

**THE DATASHEET OF
ADG5207BCPZ-RL7**

FEATURES

Latch-up proof

3.5 pF off source capacitance

Off drain capacitance

ADG5206: 64 pF

ADG5207: 33 pF

0.35 pC typical charge injection

±0.02 nA on channel leakage

Low on resistance: 155 Ω typical

±9 V to ±22 V dual-supply operation

9 V to 40 V single-supply operation

V_{SS} to V_{DD} analog signal range

Human body model (HBM) ESD rating

ADG5206: 8 kV all pins

ADG5207: 8 kV I/O port to supplies

APPLICATIONS

Automatic test equipment

Data acquisition

Instrumentation

Avionics

Battery monitoring

Communication systems

GENERAL DESCRIPTION

The **ADG5206** and **ADG5207** are monolithic CMOS analog multiplexers comprising 16 single channels and 8 differential channels, respectively. The **ADG5206** switches one of sixteen inputs to a common output, as determined by the 4-bit binary address lines, A0, A1, A2, and A3. The **ADG5207** switches one of eight differential inputs to a common differential output, as determined by the 3-bit binary address lines, A0, A1, and A2.

An EN input on both devices enables or disables the device. When EN is low, the device is disabled and all channels switch off. The ultralow capacitance and charge injection of these switches make them ideal solutions for data acquisition and sample-and-hold applications, where low glitch and fast settling are required. Fast switching speed coupled with high signal bandwidth make these devices suitable for video signal switching.

Each switch conducts equally well in both directions when on, and each switch has an input signal range that extends to the power supplies. In the off condition, signal levels up to the supplies are blocked.

Rev. A

FUNCTIONAL BLOCK DIAGRAMS

Figure 1.

Figure 2.

The **ADG5206/ADG5207** do not have V_L pins; instead, an on-chip voltage generator generates the logic power supply internally.

PRODUCT HIGHLIGHTS

1. Trench Isolation Guards Against Latch-Up. A dielectric trench separates the P and N channel transistors to prevent latch-up even under severe overvoltage conditions.
2. Optimal switch design for low charge injection, low switch capacitance, and low leakage currents.
3. The **ADG5206** achieves 8 kV HBM ESD specification on all external pins, while the **ADG5207** achieves 8 kV on the I/O port to supply pins, 2 kV on the I/O port to I/O port pins, and 8 kV on all other pins.
4. Dual-Supply Operation. For applications where the analog signal is bipolar, the **ADG5206/ADG5207** can be operated from dual supplies of up to ±22 V.
5. Single-Supply Operation. For applications where the analog signal is unipolar, the **ADG5206/ADG5207** can be operated from a single rail power supply of up to 40 V.

¹ The off channel leakage delta is calculated using the maximum of $V_S = +10\text{ V}$ and $V_D = -10\text{ V}$, or $V_S = -10\text{ V}$ and $V_D = +10\text{ V}$.

² The on channel leakage delta is calculated using the maximum of $V_S = V_D = +10\text{ V}$, or $V_S = V_D = -10\text{ V}$.

³ Guaranteed by design; not subject to production test.

±20 V DUAL SUPPLY

$V_{DD} = +20\text{ V} \pm 10\%$, $V_{SS} = -20\text{ V} \pm 10\%$, GND = 0 V, unless otherwise noted.

I/O Port to I/O Port	2 kV
All Other Pins	8 kV

¹ Overvoltages at the Ax, EN, Sx, D, and Dx pins are clamped by internal diodes. Limit current to the maximum ratings given.

² See Table 5 and Table 6.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating can be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

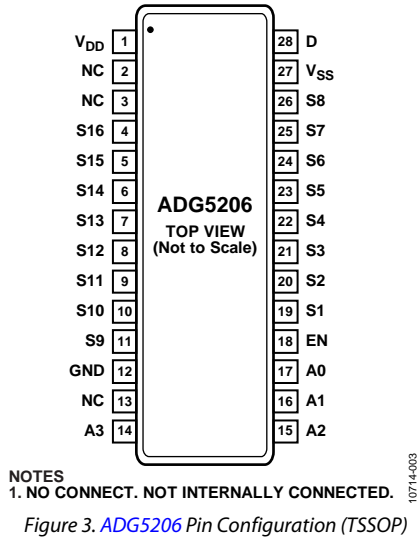

Figure 3. ADG5206 Pin Configuration (TSSOP)

Figure 4. ADG5206 Pin Configuration (LFCSP)

