

THE DATASHEET OF AM1705DPTP4

AM1705 ARM® Microprocessor

1 Device Overview

1.1 Features

- 375- and 456-MHz ARM926EJ-S™ RISC Core
 - 32-Bit and 16-Bit (Thumb®) Instructions
 - Single-Cycle MAC
 - ARM Jazelle® Technology
 - Embedded ICE-RT™ for Real-Time Debug
- ARM9™ Memory Architecture
 - 16KB of Instruction Cache
 - 16KB of Data Cache
 - 8KB of RAM (Vector Table)
 - 64KB of ROM
- Enhanced Direct Memory Access Controller 3 (EDMA3):
 - 2 Transfer Controllers
 - 32 Independent DMA Channels
 - 8 Quick DMA Channels
 - Programmable Transfer Burst Size
- 128KB of RAM Memory
- 3.3-V LVCMOS I/Os (Except for USB Interface)
- Two External Memory Interfaces:
 - EMIFA
 - NOR (8-Bit-Wide Data)
 - NAND (8-Bit-Wide Data)
 - EMIFB
 - 16-Bit SDRAM With 128-MB Address Space
- Three Configurable 16550-Type UART Modules:
 - UART0 With Modem Control Signals
 - 16-Byte FIFO
 - 16x or 13x Oversampling Option
 - Autoflow Control Signals (CTS, RTS) on UART0 Only
- Two Serial Peripheral Interfaces (SPIs) Each With One Chip Select
- Programmable Real-Time Unit Subsystem (PRUSS)
 - Two Independent Programmable Real-Time Unit (PRU) Cores
 - 32-Bit Load-Store RISC Architecture
 - 4KB of Instruction RAM per Core
 - 512 Bytes of Data RAM per Core
 - PRUSS can be Disabled Through Software to Save Power
 - Standard Power-Management Mechanism
 - Clock Gating
 - Entire Subsystem Under a Single PSC Clock Gating Domain
 - Dedicated Interrupt Controller
 - Dedicated Switched Central Resource
- Multimedia Card (MMC)/Secure Digital (SD) Card Interface With Secure Data I/O (SDIO)
- Two Master and Slave Inter-Integrated Circuit (I²C Bus™)
- USB 2.0 OTG Port With Integrated PHY (USB0)
 - USB 2.0 Full-Speed Client
 - USB 2.0 Full- and Low-Speed Host
 - End Point 0 (Control)
 - End Points 1, 2, 3, and 4 (Control, Bulk, Interrupt, or ISOC) RX and TX
- Two Multichannel Audio Serial Ports (McASPs):
 - Six Clock Zones and 28 Serial Data Pins
 - Supports TDM, I2S, and Similar Formats
 - FIFO Buffers for Transmit and Receive
- 10/100 Mbps Ethernet MAC (EMAC):
 - IEEE 802.3 Compliant (3.3-V I/O Only)
 - RMI Media-Independent Interface
 - Management Data I/O (MDIO) Module
- One 64-Bit General-Purpose Timer (Configurable as Two 32-Bit Timers)
- One 64-Bit General-Purpose Watchdog Timer (Configurable as Two 32-Bit General-Purpose Timers)
- Three Enhanced Pulse Width Modulators (eHRPWMs):
 - Dedicated 16-Bit Time-Base Counter With Period and Frequency Control
 - 6 Single-Edge, 6 Dual-Edge Symmetric, or 3 Dual-Edge Asymmetric Outputs
 - Dead-Band Generation
 - PWM Chopping by High-Frequency Carrier
 - Trip Zone Input
- Three 32-Bit Enhanced Capture (eCAP) Modules:
 - Configurable as 3 Capture Inputs or 3 Auxiliary Pulse Width Modulator (APWM) Outputs
 - Single-Shot Capture of up to Four Event Timestamps
- Two 32-Bit Enhanced Quadrature Encoder Pulse (eQEP) Modules
- 176-Pin PowerPAD™ Plastic Quad Flat Pack [PTP suffix], 0.5-mm Pin Pitch
- Commercial, Industrial, or Extended Temperature

1.2 Applications

- Industrial Automation
- Home Automation
- Test and Measurement
- Portable Data Terminals

1.3 Description

The AM1705 is a low-power ARM microprocessor based on an ARM926EJ-S.

