

**THE DATASHEET OF  
ADV7127KR140**

## FEATURES

- 240 MSPS throughput rate
- 10-bit digital-to-analog converter (DAC)
- RS-343A-/RS-170-compatible output
- Complementary outputs
- DAC output current range: 2 mA to 18.5 mA
- TTL-compatible inputs
- Internal voltage reference
- Single supply 5 V or 3.3 V operation
- 24-lead thin shrink small outline package (TSSOP) package
- Low power dissipation
- Low power standby mode
- Power-down mode
- Industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ )

## APPLICATIONS

- Digital video systems ( $1600 \times 1200$  at 100 Hz)
- High resolution color graphics
- Digital radio modulation
- Image processing
- Instrumentation
- Video signal reconstruction
- Direct digital synthesis (DDS)
- Wireless local area networks (LANs)

## GENERAL DESCRIPTION

The **ADV7127** is a high speed, DAC on a single monolithic chip. It consists of a 10-bit, video DAC with an on-board voltage reference, complementary outputs, a standard TTL input interface, and high impedance analog output current sources.

The **ADV7127** has a 10-bit wide input port. A single 5 V or 3.3 V power supply and clock are all that are required to make the device functional.

The **ADV7127** is fabricated in a complementary metal-oxide semiconductor (CMOS) process. Its monolithic CMOS construction ensures greater functionality with low power dissipation. The **ADV7127** is available in a 24-lead TSSOP package which includes a power-down mode and an on-board voltage reference circuit.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

14989-001

## PRODUCT HIGHLIGHTS

1. 240 MSPS throughput.
2. Guaranteed monotonic to 10 bits.
3. Compatible with a wide variety of high resolution color graphics systems including RS-343A and RS-170.

ANALOG OUTPUTS						
Output Current		2.0		18.5	mA	
Output Compliance Range	$V_{OC}$	0		1.4	V	
Output Impedance	$R_{OUT}$		100		k $\Omega$	
Output Capacitance	$C_{OUT}$		10		pF	$I_{OUT} = 0 \text{ mA}$
Offset Error		-0.025		+0.025	% FSR	Tested with DAC output = 0 V
Gain Error <sup>2</sup>		-5.0		+5.0	% FSR	FSR = 17.62 mA
VOLTAGE REFERENCE (EXTERNAL AND INTERNAL) <sup>3</sup>						
Reference Range	$V_{REF}$	1.12	1.235	1.35	V	
POWER DISSIPATION						
Supply Current						
Digital						
			1.5	3	mA	$f_{CLK} = 50 \text{ MHz}$
			4	6	mA	$f_{CLK} = 140 \text{ MHz}$
			6.5	10	mA	$f_{CLK} = 240 \text{ MHz}$
Analog						
			23	27	mA	$R_{SET} = 560 \Omega$
			5		mA	$R_{SET} = 4933 \Omega$
Standby <sup>4</sup>						
			3.8	6	mA	PSAVE = low, digital and control inputs at $V_{AA}$
PDOWN						
			1		mA	
Power Supply Rejection Ratio	PSRR		0.1	0.5	%/%	

<sup>1</sup> Temperature range  $T_{MIN}$  to  $T_{MAX}$ :  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  at 50 MHz and 140 MHz, and  $0^\circ\text{C}$  to  $70^\circ\text{C}$  at 240 MHz.

<sup>2</sup> Gain error =  $((\text{Measured (FSC)}/\text{Ideal (FSC)} - 1) \times 100)$ , where  $\text{Ideal} = V_{REF}/R_{SET} \times K \times (0x3FF)$  and  $K = 7.9896$ .

<sup>3</sup> The digital supply is measured with a continuous clock, with data input corresponding to a ramp pattern, and with an input level at 0 V and  $V_{DD}$ .

<sup>4</sup> These typical/maximum specifications are guaranteed by characterization to be over the 4.75 V to 5.25 V range.

