

# Low-Power, 12-Bit Voltage-Output DACs with Serial Interface

## General Description

The MAX5352/MAX5353 combine a low-power, voltage-output, 12-bit digital-to-analog converter (DAC) and a precision output amplifier in an 8-pin  $\mu$ MAX or DIP package. The MAX5352 operates from a single +5V supply, and the MAX5353 operates from a single +3.3V supply. Both devices draw less than 280 $\mu$ A of supply current.

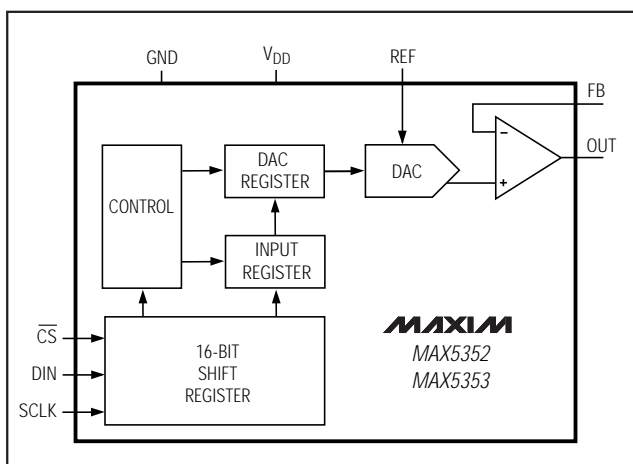

The output amplifier's inverting input is available to the user, allowing specific gain configurations, remote sensing, and high output current capability. This makes the MAX5352/MAX5353 ideal for a wide range of applications, including industrial process control. Other features include a software shutdown and power-on reset.

The serial interface is compatible with SPI™/QSPI™ and Microwire™. The DAC has a double-buffered input, organized as an input register followed by a DAC register. A 16-bit serial word loads data into the input register. The DAC register can be updated independently or simultaneously with the input register. All logic inputs are TTL/CMOS-logic compatible and buffered with Schmitt triggers to allow direct interfacing to optocouplers.

## Applications

- Industrial Process Controls
- Automatic Test Equipment
- Digital Offset and Gain Adjustment
- Motion Control
- Remote Industrial Controls
- Microprocessor-Controlled Systems

## Functional Diagram

SPI and QSPI are registered trademarks of Motorola, Inc. Microwire is a registered trademark of National Semiconductor Corp.

## Features

- ◆ **12-Bit DAC with Configurable Output Amplifier**
- ◆ **+5V Single-Supply Operation (MAX5352)**  
**+3.3V Single-Supply Operation (MAX5353)**
- ◆ **Low Supply Current: 0.28mA Normal Operation**  
**2 $\mu$ A Shutdown Mode**
- ◆ **Available in 8-Pin  $\mu$ MAX**
- ◆ **Power-On Reset Clears DAC Output to Zero**
- ◆ **SPI/QSPI and Microwire Compatible**
- ◆ **Schmitt-Trigger Digital Inputs for Direct Optocoupler Interface**
- ◆ **+3.3V MAX5353 Directly Interfaces with +5V Logic**

## Ordering Information

PART*	TEMP. RANGE	PIN-PACKAGE	INL (LSB)
MAX5352ACPA	0°C to +70°C	8 Plastic DIP	$\pm 1/2$
MAX5352BCPA	0°C to +70°C	8 Plastic DIP	$\pm 1$
MAX5352ACUA	0°C to +70°C	8 $\mu$ MAX	$\pm 1/2$
MAX5352BCUA	0°C to +70°C	8 $\mu$ MAX	$\pm 1$

