the eCAP switching characteristics.

9.9.8.1.1 Enhanced Capture (eCAP) Timing Requirement

		MIN ⁽¹⁾	MAX	UNIT
$t_{w(CAP)}$	Capture input pulse width	Asynchronous	$2t_{c(SCO)}$	cycles
		Synchronous	$2t_{c(SCO)}$	cycles
		With input qualifier	$1t_{c(SCO)} + t_{w(IQSW)}$	cycles

(1) For an explanation of the input qualifier parameters, see [Section 9.9.10.1.2.1](#).

9.9.8.1.2 eCAP Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(APWM)}$	Pulse duration, APWMx output high/low	20		ns

9.9.9 JTAG Port

On the 2802x device, the JTAG port is reduced to 5 pins ($\overline{\text{TRST}}$, TCK, TDI, TMS, TDO). TCK, TDI, TMS and TDO pins are also GPIO pins. The $\overline{\text{TRST}}$ signal selects either JTAG or GPIO operating mode for the pins in Figure 9-39. During emulation/debug, the GPIO function of these pins are not available. If the GPIO38/TCK/XCLKIN pin is used to provide an external clock, an alternate clock source should be used to clock the device during emulation/debug because this pin will be needed for the TCK function.

Note

In 2802x devices, the JTAG pins may also be used as GPIO pins. Care should be taken in the board design to ensure that the circuitry connected to these pins do not affect the emulation capabilities of the JTAG pin function. Any circuitry connected to these pins should not prevent the JTAG debug probe from driving (or being driven by) the JTAG pins for successful debug.

Figure 9-39. JTAG/GPIO Multiplexing

9.9.10 General-Purpose Input/Output (GPIO) MUX

The GPIO MUX can multiplex up to three independent peripheral signals on a single GPIO pin in addition to providing individual pin bit-banging I/O capability.

The device supports 22 GPIO pins. The GPIO control and data registers are mapped to Peripheral Frame 1 to enable 32-bit operations on the registers (along with 16-bit operations). [Table 9-29](#) shows the GPIO register mapping.

Table 9-29. GPIO Registers

NAME	ADDRESS	SIZE (x16)	DESCRIPTION
GPIO CONTROL REGISTERS (EALLOW PROTECTED)

(1) I = Input, O = Output

The user can select the type of input qualification for each GPIO pin through the GPxQSEL1/2 registers from four choices:

- Synchronization To SYSCLKOUT Only (GPxQSEL1/2 = 0, 0): This is the default mode of all GPIO pins at reset and it simply synchronizes the input signal to the system clock (SYSCLKOUT).
- Qualification Using Sampling Window (GPxQSEL1/2 = 0, 1 and 1, 0): In this mode the input signal, after synchronization to the system clock (SYSCLKOUT), is qualified by a specified number of cycles before the input is allowed to change.
- The sampling period is specified by the QUALPRD bits in the GPxCTRL register and is configurable in groups of 8 signals. It specifies a multiple of SYSCLKOUT cycles for sampling the input signal. The sampling window is either 3-samples or 6-samples wide and the output is only changed when ALL samples are the same (all 0s or all 1s) as shown in [Figure 9-42](#) (for 6 sample mode).
- No Synchronization (GPxQSEL1/2 = 1, 1): This mode is used for peripherals where synchronization is not required (synchronization is performed within the peripheral).

Due to the multilevel multiplexing that is required on the device, there may be cases where a peripheral input signal can be mapped to more than one GPIO pin. Also, when an input signal is not selected, the input signal will default to either a 0 or 1 state, depending on the peripheral.

- A. x stands for the port, either A or B. For example, GPxDIR refers to either the GPADIR and GPBDIR register depending on the particular GPIO pin selected.
- B. GPxDAT latch/read are accessed at the same memory location.
- C. This is a generic GPIO MUX block diagram. Not all options may be applicable for all GPIO pins. For pin-specific variations, see the System Control chapter in the *TMS320F2802x, TMS320F2802xx Technical Reference Manual*.