### 3.3 V ELECTRICAL CHARACTERISTICS

$V_{AA} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{REF} = 1.235\text{ V}$ ,  $R_{SET} = 560\ \Omega$ ,  $C_L = 10\text{ pF}$ . All specifications  $T_{MIN}$  to  $T_{MAX}$ ,<sup>1</sup> unless otherwise noted.  $T_{JMAX} = 110^\circ\text{C}$ .

Table 2.

Parameter <sup>2</sup>	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
STATIC PERFORMANCE						
Resolution (Each DAC)				10	Bits	$R_{SET} = 680\ \Omega$
Integral Nonlinearity (INL)		-1	+0.5	+1	LSB	
Differential Nonlinearity		-1	+0.25	+1	LSB	
DIGITAL AND CONTROL INPUTS

		2.85			ns	$f_{MAX} = 140\text{ MHz}$
		8.0			ns	$f_{MAX} = 50\text{ MHz}$
Low	$t_5$	1.875	1.25		ns	$f_{MAX} = 240\text{ MHz}$
		2.85			ns	$f_{MAX} = 140\text{ MHz}$
		8.0			ns	$f_{MAX} = 50\text{ MHz}$
Pipeline Delay <sup>6</sup>	$t_{PD}$	1.0	1.0	1.0	Clock cycles	Not shown in Figure 2
Up Time						
$\overline{PSAVE}$ <sup>6</sup>	$t_{10}$		2	10	ns	Not shown in Figure 2
$\overline{PDOWN}$	$t_{11}$		320		ns	Not shown in Figure 2

<sup>1</sup> Maximum and minimum specifications are guaranteed over this range in Table 3.

<sup>2</sup> Temperature range:  $T_{MIN}$  to  $T_{MAX}$ :  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  at 50 MHz and 140 MHz, and  $0^\circ\text{C}$  to  $70^\circ\text{C}$  at 240 MHz.

<sup>3</sup> Timing specifications are measured with input levels of 3.0 V ( $V_{IH}$ ) and 0 V ( $V_{IL}$ ) for both 5 V and 3.3 V supplies.

<sup>4</sup> Rise time was measured from the 10% to 90% point of zero to full-scale transition, and fall time from the 90% to 10% point of a full-scale transition.

<sup>5</sup> Measured from 50% point of full-scale transition to 2% of final value.

<sup>6</sup> Guaranteed by characterization.

<sup>7</sup>  $f_{CLK}$  maximum specification production tested at 125 MHz and 5 V. Limits specified in Table 3 are guaranteed by characterization.

3.3 V TIMING SPECIFICATIONS

$V_{AA} = 3.0\text{ V to }3.6\text{ V}$ ,<sup>1</sup>  $V_{REF} = 1.235\text{ V}$ ,  $R_{SET} = 560\ \Omega$ . All specifications  $T_{MIN}$  to  $T_{MAX}$ ,<sup>2</sup> unless otherwise noted.  $T_{JMAX} = 110^\circ\text{C}$ .

	$t_{10}$		4	10	ns	Not shown in Figure 2
<u>PDOWN</u>						
	$t_{11}$		320		ns	Not shown in Figure 2

<sup>1</sup> The values stated in Table 4 were obtained using  $V_{AA}$  in the range of 3.0 V to 3.6 V.

<sup>2</sup> Temperature range:  $T_{MIN}$  to  $T_{MAX}$ :  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  at 50 MHz and 140 MHz, and  $0^\circ\text{C}$  to  $70^\circ\text{C}$  at 240 MHz.

<sup>3</sup> Timing specifications are measured with input levels of 3.0 V ( $V_{IH}$ ) and 0 V ( $V_{IL}$ ) for both 5 V and 3.3 V supplies.

<sup>4</sup> Rise time was measured from the 10% to 90% point of zero to full-scale transition, and fall time from the 90% to 10% point of a full-scale transition.

<sup>5</sup> Measured from 50% point of full-scale transition to 2% of final value.

<sup>6</sup> Guaranteed by characterization.

<sup>7</sup>  $f_{CLK}$  maximum specification production tested at 125 MHz and 3.3 V. Limits specified in Table 4 are guaranteed by characterization.