The device enables original-equipment manufacturers (OEMs) and original-design manufacturers (ODMs) to quickly bring to market devices with robust operating systems, rich user interfaces, and high processor performance through the maximum flexibility of a fully integrated, mixed processor solution.

The ARM926EJ-S is a 32-bit RISC processor core that performs 32-bit or 16-bit instructions and processes 32-, 16-, or 8-bit data. The core uses pipelining so that all parts of the processor and memory system can operate continuously.

The ARM core has a coprocessor 15 (CP15), protection module, and data and program memory management units (MMUs) with table look-aside buffers. The ARM core has separate 16KB of instruction and 16-KB data caches. Both memory blocks are 4-way associative with virtual index virtual tag (VIVT). The ARM core also has 8KB of RAM (Vector Table) and 64KB of ROM.

The peripheral set includes: a 10/100 Mbps Ethernet MAC (EMAC) with a management data input/output (MDIO) module; two I²C Bus interfaces; three multichannel audio serial ports (McASPs) with serializers and FIFO buffers; two 64-bit general-purpose timers each configurable (one configurable as watchdog); up to 8 banks of 16 pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; three UART interfaces (one with both \overline{RTS} and \overline{CTS}); three enhanced high-resolution pulse width modulator (eHRPWM) peripherals; three 32-bit enhanced capture (eCAP) module peripherals which can be configured as 3 capture inputs or 3 auxiliary pulse width modulator (APWM) outputs; two 32-bit enhanced quadrature encoded pulse (eQEP) peripherals; and 2 external memory interfaces: an asynchronous and SDRAM external memory interface (EMIFA) for slower memories or peripherals, and a higher speed memory interface (EMIFB) for SDRAM.

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the device and the network. The EMAC supports both 10Base-T and 100Base-TX, or 10 Mbps and 100 Mbps in either half- or full-duplex mode. Additionally, an MDIO interface is available for PHY configuration.

The I²C, SPI, and USB2.0 ports allow the device to easily control peripheral devices and/or communicate with host processors.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each peripheral, see the related sections later in this document and the associated peripheral reference guides.

The device has a complete set of development tools for the ARM processor. These tools include C compilers and a Windows® debugger interface for visibility into source code execution.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
AM1705	HLQFP (176)	24.00 mm x 24.00 mm

(1) For more information on these devices, see [Section 8](#).

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from June 15, 2014 to January 15, 2017	Page
<ul style="list-style-type: none"> • Updated/Changed the following registers to Reserved in Table 6-17: 0x6800 0018, 0x6800 001C, 0x6800 0078, 0x6800 007C..... • Updated/Changed Figure 6-13, Figure 6-14, Figure 6-15, and Figure 6-16..... 	61 64

3 Device Comparison

3.1 Device Characteristics

Table 3-1 provides an overview of the device. The table shows significant features of the device, including the capacity of on-chip RAM, peripherals, and the package type with pin count.