**Ordering Information continued at end of data sheet.**

## Pin Configuration

# Low-Power, 12-Bit Voltage-Output DACs with Serial Interface

## ABSOLUTE MAXIMUM RATINGS

V <sub>DD</sub> to GND	-0.3V, +6V
REF, OUT, FB to GND	-0.3V to (V <sub>DD</sub> + 0.3V)
Digital Inputs to GND	-0.3V to +6V
Continuous Current into Any Pin	±20mA
Continuous Power Dissipation (T <sub>A</sub> = +70°C)	
Plastic DIP (derate 9.09mW/°C above +70°C)	727mW
μMAX (derate 4.10mW/°C above +70°C)	330mW
CERDIP (derate 8.00mW/°C above +70°C)	640mW

### Operating Temperature Ranges

MAX5352_C_A/MAX5353_C_A	0°C to +70°C
MAX5352_E_A/MAX5353_E_A	-40°C to +85°C
MAX5352BMJA/MAX5353BMJA	-55°C to +125°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS: MAX5352

(V<sub>DD</sub> = +5V ±10%, REF = 2.5V, GND = 0V, R<sub>L</sub> = 5kΩ, C<sub>L</sub> = 100pF, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C. Output buffer connected in unity-gain configuration (Figure 8).)

2	$\overline{\text{CS}}$	Chip-Select Input. Active low.
3	DIN	Serial-Data Input
4	SCLK	Serial-Clock Input
5	FB	DAC Output Amplifier Feedback
6	REF	Reference Voltage Input
7	GND	Ground
8	V <sub>DD</sub>	Positive Power Supply

## Detailed Description

The MAX5352/MAX5353 contain a voltage-output digital-to-analog converter (DAC) that is easily addressed using a simple 3-wire serial interface. Each IC includes a 16-bit shift register, and has a double-buffered input composed of an input register and a DAC register (see *Functional Diagram*). In addition to the voltage output, the amplifier's negative input is available to the user.

The DAC is an inverted R-2R ladder network that converts a digital input (12 data bits plus one sub-bit) into an equivalent analog output voltage in proportion to the applied reference voltage. Figure 1 shows a simplified circuit diagram of the DAC.

### Reference Inputs

The reference input accepts positive DC and AC signals. The voltage at the reference input sets the full-scale output voltage for the DAC. The reference input voltage range is 0V to (V<sub>DD</sub> - 1.4V). The output voltage (V<sub>OUT</sub>) is represented by a digitally programmable voltage source, as expressed in the following equation:

$$V_{\text{OUT}} = (V_{\text{REF}} \times \text{NB} / 4096) \times \text{Gain}$$

where NB is the numeric value of the DAC's binary input code (0 to 4095), V<sub>REF</sub> is the reference voltage, and Gain is the externally set voltage gain.

The impedance at the reference input is code dependent, ranging from a low value of 14k $\Omega$  when the DAC has an input code of 1554 hex, to a high value exceeding several giga ohms (leakage currents) with an input code of 0000 hex. Because the input impedance at the reference pin is code dependent, load regulation of the reference source is important.

Figure 1. Simplified DAC Circuit Diagram

In shutdown mode, the MAX5352/MAX5353's REF input enters a high-impedance state with a typical input leakage current of 0.001 $\mu$ A.

The reference input capacitance is also code dependent and typically ranges from 15pF (with an input code of all 0s) to 50pF (at full scale).

The MAX873 +2.5V reference is recommended for the MAX5352.

### Output Amplifier

The MAX5352/MAX5353's DAC output is internally buffered by a precision amplifier with a typical slew rate of 0.6V/ $\mu$ s. Access to the output amplifier's inverting input provides the user greater flexibility in output gain setting/signal conditioning (see the *Applications Information* section).

With a full-scale transition at the MAX5352/MAX5353 output, the typical settling time to  $\pm 1/2$ LSB is 14 $\mu$ s when loaded with 5k $\Omega$  in parallel with 100pF (loads less than 2k $\Omega$  degrade performance).

The amplifier's output dynamic responses and settling performances are shown in the *Typical Operating Characteristics*.

### Shutdown Mode

The MAX5352/MAX5353 feature a software-programmable shutdown that reduces supply current to a typical value of 4 $\mu$ A. Writing 111X XXXX XXXX as the input-control word puts the device in shutdown mode (Table 1).