Figure 9-40. GPIO Multiplexing

9.9.10.1 GPIO Electrical Data/Timing

9.9.10.1.1 GPIO - Output Timing

9.9.10.1.1.1 General-Purpose Output Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER			MIN	MAX	UNIT
$t_{r(GPO)}$	Rise time, GPIO switching low to high	All GPIOs		13 ⁽¹⁾	ns
$t_{f(GPO)}$	Fall time, GPIO switching high to low	All GPIOs		13 ⁽¹⁾	ns
t_{GPO}	Toggle frequency			15	MHz

- (1) Rise time and fall time vary with electrical loading on I/O pins. Values given in Section 9.9.10.1.1 are applicable for a 40-pF load on I/O pins.

Figure 9-41. General-Purpose Output Timing

9.9.10.1.2 GPIO - Input Timing

9.9.10.1.2.1 General-Purpose Input Timing Requirements

			MIN	MAX	UNIT
$t_{w(SP)}$	Sampling period	QUALPRD = 0	$1t_{c(SCO)}$		cycles
		QUALPRD \neq 0	$2t_{c(SCO)} * QUALPRD$		cycles
$t_{w(IQSW)}$	Input qualifier sampling window		$t_{w(SP)} * (n^{(1)} - 1)$		cycles
$t_{w(GPI)}^{(2)}$	Pulse duration, GPIO low/high	Synchronous mode	$2t_{c(SCO)}$		cycles
		With input qualifier	$t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$		cycles

- (1) "n" represents the number of qualification samples as defined by GPxQSELn register.
- (2) For $t_{w(GPI)}$, pulse width is measured from V_{IL} to V_{IL} for an active low signal and V_{IH} to V_{IH} for an active high signal.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period in 2n SYSCLKOUT cycles (that is, at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected through the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Because external signals are driven asynchronously, an 13-SYSCLKOUT-wide pulse ensures reliable recognition.

Figure 9-42. Sampling Mode

9.9.10.1.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = $\text{SYSCLKOUT} / (2 \times \text{QUALPRD})$, if $\text{QUALPRD} \neq 0$

Sampling frequency = SYSCLKOUT , if $\text{QUALPRD} = 0$

Sampling period = $\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}$, if $\text{QUALPRD} \neq 0$

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle , if $\text{QUALPRD} = 0$

In a given sampling window, either 3 or 6 samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

Case 1:

Qualification using 3 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 2$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 2$, if $\text{QUALPRD} = 0$

Case 2:

Qualification using 6 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 5$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 5$, if $\text{QUALPRD} = 0$

Figure 9-43. General-Purpose Input Timing

Figure 9-44. Input Resistance Model for a GPIO Pin With an Internal Pullup

9.9.10.1.4 Low-Power Mode Wakeup Timing

Section 9.9.10.1.4.1 shows the timing requirements, Section 9.9.10.1.4.2 shows the switching characteristics, and Figure 9-45 shows the timing diagram for IDLE mode.

9.9.10.1.4.1 IDLE Mode Timing Requirements

		MIN ⁽¹⁾	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualifier	$2t_{c(SCO)}$	cycles
		With input qualifier	$5t_{c(SCO)} + t_{w(IQSW)}$	

(1) For an explanation of the input qualifier parameters, see Section 9.9.10.1.2.1.

9.9.10.1.4.2 IDLE Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER ⁽¹⁾		TEST CONDITIONS	MIN	MAX	UNIT
$t_d(WAKE-IDLE)$	Delay time, external wake signal to program execution resume ⁽²⁾				cycles
	• Wake up from Flash – Flash module in active state	Without input qualifier		$20t_{c(SCO)}$	cycles
		With input qualifier		$20t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake up from Flash – Flash module in sleep state	Without input qualifier		$1050t_{c(SCO)}$	cycles
		With input qualifier		$1050t_{c(SCO)} + t_{w(IQSW)}$	
	• Wake up from SARAM	Without input qualifier		$20t_{c(SCO)}$	cycles
With input qualifier			$20t_{c(SCO)} + t_{w(IQSW)}$		

(1) For an explanation of the input qualifier parameters, see Section 9.9.10.1.2.1.

(2) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. Execution of an ISR (triggered by the wake-up signal) involves additional latency.

