- NOTES:**
1. Zener Voltage ( $V_Z$ ) is measured with junction in thermal equilibrium with still air at a temperature of 25°C. The test currents ( $I_{ZT}$ ) at nominal voltages provide a constant 0.25 watts.
  2. The Zener impedance is derived when a 60 cycle ac current having an rms value equal to 10% of the dc Zener current ( $I_{ZT}$  or  $I_{ZK}$ ) is superimposed on  $I_{ZT}$  or  $I_{ZK}$ . Zener impedance is measured at 2 points to ensure a sharp knee on the breakdown curve and to eliminate unstable units. See [MicroNote 202](#) for variation in dynamic impedance with different Zener currents.
  3. These values of  $I_{ZM}$  may often be exceeded in the case of individual diodes. The values shown are calculated for a unit at the high voltage end of its tolerance range. Allowance has also been made for the rise in Zener voltage above  $V_{ZT}$  that results from Zener impedance and the increase in junction temperature as a unit approaches thermal equilibrium at a dissipation of 1 watt. The  $I_{ZM}$  values shown for +/- 5% tolerance units may be used with little error for +/-10% tolerance units, but should be reduced by 7% to include a +/- 20% tolerance unit near the high voltage end of its tolerance range.