Table 3-1. Characteristics of the Device

HARDWARE FEATURES		AM1705
Peripherals	EMIFB	16-bit, up to 128 MB SDRAM
	EMIFA	Asynchronous (8-bit bus width) RAM, Flash, NOR, NAND
	Flash Card Interface	MMC and SD cards supported
	EDMA3	32 independent channels, 8 QDMA channels, 2 Transfer controllers
	Timers	2 64-Bit General Purpose (configurable as 2 separate 32-bit timers, 1 configurable as Watch Dog)
	UART	3 (one with RTS and CTS flow control)
	SPI	2 (Each with one hardware chip select)
	I ² C	2 (both Master/Slave)
	Multichannel Audio Serial Port [McASP]	2(each with transmit/receive, FIFO buffer, 16/12/4 serializers)
	10/100 Ethernet MAC with Management Data I/O	1 (RMII Interface)
Not all peripherals pins are available at the same time (for more detail, see the Device Configurations section).	eHRPWM	6 Single Edge, 6 Dual Edge Symmetric, or 3 Dual Edge Asymmetric Outputs
	eCAP	3 32-bit capture inputs or 3 32-bit auxiliary PWM outputs
	eQEP	2 32-bit QEP channels with 4 inputs/channel
	USB 2.0 (USB0)	Full-Speed/Low-Speed OTG Controller with on-chip OTG PHY
	General-Purpose Input/Output Port	8 banks of 16-bit
	PRU Subsystem (PRUSS)	2 Programmable PRU Cores
	Size (Bytes)	168KB RAM, 64KB ROM
On-Chip Memory	Organization	ARM 16KB I-Cache 16KB D-Cache 8KB RAM (Vector Table) 64KB ROM ADDITIONAL MEMORY 128KB RAM
	JTAG BSDL_ID	DEVIDR0 register 0x8B7D F02F (Silicon Revision 1.1) 0x9B7D F02F (Silicon Revisions 3.0, 2.1, and 2.0)
CPU Frequency	MHz	ARM926 375 MHz (1.2V) or 456 MHz (1.3V)
Voltage	Core (V)	1.2 V nominal for 375 MHz version 1.3 V nominal for 456 MHz version
	I/O (V)	3.3 V
Package		24 mm x 24 mm, 176-Pin, 0.5 mm pitch, TQFP (PTP)
Product Status ⁽¹⁾	Product Preview (PP), Advance Information (AI), or Production Data (PD)	375 MHz Versions - PD 456 MHz Version - PD

(1) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters..

3.2 Device Compatibility

The ARM926EJ-S RISC CPU is compatible with other ARM9 CPUs from ARM Holdings plc.

3.3 ARM Subsystem

The ARM Subsystem includes the following features:

- ARM926EJ-S RISC processor
- ARMv5TEJ (32/16-bit) instruction set
- Little endian
- System Control Co-Processor 15 (CP15)
- MMU
- 16KB Instruction cache
- 16KB Data cache
- Write Buffer
- Embedded Trace Module and Embedded Trace Buffer (ETM/ETB)
- ARM Interrupt controller

3.3.1 ARM926EJ-S RISC CPU

The ARM Subsystem integrates the ARM926EJ-S processor. The ARM926EJ-S processor is a member of ARM9 family of general-purpose microprocessors. This processor is targeted at multi-tasking applications where full memory management, high performance, low die size, and low power are all important. The ARM926EJ-S processor supports the 32-bit ARM and 16 bit THUMB instruction sets, enabling the user to trade off between high performance and high code density. Specifically, the ARM926EJ-S processor supports the ARMv5TEJ instruction set, which includes features for efficient execution of Java byte codes, providing Java performance similar to Just in Time (JIT) Java interpreter, but without associated code overhead.

The ARM926EJ-S processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug. The ARM926EJ-S processor has a Harvard architecture and provides a complete high performance subsystem, including:

- ARM926EJ -S integer core
- CP15 system control coprocessor
- Memory Management Unit (MMU)
- Separate instruction and data caches
- Write buffer
- Separate instruction and data (internal RAM) interfaces
- Separate instruction and data AHB bus interfaces
- Embedded Trace Module and Embedded Trace Buffer (ETM/ETB)

For more complete details on the ARM9, refer to the ARM926EJ-S Technical Reference Manual, available at <http://www.arm.com>

3.3.2 CP15

The ARM926EJ-S system control coprocessor (CP15) is used to configure and control instruction and data caches, Memory Management Unit (MMU), and other ARM subsystem functions. The CP15 registers are programmed using the MRC and MCR ARM instructions, when the ARM in a privileged mode such as supervisor or system mode.