A. WAKE INT can be any enabled interrupt, WDINT or XRS.

B. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 9-45. IDLE Entry and Exit Timing

9.9.10.1.4.3 STANDBY Mode Timing Requirements

			MIN	MAX	UNIT
$t_{w(WAKE-INT)}$	Pulse duration, external wake-up signal	Without input qualification	$3t_{c(OSCCLK)}$		cycles
		With input qualification ⁽¹⁾	$(2 + QUALSTDBY) * t_{c(OSCCLK)}$		

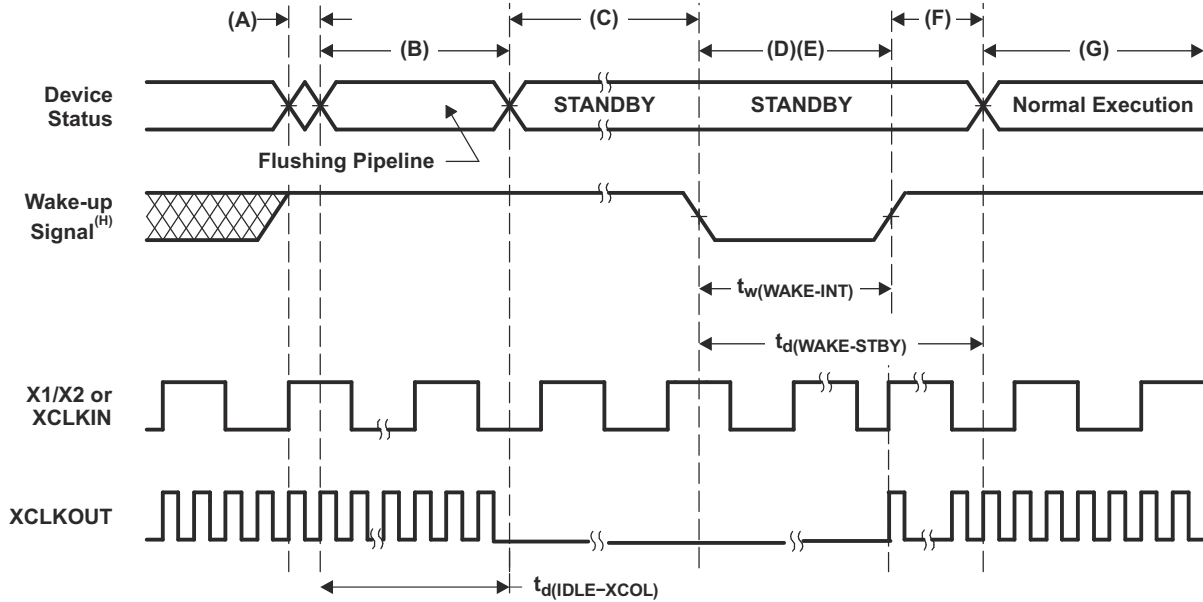

(1) QUALSTDBY is a 6-bit field in the LPMCR0 register.

9.9.10.1.4.4 STANDBY Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{d(IDLE-XCOL)}$	Delay time, IDLE instruction executed to XCLKOUT low	$32t_{c(SCO)}$	$45t_{c(SCO)}$	cycles
$t_{d(WAKE-STBY)}$	Delay time, external wake signal to program execution resume ⁽¹⁾			cycles
	• Wake up from flash – Flash module in active state	Without input qualifier	$100t_{c(SCO)}$	cycles
		With input qualifier	$100t_{c(SCO)} + t_{w(WAKE-INT)}$	
	• Wake up from flash – Flash module in sleep state	Without input qualifier	$1125t_{c(SCO)}$	cycles
		With input qualifier	$1125t_{c(SCO)} + t_{w(WAKE-INT)}$	
	• Wake up from SARAM	Without input qualifier	$100t_{c(SCO)}$	cycles
With input qualifier		$100t_{c(SCO)} + t_{w(WAKE-INT)}$		

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. Execution of an ISR (triggered by the wake-up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
 - B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for the number of cycles indicated below before being turned off:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
- This delay enables the CPU pipeline and any other pending operations to flush properly.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode.
 - D. The external wake-up signal is driven active.
 - E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
 - F. After a latency period, the STANDBY mode is exited.
 - G. Normal execution resumes. The device will respond to the interrupt (if enabled).
 - H. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 9-46. STANDBY Entry and Exit Timing Diagram