In shutdown mode, the amplifier's output and the reference input enter a high-impedance state. The serial interface remains active. Data in the input registers is retained in shutdown, allowing the MAX5352/MAX5353

# Low-Power, 12-Bit Voltage-Output DACs with Serial Interface

to recall the output state prior to entering shutdown. Exit shutdown mode by either recalling the previous configuration or by updating the DAC with new data. When powering up the device or bringing it out of shutdown, allow 20µs for the output to stabilize.

### Serial-Interface Configurations

The MAX5352/MAX5353's 3-wire serial interface is compatible with both Microwire™ (Figure 2) and SPI™/QSPI™ (Figure 3). The serial input word consists of three control bits followed by 12+1 data bits (MSB first), as shown in Figure 4. The 3-bit control code determines the MAX5352/MAX5353's response outlined in Table 1.

The MAX5352/MAX5353's digital inputs are double buffered. Depending on the command issued through the serial interface, the input register can be loaded without affecting the DAC register, the DAC register can be loaded directly, or the DAC register can be updated from the input register (Table 1).

The +3.3V MAX5353 can also directly interface with +5V logic.

### Serial-Interface Description

The MAX5352/MAX5353 require 16 bits of serial data. Table 1 lists the serial-interface programming commands. For certain commands, the 12+1 data bits are "don't cares." Data is sent MSB first and can be sent in two 8-bit packets or one 16-bit word ( $\overline{CS}$  must remain low until 16 bits are transferred). The serial data is composed of three control bits (C2, C1, C0), followed by the 12+1 data bits D11...D0, S0 (Figure 4). Set the sub-bit (S0) to zero. The 3-bit control code determines:

- the register to be updated,
- the configuration when exiting shutdown.

Figure 5 shows the serial-interface timing requirements. The chip-select pin ( $\overline{CS}$ ) must be low to enable the DAC's serial interface. When  $\overline{CS}$  is high, the interface control circuitry is disabled.  $\overline{CS}$  must go low at least  $t_{CSS}$  before the rising serial clock (SCLK) edge to properly clock in the first bit. When  $\overline{CS}$  is low, data is clocked into the internal shift register via the serial-data input pin (DIN) on SCLK's rising edge. The maximum guaranteed clock frequency is 10MHz. Data is latched into the MAX5352/MAX5353 input/DAC register on  $\overline{CS}$ 's rising edge.

Figure 7. Multiple MAX5352/MAX5353s Sharing Common DIN and SCLK Lines

Figure 7 shows a method of connecting several MAX5352/MAX5353s. In this configuration, the clock and the data bus are common to all devices, and separate chip-select lines are used for each IC.

## Applications Information

### Unipolar Output

For a unipolar output, the output voltage and the reference input have the same polarity. Figure 8 shows the MAX5352/MAX5353 unipolar output circuit, which is also the typical operating circuit. Table 2 lists the unipolar output codes.

Figure 9 illustrates a rail-to-rail output. This circuit shows the MAX5352 with the output amplifier configured with a closed-loop gain of +2 to provide a 0V to 5V full-scale range when a 2.5V reference is used. When the MAX5353 is used with a 1.25V reference, this circuit provides a 0V to 2.5V full-scale range.

### Bipolar Output

The MAX5352/MAX5353 output can be configured for bipolar operation using Figure 10's circuit according to the following equation:

$$V_{OUT} = V_{REF} [(2NB / 4096) - 1]$$

where NB is the numeric value of the DAC's binary input code. Table 3 shows digital codes (offset binary) and the corresponding output voltage for Figure 10's circuit.