3.3.3 MMU

A single set of two level page tables stored in main memory is used to control the address translation, permission checks and memory region attributes for both data and instruction accesses. The MMU uses a single unified Translation Lookaside Buffer (TLB) to cache the information held in the page tables. The MMU features are:

- Standard ARM architecture v4 and v5 MMU mapping sizes, domains and access protection scheme.
- Mapping sizes are:
 - 1MB (sections)
 - 64KB (large pages)
 - 4KB (small pages)
 - 1KB (tiny pages)
- Access permissions for large pages and small pages can be specified separately for each quarter of the page (subpage permissions)
- Hardware page table walks
- Invalidate entire TLB, using CP15 register 8
- Invalidate TLB entry, selected by MVA, using CP15 register 8
- Lockdown of TLB entries, using CP15 register 10

3.3.4 Caches and Write Buffer

The size of the Instruction cache is 16KB, Data cache is 16KB. Additionally, the caches have the following features:

- Virtual index, virtual tag, and addressed using the Modified Virtual Address (MVA)
- Four-way set associative, with a cache line length of eight words per line (32-bytes per line) and with two dirty bits in the Dcache
- Dcache supports write-through and write-back (or copy back) cache operation, selected by memory region using the C and B bits in the MMU translation tables
- Critical-word first cache refilling
- Cache lockdown registers enable control over which cache ways are used for allocation on a line fill, providing a mechanism for both lockdown, and controlling cache corruption
- Dcache stores the Physical Address TAG (PA TAG) corresponding to each Dcache entry in the TAG RAM for use during the cache line write-backs, in addition to the Virtual Address TAG stored in the TAG RAM. This means that the MMU is not involved in Dcache write-back operations, removing the possibility of TLB misses related to the write-back address.
- Cache maintenance operations provide efficient invalidation of, the entire Dcache or Icache, regions of the Dcache or Icache, and regions of virtual memory.

The write buffer is used for all writes to a noncachable bufferable region, write-through region and write misses to a write-back region. A separate buffer is incorporated in the Dcache for holding write-back for cache line evictions or cleaning of dirty cache lines. The main write buffer has 16-word data buffer and a four-address buffer. The Dcache write-back has eight data word entries and a single address entry.

3.3.5 Advanced High-Performance Bus (AHB)

The ARM Subsystem uses the AHB port of the ARM926EJ-S to connect the ARM to the Config bus and the external memories. Arbiters are employed to arbitrate access to the separate D-AHB and I-AHB by the Config Bus and the external memories bus.

3.3.6 Embedded Trace Macrocell (ETM) and Embedded Trace Buffer (ETB)

To support real-time trace, the ARM926EJ-S processor provides an interface to enable connection of an Embedded Trace Macrocell (ETM). The ARM926EJ-S Subsystem in the device also includes the Embedded Trace Buffer (ETB). The ETM consists of two parts:

- Trace Port provides real-time trace capability for the ARM9.
- Triggering facilities provide trigger resources, which include address and data comparators, counter, and sequencers.

The device trace port is not pinned out and is instead only connected to the Embedded Trace Buffer. The ETB has a 4KB buffer memory. ETB enabled debug tools are required to read/interpret the captured trace data.

This device uses ETM9™ version r2p2 and ETB version r0p1. Documentation on the ETM and ETB is available from ARM Ltd. Reference the 'CoreSight™ ETM9™ Technical Reference Manual, revision r0p1' and the 'ETM9 Technical Reference Manual, revision r2p2'.

3.3.7 ARM Memory Mapping

By default the ARM has access to most on and off chip memory areas, EMIFA, EMIFB, and the additional 128K byte on chip SRAM. Likewise almost all of the on chip peripherals are accessible to the ARM by default.

To improve security and/or robustness, the device has extensive memory and peripheral protection units which can be configured to limit access rights to the various on/off chip resources to specific hosts; including the ARM as well as other master peripherals. This allows the system tasks to be partitioned between the ARM and DSP as best suites the particular application; while enhancing the overall robustness of the solution.

See [Table 3-2](#) for a detailed top level device memory map that includes the ARM memory space.

3.4 Memory Map Summary

Table 3-2. AM1705 Top Level Memory Map

Start Address	End Address	Size	ARM Mem Map	EDMA Mem Map	PRUSS Mem Map	Master Peripheral Mem Map

3.5 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings.