NOTES

1. OUTPUT DELAY ( $t_6$ ) MEASURED FROM THE 50% POINT OF THE RISING EDGE OF CLOCK TO THE 50% POINT OF FULL-SCALE TRANSITION.
2. OUTPUT RISE/FALL TIME ( $t_7$ ) MEASURED BETWEEN THE 10% AND 90% POINTS OF FULL-SCALE TRANSITION.
3. TRANSITION TIME ( $t_8$ ) MEASURED FROM THE 50% POINT OF FULL-SCALE TRANSITION TO WITHIN 2% OF THE FINAL OUTPUT VALUE.

Figure 2. Timing Diagram

14959-002

## ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
$V_{AA}$ to GND	7 V
Voltage on Any Digital Pin	GND – 0.5 V to $V_{AA}$ + 0.5 V
Ambient Operating Temperature Range ( $T_A$ )	–40°C to +85°C
Storage Temperature Range ( $T_S$ )	–65°C to +150°C
Junction Temperature ( $T_J$ )	150°C
Lead Temperature (Soldering, 10 sec)	300°C
Vapor Phase Soldering (1 Minute)	220°C
$I_{OUT}$ to GND <sup>1</sup>	0 V to $V_{AA}$

<sup>1</sup> Analog output short circuit to any power supply or common can be of an indefinite duration.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration

Table 6. Pin Function Descriptions

Pin No.	Mnemonic	Description
1 to 9, 24	D0 to D9	Data Inputs (TTL-Compatible). Data is latched on the rising edge of CLOCK. D0 is the least significant data bit. Unused data inputs are connected to either the regular printed circuit board (PCB) power or ground plane. Data inputs are red, green, or blue pixel inputs.
10, 17	V <sub>AA</sub>	Analog Power Supply (5 V ± 5%). All V <sub>AA</sub> pins on the <a href="#">ADV7127</a> must be connected.
11	PDOWN	Power-Down Control Pin. The <a href="#">ADV7127</a> completely powers down, including the voltage reference circuit, when PDOWN is low.
12, 13	DNC	Do Not Connect. Do not connect to these pins.
14	CLOCK	Clock Input (TTL-Compatible). The rising edge of CLOCK latches D0 to D9 where D0 to D9 can be red, green, or blue pixel data inputs (TTL-compatible). CLOCK is typically the pixel clock rate of the video system. CLOCK is driven by a dedicated TTL buffer.
15, 16	GND	Ground. All GND pins must be connected.
18	I <sub>OUT</sub>	Differential Current Output. This pin is capable of directly driving a doubly terminated 75 Ω load. If not required, this output is tied to ground.
19	I <sub>OUT</sub>	Current Output. This high impedance current source is capable of directly driving a doubly terminated 75 Ω coaxial cable.
20	COMP	Compensation Pin. COMP is a compensation pin for the internal reference amplifier. A 0.1 μF ceramic capacitor must be connected between COMP and V <sub>AA</sub> .
21	V <sub>REF</sub>	Voltage Reference Input. An external 1.23 V voltage reference must be connected to this pin. The use of an external resistor divider network is not recommended. A 0.1 μF decoupling ceramic capacitor is connected between V <sub>REF</sub> and V <sub>AA</sub> .
22	R <sub>SET</sub>	Full-Scale Adjust Control. A resistor (R <sub>SET</sub> ) connected between this pin and GND controls the magnitude of the full-scale video signal. Note that the IRE relationships are maintained, regardless of the full-scale output current. The relationship between R <sub>SET</sub> and the full-scale output current on I <sub>OUT</sub> is given by I <sub>OUT</sub> (mA) = 7968 × V <sub>REF</sub> (V)/R <sub>SET</sub> (Ω).
23	PSAVE	Power Save Control Pin. The device is put into standby mode when PSAVE is low. The internal voltage reference circuit is still active.

# TYPICAL PERFORMANCE CHARACTERISTICS

## 5 V

$V_{AA} = 5\text{ V}$ ,  $V_{REF} = 1.235\text{ V}$ ,  $I_{OUT} = 17.62\ \mu\text{A}$ ,  $50\ \Omega$  doubly terminated load, differential output loading,  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

## TERMINOLOGY

### Color Video (RGB)

Color video (RGB) usually refers to the technique of combining the three primary colors of red, green, and blue to produce color pictures within the usual spectrum. In RGB monitors, three DACs are required, one for each color.

