THE DATASHEET OF

ADC08038CIWMX

ADC08031/ADC08032/ADC08034/ADC08038 8-Bit High-Speed Serial I/O A/D Converters with Multiplexer Options, Voltage Reference, and Track/Hold Function

Check for Samples: ADC08031, ADC08032, ADC08034, ADC08038

FEATURES

- **Serial Digital Data Link Requires Few I/O Pins**
- **Analog Input Track/Hold Function**
- **2-, 4-, or 8-Channel Input Multiplexer Options with Address Logic**
- **0V to 5V Analog Input Range with Single 5V Power Supply**
- **No Zero or Full Scale Adjustment Required**
- **TTL/CMOS Input/Output Compatible**
- **On Chip 2.6V Band-Gap Reference**
- **0.3″ Standard Width 8-, 14-, or 20-Pin PDIP Package**
- **14-, 20-Pin Small-Outline Packages**

APPLICATIONS

- **Digitizing Automotive Sensors**
- **Process Control Monitoring**
- **Remote Sensing in Noisy Environments**
- **Instrumentation**
- **Test Systems**
- **Embedded Diagnostics**

KEY SPECIFICATIONS

- **Resolution: 8 bits**
- **Conversion time (f_C = 1 MHz): 8 µs (max)**
- **Power dissipation: 20 mW (max)**
- **Single supply: $5V_{DC}$ (±5%)**
- **Total unadjusted error: ±½ LSB and ±1LSB**
- **No missing codes over temperature**

DESCRIPTION

The ADC08031/ADC08032/ADC08034/ADC08038 are 8-bit successive approximation A/D converters with serial I/O and configurable input multiplexers with up to 8 channels. The serial I/O is configured to comply with the NSC MICROWIRE serial data exchange standard for easy interface to the COPS family of controllers, and can easily interface with standard shift registers or microprocessors.

The ADC08034 and ADC08038 provide a 2.6V band-gap derived reference. For devices offering specific voltage reference performance over temperature see ADC08131, ADC08134 and ADC08138.

A track/hold function allows th e analog voltage at the positive input to vary during the actual A/D conversion.

The analog inputs can be configured to operate in various combinations of single-ended, differential, or pseudo-differential modes. In addition, input voltage spans as small as 1V can be accommodated.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS(1)(2)(3)

Supply Voltage (V_{CC})			6.5V
Voltage at Inputs and Outputs			−0.3V to V_{CC} + 0.3V
Input Current at Any Pin(4)			±5 mA
Package Input Current(4)			±20 mA
Power Dissipation at $_A$ = 25°C(5)			800 mW
ESD Susceptibility(6)			1500V
Soldering Information	PDIP Package (10 sec.)		235°C
	SOIC Package:	Vapor Phase (60 sec.)	215°C
		Infrared (15 sec.)	220°C
Storage Temperature			−65°C to +150°C

(1) All voltages are measured with respect to AGND = DGND = 0 V_{DC}, unless otherwise specified.
(2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.
(3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
(4) When the input voltage V_{IN} at any pin exceeds the power supplies (V_{IN} < (AGND or DGND) or V_{IN} > V_{CC}) the current at that pin should be limited to 5 mA. The 20 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 5 mA to four pins.
(5) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA} and the ambient temperature, T_A. The maximum allowable power dissipation at any temperature is $P_D = (T_{JMAX} - T_A)/\theta_{JA}$ or the number given in the Absolute Maximum Ratings, whichever is lower. For these devices, T_{JMAX} = 125°C. The typical thermal resistances (θ_{JA}) of these parts when board mounted follow: ADC08031 and ADC08032 with BIN and CIN suffixes 120°C/W, ADC08038 with CIN suffix 80°C/W. ADC08031 with CIWM suffix 140°C/W, ADC08032 140°C/W, ADC08034 140°C/W, ADC08038 with CIWM suffix 91°C/W.
(6) Human body model, 100 pF capacitor discharged through a 1.5 kΩ resistor.

OPERATING RATINGS(1)(2)

Temperature Range ($T_{MIN} \le T_A \le T_{MAX}$) ADC08031BIN, ADC08031CIN, ADC08032BIN, ADC08032CIN, ADC08034BIN, ADC08034CIN, ADC08038BIN, ADC08038CIN, ADC08031BIWM, ADC08032BIWM, ADC08034BIWM, ADC08038BIWM, ADC08031CIWM, ADC08032CIWM, ADC08034CIWM, ADC08038CIWM	−40°C ≤ T_A ≤ +85°C
Supply Voltage (V_{CC})	4.5 V_{DC} to 6.3 V_{DC}

(1) Operating Ratings indicate conditions for which the device is functional. These ratings do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
(2) All voltages are measured with respect to AGND = DGND = 0 V_{DC}, unless otherwise specified.