Table 8. ADG5206 Pin Function Descriptions

Pin No.		Mnemonic	Description
TSSOP	LFCSP		
1	31	V _{DD}	Most Positive Power Supply Potential.
2, 3, 13	12, 13, 26, 27, 28, 30, 32	NC	No Connect. Not internally connected.
4	1	S16	Source Terminal 16. This pin can be an input or an output.
5	2	S15	Source Terminal 15. This pin can be an input or an output.
6	3	S14	Source Terminal 14. This pin can be an input or an output.
7	4	S13	Source Terminal 13. This pin can be an input or an output.
8	5	S12	Source Terminal 12. This pin can be an input or an output.
9	6	S11	Source Terminal 11. This pin can be an input or an output.
10	7	S10	Source Terminal 10. This pin can be an input or an output.
11	8	S9	Source Terminal 9. This pin can be an input or an output.
12	9	GND	Ground (0 V) Reference.
14	10	A3	Logic Control Input.
15	11	A2	Logic Control Input.
16	14	A1	Logic Control Input.
17	15	A0	Logic Control Input.
18	16	EN	Active High Digital Input. When this pin is low, the device is disabled and all switches are turned off. When this pin is high, the Ax logic inputs determine which switch is turned on.
19	17	S1	Source Terminal 1. This pin can be an input or an output.
20	18	S2	Source Terminal 2. This pin can be an input or an output.
21	19	S3	Source Terminal 3. This pin can be an input or an output.
22	20	S4	Source Terminal 4. This pin can be an input or an output.
23	21	S5	Source Terminal 5. This pin can be an input or an output.
24	22	S6	Source Terminal 6. This pin can be an input or an output.
25	23	S7	Source Terminal 7. This pin can be an input or an output.
26	24	S8	Source Terminal 8. This pin can be an input or an output.
27	25	V _{SS}	Most Negative Power Supply Potential. In single-supply applications, this pin can be connected to ground.
28	29	D	Drain Terminal. This pin can be an input or an output.
NA	Exposed Pad		The exposed pad is connected internally. For increased reliability of the solder joints and maximum thermal capability, it is recommended that the pad be soldered to the substrate, V _{SS} .

TERMINOLOGY

I_{DD}

I_{DD} represents the positive supply current.

I_{SS}

I_{SS} represents the negative supply current.

V_D, V_S

V_D and V_S represent the analog voltage on Terminal D and Terminal S, respectively.

R_{ON}

R_{ON} is the ohmic resistance between Terminal D and Terminal S.

ΔR_{ON}

ΔR_{ON} represents the difference between the R_{ON} of any two channels.

$R_{FLAT(ON)}$

$R_{FLAT(ON)}$ is the flatness defined as the difference between the maximum and the minimum value of on resistance measured over the specified analog signal range.

I_S (Off)

I_S (Off) is the source leakage current with the switch off.

I_D (Off)

I_D (Off) is the drain leakage current with the switch off.

I_D (On), I_S (On)

I_D (On) and I_S (On) represent the channel leakage currents with the switch on.

V_{INL}

V_{INL} is the maximum input voltage for Logic 0.

V_{INH}

V_{INH} is the minimum input voltage for Logic 1.

I_{INL}, I_{INH}

I_{INL} and I_{INH} represent the low and high input currents of the digital inputs.

C_D (Off)

C_D (Off) represents the off switch drain capacitance, which is measured with reference to ground.

C_S (Off)

C_S (Off) represents the off switch source capacitance, which is measured with reference to ground.

C_D (On), C_S (On)

C_D (On) and C_S (On) represent on switch capacitances, which are measured with reference to ground.

C_{IN}

C_{IN} represents digital input capacitance.

$t_{ON(EN)}$

$t_{ON(EN)}$ represents the delay time between the 50% and 90% points of the digital input and switch on condition.

$t_{OFF(EN)}$

$t_{OFF(EN)}$ represents the delay time between the 50% and 90% points of the digital input and switch off condition.

$t_{TRANSITION}$

$t_{TRANSITION}$ represents the delay time between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

Break-Before-Make Time Delay (t_D)

t_D represents the off time measured between the 80% point of both switches when switching from one address state to another.

Off Isolation

Off isolation is a measure of unwanted signal coupling through an off channel.

Charge Injection

Charge injection is a measure of the glitch impulse transferred from the digital input to the analog output during switching.

Crosstalk

Crosstalk is a measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

Bandwidth

Bandwidth is the frequency at which the output is attenuated by 3 dB.

On Response

On response is the frequency response of the on switch.

AC Power Supply Rejection Ratio (ACPSRR)

ACPSRR is a measure of the ability of a device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p. The ratio of the amplitude of signal on the output to the amplitude of the modulation is the ACPSRR.

APPLICATIONS INFORMATION

The ADG52xx family of switches and multiplexers provides a robust solution for instrumentation, industrial, automotive, aerospace, and other harsh environments that are prone to latch-up, which is an undesirable high current state that can lead to device failure and persist until the power supply is turned off. The ADG5206/ADG5207 high voltage switches allow single-supply operation from 9 V to 40 V and dual-supply operation from ± 9 V to ± 22 V.

TRENCH ISOLATION

In the ADG5206/ADG5207, an insulating oxide layer (trench) is placed between the NMOS and the PMOS transistors of each CMOS switch. Parasitic junctions, which occur between the transistors in junction isolated switches, are eliminated, and the result is a completely latch-up proof switch.

In junction isolation, the N and P wells of the PMOS and NMOS transistors form a diode that is reverse-biased under normal operation. However, during overvoltage conditions, this diode can become forward-biased. A silicon controlled rectifier (SCR) type circuit is formed by the two transistors, causing a significant amplification of the current that, in turn, leads to latch-up. With trench isolation, this diode is removed and the result is a latch-up proof switch.