### Gray Scale

Gray scale is the discrete levels of video signal between the reference black and reference white levels. A 10-bit DAC contains 1024 different levels, whereas an 8-bit DAC contains 256.

### Raster Scan

Raster scan is the most basic method of sweeping a CRT one line at a time to generate and display images.

### Reference Black Level

Reference black level is the maximum negative polarity amplitude of the video signal.

### Reference White Level

Reference white level is the maximum positive polarity amplitude of the video signal.

### Video Signal

Video signal is the portion of the composite video signal that varies in gray scale levels between reference white and reference black. It is also referred to as the picture signal, which is the portion that can be visually observed.

## THEORY OF OPERATION

The **ADV7127** contains one 10-bit DAC, with one input channel containing a 10-bit register. A reference amplifier is also integrated on board the device.

### DIGITAL INPUTS

Ten bits of data (color information), D0 to D9, are latched into the device on the rising edge of each clock cycle. This data is presented to the 10-bit DAC and is then converted to an analog output waveform (see Figure 22).

Figure 22. Video Data Input/Output

All of these digital inputs are specified to accept TTL logic levels.

### CLOCK INPUT

The **CLOCK** input of the **ADV7127** is typically the pixel clock rate of the system. It is also known as the dot rate. The dot rate, and therefore the required **CLOCK** frequency, is determined by the onscreen resolution, according to the following equation:

$$\text{Dot Rate} = (\text{Horizontal Resolution} \times \text{Vertical Resolution} \times \text{Refresh Rate}) / \text{Retrace Factor}$$

where:

*Horizontal Resolution* is the number of pixels per line.

*Vertical Resolution* is the number of lines per frame.

*Refresh Rate* is the horizontal scan rate at which the screen must be refreshed, typically 60 Hz for a noninterlaced system or 30 Hz for an interlaced system.

*Retrace Factor* is the total blank time factor, which takes into account that the display is blanked for a certain fraction of the total duration of each frame (for example, 0.8).

If there is a graphics system with a 1024 × 1024 resolution, a noninterlaced 60 Hz refresh rate, and a retrace factor of 0.8, then

$$\text{Dot Rate} = (1024 \times 1024 \times 60) / 0.8 = 78.6 \text{ MHz}$$

The required **CLOCK** frequency is 78.6 MHz.

All video data and control inputs are latched into the **ADV7127** on the rising edge of **CLOCK**, as previously described in the Digital Inputs section. It is recommended that the **CLOCK** input to the **ADV7127** be driven by a TTL buffer (for example, 74F244).

Figure 23. IOUT RS-343A Video Output Waveform

Table 7. Video Output Truth Table ( $R_{SET} = 560 \Omega$ ,  $R_{LOAD} = 37.5 \Omega$ )

Description Data	$I_{OUT}$ (mA)	$V_{OUT}$ (V)	DAC Input
White Level	17.62	0	0x3FF
Video	Video	17.62 – Video	Data
Black Level	0	17.62	0x000

### REFERENCE INPUT

The **ADV7127** has an on-board voltage reference. The  $V_{REF}$  pin is normally terminated to  $V_{AA}$  through a 0.1  $\mu\text{F}$  capacitor. Alternatively, the device can, if required, be overdriven by an external 1.23 V reference (**AD1580**).

A resistance  $R_{SET}$  connected between the  $R_{SET}$  pin and the **GND** pin determines the amplitude of the output video level according to the following equation:

$$I_{OUT} \text{ (mA)} = (7968 \times V_{REF} \text{ (V)}) / R_{SET} \text{ (}\Omega\text{)}$$

Using a variable value of  $R_{SET}$  allows accurate adjustment of the analog output video levels. Use of a fixed 560  $\Omega$   $R_{SET}$  resistor yields the analog output levels quoted in Specifications section. These values typically correspond to the RS-343A video waveform values shown in Figure 23.