ELECTRICAL CHARACTERISTICS

The following specifications apply for $V_{CC} = V_{REF} = +5\ V_{DC}$, and $f_{CLK} = 1$ MHz unless otherwise specified. **Boldface limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX};** all other limits $T_A = T_J = 25°C$.

I_{OUT}	TRI-STATE Output Current	V_{OUT} = 0V		**−3.0**	µA (max)
		V_{OUT} = 5V		**3.0**	µA (max)

(1) Typical figures are at $T_J = 25°C$ and represent the most likely parametric norm.
(2) Specified to AOQL (Average Outgoing Quality Level).
(3) Total unadjusted error includes offset, full-scale, linearity, multiplexer.
(4) Cannot be tested for the ADC08032.
(5) For $V_{IN(-)} \geq V_{IN(+)}$ the digital code will be 0000 0000. Two on-chip diodes are tied to each analog input (see Block Diagram) which will forward-conduct for analog input voltages one diode drop below ground or one diode drop greater than V_{CC} supply. During testing at low V_{CC} levels (e.g., 4.5V), high level analog inputs (e.g., 5V) can cause an input diode to conduct, especially at elevated temperatures, which will cause errors for analog inputs near full-scale. The spec allows 50 mV forward bias of either diode; this means that as long as the analog V_{IN} does not exceed the supply voltage by more than 50 mV, the output code will be correct. Exceeding this range on an unselected channel will corrupt the reading of a selected channel. Achievement of an absolute 0 V_{DC} to 5 V_{DC} input voltage range will therefore require a minimum supply voltage of 4.950 V_{DC} over temperature variations, initial tolerance and loading.
(6) Channel leakage current is measured after a single-ended channel is selected and the clock is turned off. For off channel leakage current the following two cases are considered: one, with the selected channel tied high (5 V_{DC}) and the remaining seven off channels tied low (0 V_{DC}), total current flow through the off channels is measured; two, with the selected channel tied low and the off channels tied high, total current flow through the off channels is again measured. The two cases considered for determining on channel leakage current are the same except total current flow through the selected channel is measured.

ELECTRICAL CHARACTERISTICS (continued)

The following specifications apply for $V_{CC} = V_{REF} = +5\ V_{DC}$, and $f_{CLK} = 1$ MHz unless otherwise specified. **Boldface limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX};** all other limits $T_A = T_J = 25°C$.

Symbol	Parameter	Conditions	Typical(1)	Limits(2)	Units (Limits)
I_{SOURCE}	Output Source Current	$V_{OUT} = 0V$		**−6.5**	mA (min)
I_{SINK}	Output Sink Current	$V_{OUT} = V_{CC}$		**8.0**	mA (min)
I_{CC}	Supply Current				
	ADC08031, ADC08034,	$\overline{CS}$ = HIGH			mA (max)
	and ADC08038			**3.0**	
	ADC08032(7)			**7.0**	mA (max)
REFERENCE CHARACTERISTICS					
$V_{REF}OUT$	Nominal Reference Output	$V_{REF}OUT$ Option Available Only on ADC08034 and ADC08038	2.6		V

(7) For the ADC08032 $V_{REF}IN$ is internally tied to V_{CC}, therefore, for the ADC08032 reference current is included in the supply current.

ELECTRICAL CHARACTERISTICS

The following specifications apply for $V_{CC} = V_{REF} = +5\ V_{DC}$, and $t_r = t_f = 20$ ns unless otherwise specified. **Boldface limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX};** all other limits $T_A = T_J = 25°C$.