9.9.10.1.4.5 HALT Mode Timing Requirements

		MIN	MAX	UNIT
$t_w(\text{WAKE-GPIO})$	Pulse duration, GPIO wake-up signal	$t_{\text{oscst}} + 2t_c(\text{OSCCLK})$		cycles
$t_w(\text{WAKE-XRS})$	Pulse duration, $\overline{\text{XRS}}$ wake-up signal	$t_{\text{oscst}} + 8t_c(\text{OSCCLK})$		cycles

9.9.10.1.4.6 HALT Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
$t_d(\text{IDLE-XCOL})$	Delay time, IDLE instruction executed to XCLKOUT low	$32t_c(\text{SCO})$	$45t_c(\text{SCO})$	cycles
t_p	PLL lock-up time		1	ms
$t_d(\text{WAKE-HALT})$	Delay time, PLL lock to program execution resume			
	<ul style="list-style-type: none"> • Wake up from flash <ul style="list-style-type: none"> – Flash module in sleep state 		$1125t_c(\text{SCO})$	cycles
	<ul style="list-style-type: none"> • Wake up from SARAM 		$35t_c(\text{SCO})$	cycles

- A. IDLE instruction is executed to put the device into HALT mode.
- B. The PLL block responds to the HALT signal. SYSCLKOUT is held for the number of cycles indicated below before oscillator is turned off and the CLKIN to the core is stopped:
- 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11

This delay enables the CPU pipeline and any other pending operations to flush properly.

- C. Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power. It is possible to keep the zero-pin internal oscillators (INTOSC1 and INTOSC2) and the watchdog alive in HALT mode. This is done by writing to the appropriate bits in the CLKCTL register.
- D. When the GPIO n pin (used to bring the device out of HALT) is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Because the falling edge of the GPIO pin asynchronously begins the wake-up procedure, care should be taken to maintain a low noise environment prior to entering and during HALT mode.
- E. The wake-up signal fed to a GPIO pin to wake up the device must meet the minimum pulse width requirement. Furthermore, this signal must be free of glitches. If a noisy signal is fed to a GPIO pin, the wake-up behavior of the device will not be deterministic and the device may not exit low-power mode for subsequent wake-up pulses.
- F. Once the oscillator has stabilized, the PLL lock sequence is initiated, which takes 1 ms.
- G. When CLKIN to the core is enabled, the device will respond to the interrupt (if enabled), after a latency. The HALT mode is now exited.
- H. Normal operation resumes.
- I. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 9-47. HALT Mode Wakeup Using GPIO n

10 Applications, Implementation, and Layout

Note

Information in the following sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 TI Reference Design

The TI Reference Design Library is a robust reference design library spanning analog, embedded processor, and connectivity. Created by TI experts to help you jump start your system design, all reference designs include schematic or block diagrams, BOMs, and design files to speed your time to market. Search and download designs at the [Select TI reference designs](#) page.

[36V/1kW Brushless DC Motor Drive with Stall Current Limit of <1us Response Time Reference Design](#)

This reference design is a power stage for brushless motors in battery-powered garden and power tools rated up to 1 kW, operating from a 10-cell lithium-ion battery with a voltage range from 36 V to 42 V. The design uses 60-V, N-channel NexFET™ technology featuring a very low drain-to-source resistance (RDS_ON) of 1.8 mΩ in a SON5x6 SMD package, which results in a very small PCB form factor of 57 mm × 59 mm. The 3-phase gate-driver is used to drive a 3-phase MOSFET bridge, which can operate from 6 V to 60 V and supports programmable gate current with a maximum setting of 2.3-A sink/1.7-A source. The C2000 F28027 LaunchPad™ development kit ([LAUNCHXL-F28027](#)) is used with this power stage, and 120-degree trapezoidal control of BLDC motor with Hall sensors is implemented in software. The cycle-by-cycle current limit feature in the gate-driver protects the board from excessive current that is caused during motor stalls, by limiting the maximum current allowed in the power stage to a safe level.