### DIGITAL-TO-ANALOG CONVERTER

The **ADV7127** contains a 10-bit DAC. The DAC is designed using an advanced, high speed, segmented architecture. The bit currents corresponding to each digital input are routed to either the analog output (bit = 1) or **GND** (bit = 0) by a sophisticated decoding scheme. The use of identical current sources in a monolithic design guarantees monotonicity and low glitch. The on-board operational amplifier stabilizes the full-scale output current against temperature and power supply variations.

### ANALOG OUTPUT

The analog output of the **ADV7127** is a high impedance current source. The current output is capable of directly driving a 37.5 Ω load, such as a doubly terminated 75 Ω coaxial cable. Figure 24 shows the required configuration for the output connected into a doubly terminated 75 Ω load. This arrangement develops RS-343A video output voltage levels across a 75 Ω monitor.

Figure 24. Analog Output Termination for RS-343A

A suggested method of driving RS-170 video levels into a 75 Ω monitor is shown in Figure 25. The output current level of the DAC remains unchanged, but the source termination resistance,  $Z_S$ , on the DAC is increased from 75 Ω to 150 Ω.

Figure 25. Analog Output Termination for RS-170

More detailed information regarding load terminations for various output configurations, including RS-343A and RS-170, is available in the [AN-205 Application Note, Video Formats and Required Load Terminations](#).

Figure 23 shows the video waveforms associated with the current output driving the doubly terminated 75 Ω load of Figure 24.

### GRAY SCALE OPERATION

The **ADV7127** can be used for standalone, gray scale (monochrome), or composite video applications (that is, only one channel used for video information).

### VIDEO OUTPUT BUFFER

The **ADV7127** is specified to drive transmission line loads, which is what most monitors are rated as. The analog output configurations to drive such loads are shown in Figure 26. However, in some applications, it may be required to drive long transmission line cable lengths. Cable lengths greater than 10 meters can attenuate and distort high frequency analog output pulses. The inclusion of the output buffers compensates for some cable distortion. Buffers with large full power bandwidths and gains between two and four are required. These buffers need to be able to supply sufficient current over the complete output voltage swing. Analog Devices, Inc., produces a range of suitable op amps for such applications. These include the [AD843/AD844/AD847](#) series of monolithic op amps. In very high frequency applications (80 MHz), the [AD8061](#) is recommended. More information on line driver buffering circuits is given in the relevant op amp data sheets.

Use of buffer amplifiers also allows implementation of other video standards besides RS-343A and RS-170. Altering the gain components of the buffer circuit results in any desired video level.

## PCB LAYOUT CONSIDERATIONS

The [ADV7127](#) is optimally designed for lowest noise performance, both radiated and conducted noise. To complement the excellent noise performance of the [ADV7127](#), it is imperative that great care be given to the PCB layout. Figure 27 shows a recommended connection diagram for the [ADV7127](#).

The PCB layout is optimized for lowest noise on the [ADV7127](#) power and ground lines. Radiated and conducted noise can be achieved by shielding the digital inputs and providing good decoupling. The lead length between groups of  $V_{AA}$  and GND pins is minimized to inductive ringing.

### GROUND PLANES

The [ADV7127](#) and associated analog circuitry have a separate ground plane referred to as the analog ground plane. This ground plane connects to the regular PCB ground plane at a single point through a ferrite bead, as illustrated in Figure 27. The ferrite bead is located as close as possible (within 3 inches) to the [ADV7127](#).

The analog ground plane encompasses all [ADV7127](#) ground pins, voltage reference circuitry, power supply bypass circuitry, the analog output traces, and any output amplifiers. The regular PCB ground plane area encompasses all the digital signal traces, excluding the ground pins, leading up to the [ADV7127](#).

### POWER PLANES

The PCB layout has two distinct power planes: one for analog circuitry and one for digital circuitry. The analog power plane encompasses the [ADV7127](#) ( $V_{AA}$ ) and all associated analog circuitry. This power plane is connected to the regular PCB power plane ( $V_{CC}$ ) at a single point through a ferrite bead, as illustrated in Figure 27. This bead is located within 3 inches of the [ADV7127](#).