Symbol	Parameter	Conditions	Typical(1)	Limits(2)	Units (Limits)
f_{CLK}	Clock Frequency		10		kHz (min)
				1	MHz (max)
	Clock Duty Cycle			**40**	% (min)
	See(3)			**60**	% (max)
T_C	Conversion Time (Not Including	$f_{CLK} = 1$ MHz		**8**	$1/f_{CLK}$ (max)
	MUX Addressing Time)			**8**	µs (max)
t_{CA}	Acquisition Time			**½**	$1/f_{CLK}$(max)
t_{SELECT}	CLK High while $\overline{CS}$ is High		50		ns
t_{SET-UP}	$\overline{CS}$ Falling Edge or Data Input			**25**	ns (min)
	Valid to CLK Rising Edge				
t_{HOLD}	Data Input Valid after CLK			**20**	ns (min)
	Rising Edge				
t_{pd1}, t_{pd0}	CLK Falling Edge to Output	$C_L = 100$ pF:			
	Data Valid(4)	Data MSB First		**250**	ns (max)
		Data LSB First		**200**	ns (max)
t_{1H}, t_{0H}	TRI-STATE Delay from Rising Edge	$C_L = 10$ pF, $R_L = 10$ kΩ	50		ns
	of $\overline{CS}$ to Data Output and SARS Hi-Z	(see TRI-STATE Test Circuits)			
		$C_L = 100$ pF, $R_L = 2$ kΩ		**180**	ns (max)
C_{IN}	Capacitance of Logic Inputs		5		pF
C_{OUT}	Capacitance of Logic Outputs		5		pF

(1) Typical figures are at $T_J = 25°C$ and represent the most likely parametric norm.
(2) Specified to AOQL (Average Outgoing Quality Level).
(3) A 40% to 60% duty cycle range insures proper operation at all clock frequencies. In the case that an available clock has a duty cycle outside of these limits the minimum time the clock is high or low must be at least 450 ns. The maximum time the clock can be high or low is 100 µs.
(4) Since data, MSB first, is the output of the comparator used in the successive approximation loop, an additional delay is built in (see Block Diagram) to allow for comparator response time.

*Some of these functions/pins are not available with other options.

For the ADC08034, the “SEL 1” Flip-Flop is bypassed, for the ADC08032, both “SEL 0” and “SEL 1” Flip-Flops are bypassed.

FUNCTIONAL DESCRIPTION

MULTIPLEXER ADDRESSING

The design of these converters utilizes a comparator structure with built-in sample-and-hold which provides for a differential analog input to be converted by a successive-approximation routine.

The actual voltage converted is always the difference between an assigned "+" input terminal and a "−" input terminal. The polarity of each input terminal of the pair indicates which line the converter expects to be the most positive. If the assigned "+" input voltage is less than the "−" input voltage the converter responds with an all zeros output code.

A unique input multiplexing scheme has been utilized to provide multiple analog channels with software-configurable single-ended, differential, or pseudo-differential (which will convert the difference between the voltage at any analog input and a common terminal) operation. The analog signal conditioning required in transducer-based data acquisition systems is significantly simplified with this type of input flexibility. One converter package can now handle ground referenced inputs and true differential inputs as well as signals with some arbitrary reference voltage.

A particular input configuration is assigned during the MUX addressing sequence, prior to the start of a conversion. The MUX address selects which of the analog inputs are to be enabled and whether this input is single-ended or differential. Differential inputs are restricted to adjacent channel pairs. For example, channel 0 and channel 1 may be selected as a differential pair but channel 0 or 1 cannot act differentially with any other channel. In addition to selecting differential mode the polarity may also be selected. Channel 0 may be selected as the positive input and channel 1 as the negative input or vice versa. This programmability is best illustrated by the MUX addressing codes shown in the following tables for the various product options.

The MUX address is shifted into the converter via the DI line. Because the ADC08031 contains only one differential input channel with a fixed polarity assignment, it does not require addressing.

The common input line (COM) on the ADC08038 can be used as a pseudo-differential input. In this mode the voltage on this pin is treated as the "−" input for any of the other input channels. This voltage does not have to be analog ground; it can be any reference potential which is common to all of the inputs. This feature is most useful in single-supply applications where the analog circuity may be biased up to a potential other than ground and the output signals are all referred to this potential.

Table 1. Multiplexer/Package Options

Part Number	Number of Analog Channels		Number of Package Pins
	Single-Ended	Differential	
ADC08031	1	1	8
ADC08032	2	1	8
ADC08034	4	2	14
ADC08038	8	4	20

1	0	0	+	−
1	0	1	−	+

Since the input configuration is under software control, it can be modified as required before each conversion. A channel can be treated as a single-ended, ground referenced input for one conversion; then it can be reconfigured as part of a differential channel for another conversion. Figure 19 illustrates the input flexibility which can be achieved.