Table 2. Unipolar Code Table

DAC CONTENTS MSB	LSB	ANALOG OUTPUT
1111	1111 1111 (0)	$+V_{REF} \left( \frac{4095}{4096} \right)$
1000	0000 0001 (0)	$+V_{REF} \left( \frac{2049}{4096} \right)$
1000	0000 0000 (0)	$+V_{REF} \left( \frac{2048}{4096} \right) = \frac{+V_{REF}}{2}$
0111	1111 1111 (0)	$+V_{REF} \left( \frac{2047}{4096} \right)$
0000	0000 0001 (0)	$+V_{REF} \left( \frac{1}{4096} \right)$
0000	0000 0000 (0)	0V

NOTE: ( ) are for sub-bit.

### Using an AC Reference

In applications where the reference has AC-signal components, the MAX5352/MAX5353 have multiplying capability within the reference input range specifications. Figure 11 shows a technique for applying a sine-wave signal to the reference input where the AC signal is offset before being applied to REF. The reference voltage must never be more negative than GND.

# Low-Power, 12-Bit Voltage-Output DACs with Serial Interface

MAX5352/MAX5353

**Table 3. Bipolar Code Table**

DAC CONTENTS MSB	LSB	ANALOG OUTPUT
1111	1111 1111 (0)	$+V_{REF} \left( \frac{2047}{2048} \right)$
1000	0000 0001 (0)	$+V_{REF} \left( \frac{1}{2048} \right)$
1000	0000 0000 (0)	0V
0111	1111 1111 (0)	$-V_{REF} \left( \frac{1}{2048} \right)$
0000	0000 0001 (0)	$-V_{REF} \left( \frac{2047}{2048} \right)$
0000	0000 0000 (0)	$-V_{REF} \left( \frac{2048}{2048} \right) = -V_{REF}$

NOTE: ( ) are for sub-bit.

The MAX5352's total harmonic distortion plus noise (THD+N) is typically less than -77dB (full-scale code), and the MAX5353's THD+N is typically less than -72dB (full-scale code), given a 1Vp-p signal swing and input frequencies up to 25kHz. The typical -3dB frequency is 650kHz for both devices, as shown in the *Typical Operating Characteristics* graphs.

### Digitally Programmable Current Source

The circuit of Figure 12 places an NPN transistor (2N3904 or similar) within the op-amp feedback loop to implement a digitally programmable, unidirectional current source. The output current is calculated with the following equation:

$$I_{OUT} = (V_{REF}/R) \times (NB/4096)$$

where NB is the numeric value of the DAC's binary input code and R is the sense resistor shown in Figure 12.

Figure 11. AC Reference Input Circuit

Figure 12. Digitally Programmable Current Source

## Grounding and Layout Considerations

Digital or AC transient signals on GND can create noise at the analog output. Tie GND to the highest-quality ground available.

Good printed circuit board ground layout minimizes crosstalk between the DAC output, reference input, and digital input. Reduce crosstalk by keeping analog lines away from digital lines. Wire-wrapped boards are not recommended.

## Power-Supply Considerations

On power-up, the input and DAC registers are cleared (set to zero code).

For rated MAX5352/MAX5353 performance, REF must be at least 1.4V below VDD. Bypass VDD with a 4.7μF capacitor in parallel with a 0.1μF capacitor to GND. Use short lead lengths and place the bypass capacitors as close to the supply pins as possible.

MAX5353BCUA	0°C to +70°C	8 μMAX	±2
MAX5353AEPA	-40°C to +85°C	8 Plastic DIP	±1
MAX5353BEPA	-40°C to +85°C	8 Plastic DIP	±2
MAX5353AEUA	-40°C to +85°C	8 μMAX	±1
MAX5353BEUA	-40°C to +85°C	8 μMAX	±2
MAX5353BMJA	-55°C to +125°C	8 CERDIP**	±4

TRANSISTOR COUNT: 1677

\*Contact factory for availability of 8-pin SO package.  
 \*\*Contact factory for availability and processing to MIL-STD-883.

## Package Information

# Low-Power, 12-Bit Voltage-Output DACs with Serial Interface

## Package Information (continued)

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.

16 Maxim Integrated Products, 120 San Gabriel Drive, Sunnyvale, CA 94086 (408) 737-7600