[Single-Ended Signal Conditioning Circuit for Current and Voltage Measurement Using Fluxgate Sensors](#)

This design provides a 4-channel signal conditioning solution for single-ended SAR ADCs integrated into a microcontroller measuring motor current using fluxgate sensors. Also provided is an alternative measurement circuit with external SAR ADCs as well as circuits for high-speed overcurrent and earth fault detection. Proper signal conditioning improves noise immunity on critical current measurements in motor drives. This reference design can help increase the effective resolution of the analog-to-digital conversion, improving motor drive efficiency.

11 Device and Documentation Support

11.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ MCU devices and support tools. Each TMS320 MCU commercial family member has one of three prefixes: TMX, TMP, or TMS (for example, **TMS320F28023**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX	Experimental device that is not necessarily representative of the final device's electrical specifications
TMP	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
TMS	Fully qualified production device

Support tool development evolutionary flow:

TMDX	Development-support product that has not yet completed Texas Instruments internal qualification testing
TMDS	Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer: "Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PT) and temperature range (for example, S). [Figure 11-1](#) provides a legend for reading the complete device name for any family member.

For device part numbers and further ordering information, see the TI website (www.ti.com) or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the [TMS320F2802x, TMS320F2802xx MCUs Silicon Errata](#) .

A. For more information on peripheral, temperature, and package availability for a specific device, see [Table 6-1](#).

Figure 11-1. Device Nomenclature

11.2 Tools and Software

TI offers an extensive line of development tools. Some of the tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below. To view all available tools and software for C2000™ real-time control MCUs, visit the [C2000 real-time control MCUs – Design & development](#) page.

Development Tools

[Code Composer Studio \(CCS\) Integrated Development Environment \(IDE\) for C2000 Microcontrollers](#)

Code Composer Studio is an integrated development environment (IDE) that supports TI's Microcontroller and Embedded Processors portfolio. CCS comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. CCS combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

[C2000 F28027 LaunchPad™ development kit](#)

The C2000 F28027 LaunchPad™ development kit is an inexpensive, modular, and fun evaluation platform, enabling you to dive into real-time, closed-loop control development with Texas Instruments' C2000 32-bit microcontroller family. This platform provides a great starting point for development of many common power electronics applications, including motor control, digital power supplies, solar inverters, digital LED lighting, precision sensing, and more.

To view all available C2000 LaunchPad development kits and BoosterPack™ plug-in modules, visit the [Embedded development hardware kits & boards](#) site.

Software Tools

[powerSUITE - Digital Power Supply Design Software Tools for C2000™ MCUs](#)

powerSUITE is a suite of digital power supply design software tools for Texas Instruments' C2000 real-time microcontroller (MCU) family. powerSUITE helps power supply engineers drastically reduce development time as they design digitally-controlled power supplies based on C2000 real-time control MCUs.

[C2000Ware for C2000 MCUs](#)

C2000Ware for C2000™ microcontrollers is a cohesive set of development software and documentation designed to minimize software development time. From device-specific drivers and libraries to device peripheral examples, C2000Ware provides a solid foundation to begin development and evaluation of your product.

[UniFlash Standalone Flash Tool](#)

UniFlash is a standalone tool used to program on-chip flash memory through a GUI, command line, or scripting interface.

Models

Various models are available for download from the product Tools & Software pages. These include I/O Buffer Information Specification (IBIS) Models and Boundary-Scan Description Language (BSDL) Models. To view all available models, visit the Models section of the Tools & Software page for each device.

Training

To help assist design engineers in taking full advantage of the C2000 microcontroller features and performance, TI has developed a variety of training resources. Utilizing the online training materials and downloadable hands-on workshops provides an easy means for gaining a complete working knowledge of the C2000 microcontroller family. These training resources have been designed to decrease the learning curve, while reducing development time, and accelerating product time to market. For more information on the various training resources, visit the [C2000™ real-time control MCUs – Support & training](#) site.

Specific TMS320F2802x hands-on training resources can be found at [C2000™ MCU Device Workshops](#).

[InstaSPIN-FOC LaunchPad and BoosterPack](#)

This 6-part series provides information about the C2000 InstaSPIN-FOC Motor Control LaunchPad Development Kit and BoosterPack Plug-in Module.