The analog input voltages for each channel can range from 50mV below ground to 50mV above V_{CC} (typically 5V) without degrading conversion accuracy.

THE DIGITAL INTERFACE

A most important characteristic of these converters is their serial data link with the controlling processor. Using a serial communication format offers two very significant system improvements; it allows many functions to be included in a small package and it can eliminate the transmission of low level analog signals by locating the converter right at the analog sensor; transmitting highly noise immune digital data back to the host processor.

To understand the operation of these converters it is best to refer to the Timing Diagrams and Functional Block Diagram and to follow a complete conversion sequence. For clarity a separate timing diagram is shown for each device.

1. A conversion is initiated by pulling the $\overline{CS}$ (chip select) line low. This line must be held low for the entire conversion. The converter is now waiting for a start bit and its MUX assignment word.
2. On each rising edge of the clock the status of the data in (DI) line is clocked into the MUX address shift register. The start bit is the first logic “1” that appears on this line (all leading zeros are ignored). Following the start bit the converter expects the next 2 to 4 bits to be the MUX assignment word.
3. When the start bit has been shifted into the start location of the MUX register, the input channel has been assigned and a conversion is about to begin. An interval of ½ clock period (where nothing happens) is automatically inserted to allow the selected MUX channel to settle. The SARS line goes high at this time to signal that a conversion is now in progress and the DI line is disabled (it no longer accepts data).
4. The data out (DO) line now comes out of TRI-STATE and provides a leading zero for this one clock period of MUX settling time.
5. During the conversion the output of the SAR comparator indicates whether the analog input is greater than (high) or less than (low) a series of successive voltages generated internally from a ratioed capacitor array (first 5 bits) and a resistor ladder (last 3 bits). After each comparison the comparator's output is shipped to the DO line on the falling edge of CLK. This data is the result of the conversion being shifted out (with the MSB first) and can be read by the processor immediately.
6. After 8 clock periods the conversion is completed. The SARS line returns low to indicate this ½ clock cycle later.
7. The stored data in the successive approximation register is loaded into an internal shift register. If the programmer prefers the data can be provided in an LSB first format [this makes use of the shift enable ($\overline{SE}$) control line]. On the ADC08038 the $\overline{SE}$ line is brought out and if held high the value of the LSB remains valid on the DO line. When $\overline{SE}$ is forced low the data is clocked out LSB first. On devices which do not include the $\overline{SE}$ control line, the data, LSB first, is automatically shifted out the DO line after the MSB first data stream. The DO line then goes low and stays low until $\overline{CS}$ is returned high. The ADC08031 is an exception in that its data is only output in MSB first format.
8. All internal registers are cleared when the $\overline{CS}$ line is high and the t_{SELECT} requirement is met. See Data Input Timing under Timing Diagrams. If another conversion is desired $\overline{CS}$ must make a high to low transition followed by address information.
   - The DI and DO lines can be tied together and controlled through a bidirectional processor I/O bit with one wire. This is possible because the DI input is only “looked-at” during the MUX addressing interval while the DO line is still in a high impedance state.