The PCB power plane provides power to all digital logic on the PCB, and the analog power plane provides power to all [ADV7127](#) power pins, voltage reference circuitry, and any output amplifiers. The PCB power and ground planes do not overlay portions of the analog power plane. Keeping the PCB power and ground planes from overlaying the analog power plane contributes to a reduction in plane to plane noise coupling.

## SUPPLY DECOUPLING

Noise on the analog power plane can be further reduced by the use of multiple decoupling capacitors (see Figure 27).

Optimum performance is achieved by the use of 0.1  $\mu\text{F}$  ceramic capacitors. Each of the two groups of  $V_{AA}$  is individually decoupled to ground. The  $V_{AA}$  pins (Pin 10 and Pin 17) must be decoupled with capacitors to GND. Decouple the pins by placing the capacitors as close as possible to the device with the capacitor leads as short as possible between the  $V_{AA}$  and GND pins, thus minimizing lead inductance.

It is important to note that while the [ADV7127](#) contains circuitry to reject power supply noise, this rejection decreases with frequency. If a high frequency switching power supply is used, the designer must pay close attention to reducing power supply noise. A dc power supply filter (Murata BNX002) provides an electromagnetic interface (EMI) suppression between the switching power supply and the main PCB. Alternatively, consider using a 3-terminal voltage regulator.

## DIGITAL SIGNAL INTERCONNECT

The digital signal lines to the [ADV7127](#) must be isolated as much as possible from the analog outputs and other analog circuitry. Digital signal lines must not overlay the analog power plane.

Due to the high clock rates used, long clock lines to the [ADV7127](#) must be avoided to minimize noise pickup.

Any active pull-up termination resistors for the digital inputs are connected to the regular PCB power plane ( $V_{CC}$ ) and not the analog power plane.

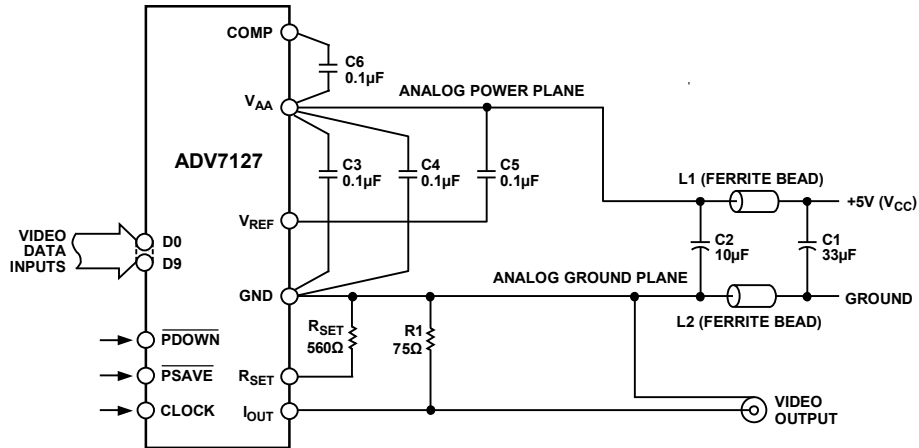

## ANALOG SIGNAL INTERCONNECT

The [ADV7127](#) is located as close as possible to the output connectors, which minimizes noise pickup and reflections due to impedance mismatch.

The video output signals overlay the ground plane and not the analog power plane, thereby maximizing the high frequency power supply rejection.

For optimum performance, the analog outputs each have a source termination resistance to ground of 75  $\Omega$  (doubly terminated 75  $\Omega$  configuration). This termination resistance must be as close as possible to the [ADV7127](#) to minimize reflections.

Additional information on PCB design is available in the [AN-333 Application Note, Design and Layout of a Video Graphics System for Reduced EMI](#).

COMPONENT	DESCRIPTION	VENDOR PART NUMBER
C1	33µF TANTALUM CAPACITOR	FAIR-RITE 274300111 OR MURATA BL01/02/03