The InstaSPIN-FOC enabled C2000 F28027 LaunchPad™ development kit is an inexpensive evaluation platform designed to help you leap right into the world of sensorless motor control using the InstaSPIN-FOC solution.

- [Part 1: Introduction and Overview](#)
- [Part 2: Identifying Your Motor](#)
- [Part 3: Zero Speed, Low Speed, & Tuning](#)
- [Part 4: Accelerations & Speed Reversals with Texas Instruments](#)
- [Part 5: High, Higher, Highest Speeds with Texas Instruments](#)
- [BOOSTXL-DRV8301 BoosterPack with Texas Instruments](#)

11.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the processor, related peripherals, and other technical collateral is listed below.

Errata

[TMS320F2802x, TMS320F2802xx MCUs Silicon Errata](#) describes known advisories on silicon and provides workarounds.

Technical Reference Manual

[TMS320F2802x, TMS320F2802xx Technical Reference Manual](#) details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

InstaSPIN Technical Reference Manuals

[InstaSPIN-FOC™ and InstaSPIN-MOTION™ User's Guide](#) describes the InstaSPIN-FOC and InstaSPIN-MOTION devices.

[TMS320F28026F, TMS320F28027F InstaSPIN™-FOC Software Technical Reference Manual](#) describes the TMS320F28026F and TMS320F28027F InstaSPIN-FOC software.

CPU User's Guides

[TMS320C28x CPU and Instruction Set Reference Guide](#) describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). This reference guide also describes emulation features available on these DSPs.

Peripheral Guides

[C2000 Real-Time Control Peripherals Reference Guide](#) describes the peripheral reference guides of the 28x digital signal processors (DSPs).

Tools Guides

[TMS320C28x Assembly Language Tools v20.2.0.LTS User's Guide](#) describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

[TMS320C28x Optimizing C/C++ Compiler v20.2.0.LTS User's Guide](#) describes the TMS320C28x C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

Application Reports

[Semiconductor Packing Methodology](#) describes the packing methodologies employed to prepare semiconductor devices for shipment to end users.

[Calculating Useful Lifetimes of Embedded Processors](#) provides a methodology for calculating the useful lifetime of TI embedded processors (EPs) under power when used in electronic systems. It is aimed at general engineers who wish to determine if the reliability of the TI EP meets the end system reliability requirement.

[Semiconductor and IC Package Thermal Metrics](#) describes traditional and new thermal metrics and puts their application in perspective with respect to system-level junction temperature estimation.

[Calculating FIT for a Mission Profile](#) explains how use TI's reliability de-rating tools to calculate a component level FIT under power on conditions for a system mission profile.

[Oscillator Compensation Guide](#) describes a factory supplied method for compensating the internal oscillators for frequency drift caused by temperature.

[An Introduction to IBIS \(I/O Buffer Information Specification\) Modeling](#) discusses various aspects of IBIS including its history, advantages, compatibility, model generation flow, data requirements in modeling the input/output structures and future trends.

[Serial Flash Programming of C2000™ Microcontrollers](#) discusses using a flash kernel and ROM loaders for serial programming a device.

11.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.5 Trademarks

InstaSPIN-FOC™, TMS320C2000™, NexFET™, LaunchPad™, TMS320™, BoosterPack™, InstaSPIN-MOTION™, and TI E2E™ are trademarks of Texas Instruments.

I2C-bus® is a registered trademark of NXP B.V. Corporation.

All trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

12.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DA (R-PDSO-G**)
 38 PIN SHOWN

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 D. Falls within JEDEC MO-153, except 30 pin body length.

DA (R-PDSO-G38)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - D. Contact the board fabrication site for recommended soldermask tolerances.

PT0048A

PACKAGE OUTLINE

LQFP - 1.6 mm max height

LOW PROFILE QUAD FLATPACK

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration MS-026.
4. This may also be a thermally enhanced plastic package with leads connected to the die pads.

EXAMPLE BOARD LAYOUT

LQFP - 1.6 mm max height

LOW PROFILE QUAD FLATPACK

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE 10.000

SOLDER MASK DETAILS

4215159/B 11/2023

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

PT0048A

LQFP - 1.6 mm max height

LOW PROFILE QUAD FLATPACK

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.