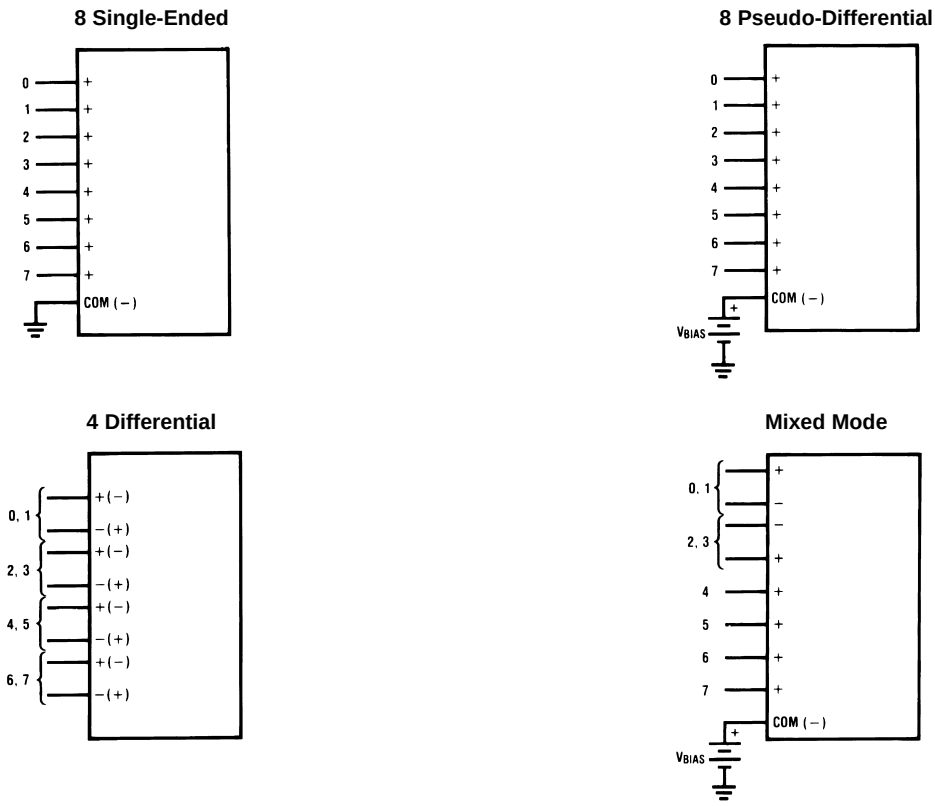

Figure 19. Analog Input Multiplexer Options for the ADC08038

REFERENCE CONSIDERATIONS

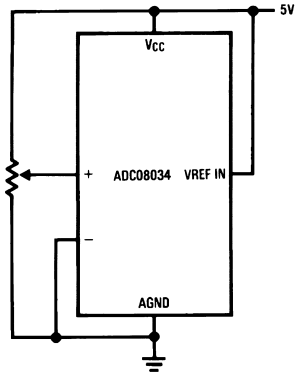
The voltage applied to the reference input on these converters, $V_{REF}IN$, defines the voltage span of the analog input (the difference between $V_{IN(MAX)}$ and $V_{IN(MIN)}$ over which the 256 possible output codes apply. The devices can be used either in ratiometric applications or in systems requiring absolute accuracy. The reference pin must be connected to a voltage source capable of driving the reference input resistance which can be as low as 1.3kΩ. This pin is the top of a resistor divider string and capacitor array used for the successive approximation conversion.

In a ratiometric system the analog input voltage is proportional to the voltage used for the A/D reference. This voltage is typically the system power supply, so the $V_{REF}IN$ pin can be tied to V_{CC} (done internally on the ADC08032). This technique relaxes the stability requirements of the system reference as the analog input and A/D reference move together maintaining the same output code for a given input condition.

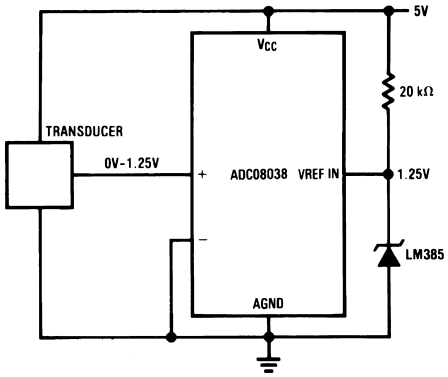
For absolute accuracy, where the analog input varies between very specific voltage limits, the reference pin can be biased with a time and temperature stable voltage source. For the ADC08034 and the ADC08038 a band-gap derived reference voltage of 2.6V (1) is tied to $V_{REF}OUT$. This can be tied back to $V_{REF}IN$. Bypassing $V_{REF}OUT$ with a 100µF capacitor is recommended. The LM385 and LM336 reference diodes are good low current devices to use with these converters.

The maximum value of the reference is limited to the V_{CC} supply voltage. The minimum value, however, can be quite small (see Typical Performance Characteristics) to allow direct conversions of transducer outputs providing less than a 5V output span. Particular care must be taken with regard to noise pickup, circuit layout and system error voltage sources when operating with a reduced span due to the increased sensitivity of the converter (1 LSB equals $V_{REF}/256$).

(1) Typical figures are at T_J = 25°C and represent the most likely parametric norm.



a) Ratiometric



b) Absolute with a Reduced Span

Figure 20. Reference Examples

THE ANALOG INPUTS

The most important feature of these converters is that they can be located right at the analog signal source and through just a few wires can communicate with a controlling processor with a highly noise immune serial bit stream. This in itself greatly minimizes circuitry to maintain analog signal accuracy which otherwise is most susceptible to noise pickup. However, a few words are in order with regard to the analog inputs should the input be noisy to begin with or possibly riding on a large common-mode voltage.

