GENERAL DESCRIPTION

The [ADM181x](#) range of voltage monitoring circuits is used in any application where an electronic system needs to be reset when a voltage increases above or below a predetermined value.

Because of the reset delay time incorporated into the [ADM181x](#) series, these devices provide a safe startup for electronic systems. Before a system initializes, the power supply must stabilize. Using the [ADM181x](#) series ensures that there are typically 150 ms for the power supply to stabilize before the system resets and safe system initialization begins.

The [ADM181x](#) series of microprocessor reset circuits are available in low cost, space-saving SOT-23 and SC70 packages.

This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

TIMING DIAGRAMS FOR ALL DEVICES

The following two timing diagrams are valid for [ADM1810](#), [ADM1811](#), [ADM1812](#), [ADM1813](#), [ADM1815](#), [ADM1816](#), [ADM1817](#), and [ADM1818](#).

Figure 9. Power-Down Timing Diagram

Figure 10. Power-Up Timing Diagram

ADM1813 AND ADM1818

The [ADM1813](#) and [ADM1818](#) are low cost voltage monitoring devices featuring an open-drain with internal pull-up resistor output and optional push-button reset function.

Figure 11. [ADM1813/ADM1818](#) Typical Application

An optional push-button reset switch can be connected between $\overline{\text{RST}}$ and ground. Pressing this switch pulls the reset output low. If the push-button reset button pulls the $\overline{\text{RST}}$ output low for a period greater than $1\ \mu\text{s}$ when the reset button releases the $\overline{\text{RST}}$ line to float high, then the $\overline{\text{RST}}$ line stays low for another 150 ms typical.

Figure 12. Push-Button Reset Timing Diagram

The [ADM1818](#) range has 2.88 V and 2.55 V (typical) trip point options that allow the user to monitor 3.3 V and 3 V supplies. For 5 V monitoring requirements, the [ADM1813](#) range has 4.62 V and 4.35 V (typical) trip point options.

ADM1810, ADM1812, ADM1815, AND ADM1817

The [ADM1812](#) is a 5 V supply monitor with an active high push-pull output and trip point options of 4.62 V and 4.35 V typical. The [ADM1810](#) is similar to the [ADM1812](#), except that the [ADM1810](#) has an active low push-pull output stage. The [ADM1817](#) is suitable for monitoring 3.3 V, 3 V, and 2.5 V supplies, with an active high push-pull output and trip point options of 3.06 V, 2.88 V, 2.55 V, 2.31 V, and 2.18 V typical. The [ADM1815](#) is similar to the [ADM1817](#), except that the [ADM1815](#) has an active low push-pull output stage.

The [ADM1810/ADM1812/ADM1815/ADM1817](#) can connect directly to most microprocessor reset inputs without the need for external components.

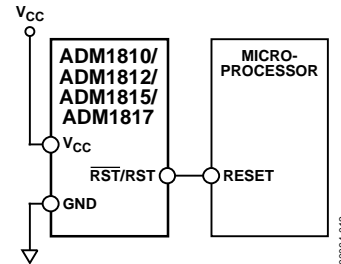

Figure 13. [ADM1810/ADM1812/ADM1815/ADM1817](#) Typical Application

ADM1811 AND ADM1816

The [ADM1811](#) is a 5 V supply monitor with an active low open-drain with internal pull-up resistor output and trip point options of 4.62 V and 4.35 V typical. The [ADM1816](#) also has an active low open-drain with internal pull-up resistor output but is suitable for monitoring lower voltage supplies of 3.3 V, 3 V, and 2.5 V.