The differential input of these converters actually reduces the effects of common-mode input noise, a signal common to both selected "+" and "−" inputs for a conversion (60 Hz is most typical). The time interval between sampling the "+" input and then the "−" input is ½ of a clock period. The change in the common-mode voltage during this short time interval can cause conversion errors. For a sinusoidal common-mode signal this error is:

$$V_{error}(max) = V_{PEAK}(2\pi f_{CM}) \left(\frac{0.5}{f_{CLK}}\right) \quad (1)$$

where

- f_{CM} is the frequency of the common-mode signal,
- V_{PEAK} is its peak voltage value, and
- f_{CLK} is the A/D clock frequency.

For a 60Hz common-mode signal to generate a ¼ LSB error (≈5mV) with the converter running at 250kHz, its peak value would have to be 6.63V which would be larger than allowed as it exceeds the maximum analog input limits.

Source resistance limitation is important with regard to the DC leakage currents of the input multiplexer. Bypass capacitors should not be used if the source resistance is greater than 1kΩ. The worst-case leakage current of ±1µA over temperature will create a 1mV input error with a 1kΩ source resistance. An op amp RC active low pass filter can provide both impedance buffering and noise filtering should a high impedance signal source be required.

OPTIONAL ADJUSTMENTS

Zero Error

The zero of the A/D does not require adjustment. If the minimum analog input voltage value, $V_{IN(MIN)}$, is not ground a zero offset can be done. The converter can be made to output 0000 0000 digital code for this minimum input voltage by biasing any V_{IN} (−) input at this $V_{IN(MIN)}$ value. This utilizes the differential mode operation of the A/D.

The zero error of the A/D converter relates to the location of the first riser of the transfer function and can be measured by grounding the V_{IN} (−) input and applying a small magnitude positive voltage to the V_{IN} (+) input. Zero error is the difference between the actual DC input voltage which is necessary to just cause an output digital code transition from 0000 0000 to 0000 0001 and the ideal ½ LSB value (½ LSB = 9.8mV for V_{REF} = 5.000V_{DC}).

Full Scale

The full-scale adjustment can be made by applying a differential input voltage which is 1½ LSB down from the desired analog full-scale voltage range and then adjusting the magnitude of the V_{REF}IN input (or V_{CC} for the ADC08032) for a digital output code which is just changing from 1111 1110 to 1111 1111.

Adjusting for an Arbitrary Analog Input Voltage Range

If the analog zero voltage of the A/D is shifted away from ground (for example, to accommodate an analog input signal which does not go to ground), this new zero reference should be properly adjusted first. A V_{IN} (+) voltage which equals this desired zero reference plus ½ LSB (where the LSB is calculated for the desired analog span, using 1 LSB = analog span/256) is applied to selected "+" input and the zero reference voltage at the corresponding "−" input should then be adjusted to just obtain the 00_{HEX} to 01_{HEX} code transition.

The full-scale adjustment should be made [with the proper V_{IN} (−) voltage applied] by forcing a voltage to the V_{IN} (+) input which is given by:

$$V_{IN}(+)\ \text{fs adj} = V_{MAX} - 1.5\left[\frac{(V_{MAX} - V_{MIN})}{256}\right] \quad (2)$$

where

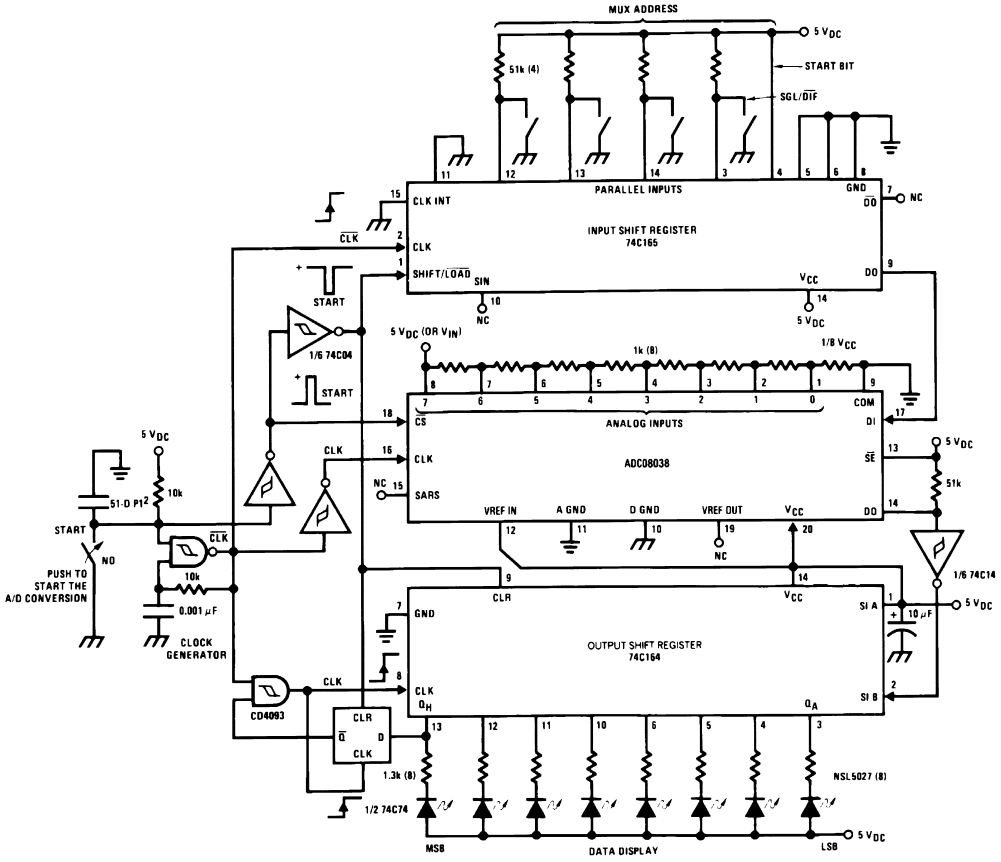
- V_{MAX} = the high end of the analog input range, and
- V_{MIN} = the low end (the offset zero) of the analog range.

(Both are ground referenced.)

The V_{REF}IN (or V_{CC}) voltage is then adjusted to provide a code change from FE_{HEX} to FF_{HEX}. This completes the adjustment procedure.

APPLICATIONS

Figure 21. A "Stand-Alone" Hook-Up for ADC08038 Evaluation



*Pinouts shown for ADC08038.
For all other products tie to pin functions as shown.

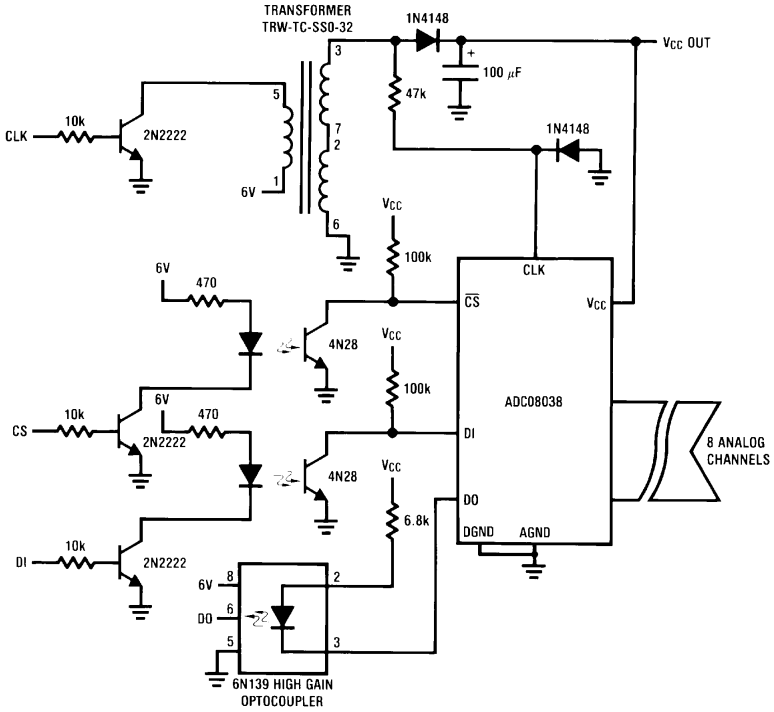
- 1500V isolation at output

Figure 31. Isolated Data Converter



- No power required remotely
- 1500V isolation

REVISION HISTORY

Changes from Revision B (April 2013) to Revision C	Page
• Changed layout of National Data Sheet to TI format	17

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