3.5.1 Pin Map (Bottom View)

Figure 3-1. Pin Map (PTP)

3.6 Terminal Functions

Table 3-3 to Table 3-20 identify the external signal names, the associated pin/ball numbers along with the mechanical package designator, the pin type (I, O, IO, OZ, or PWR), whether the pin/ball has any internal pullup/pulldown resistors, whether the pin/ball is configurable as an IO in GPIO mode, and a functional pin description.

3.6.1 Device Reset and JTAG

Table 3-3. Reset and JTAG Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	DESCRIPTION
	PTP			
RESET				
$\overline{\text{RESET}}$	146	I		Device reset input
JTAG				
TMS	152	I	IPU	JTAG test mode select
TDI	153	I	IPU	JTAG test data input
TDO	156	O	IPD	JTAG test data output
TCK	155	I	IPU	JTAG test clock
$\overline{\text{TRST}}$	150	I	IPD	JTAG test reset
RTCK / GP7[14]	157	I/O	IPD	JTAG Test Clock Return Clock Output

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.2 High-Frequency Oscillator and PLL

Table 3-4. High-Frequency Oscillator and PLL Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	DESCRIPTION
	PTP			
1.2-V OSCILLATOR				
OSCIN	143	I		Oscillator input
OSCOUT	145	O		Oscillator output
OSCVSS	144	GND		Oscillator ground
1.2-V PLL				
PLL0_VDDA	141	PWR		PLL analog V_{DD} (1.2-V filtered supply)
PLL0_VSSA	142	GND		PLL analog V_{SS} (for filter)

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.3 External Memory Interface A (ASYNC)

Table 3-5. External Memory Interface A (EMIFA) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
EMA_D[7] /MMCS_DAT[7]/GP0[7]/BOOT[13]	54	I/O	IPU	MMC/SD, GPIO, BOOT	EMIFA data bus
EMA_D[6] /MMCS_DAT[6]/GP0[6]	52	I/O	IPU	MMC/SD, GPIO	
EMA_D[5] /MMCS_DAT[5]/GP0[5]	51	I/O	IPU		
EMA_D[4] /MMCS_DAT[4]/GP0[4]	49	I/O	IPU		
EMA_D[3] /MMCS_DAT[3]/GP0[3]	48	I/O	IPU		
EMA_D[2] /MMCS_DAT[2]/GP0[2]	46	I/O	IPU		
EMA_D[1] /MMCS_DAT[1]/GP0[1]	45	I/O	IPU		
EMA_D[0] /MMCS_DAT[0]/GP0[0]/BOOT[12]	44	I/O	IPU	MMC/SD, GPIO, BOOT	EMIFA address bus
EMA_A[12] /GP1[12]	42	O	IPU	GPIO	
EMA_A[11] /GP1[11]	41	O	IPU		
EMA_A[10] /GP1[10]	27	O	IPU		
EMA_A[9] /GP1[9]	40	O	IPU		
EMA_A[8] /GP1[8]	39	O	IPU		
EMA_A[7] /GP1[7]	37	O	IPD		
EMA_A[6] /GP1[6]	36	O	IPD		
EMA_A[5] /GP1[5]	35	O	IPD		
EMA_A[4] /GP1[4]	34	O	IPD		
EMA_A[3] /GP1[3]	32	O	IPD		MMCSD, GPIO
EMA_A[2] /MMCS_D_CMD/GP1[2]	31	O	IPU		
EMA_A[1] /MMCS_D_CLK/GP1[1]	30	O	IPU		
EMA_A[0] /GP1[0]	29	O	IPD	GPIO	EMIFA bank address
EMA_BA[1] /GP1[13]	26	O	IPU		
EMA_BA[0] /GP1[14]	25	O	IPU	GPIO	EMIFA Async Chip Select
EMA_CS[3] /GP2[6]	21	O	IPU	GPIO	
EMA_CS[2] /GP2[5]/BOOT[15]	23	O	IPU	GPIO, BOOT	EMIFA output enable
EMA_OE /AXR0[13]/GP2[7]	22	O	IPU	McASP0, GPIO	
EMA_WAIT[0] /GP2[10]	19	I	IPU	GPIO	EMIFA wait input/interrupt

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.4 External Memory Interface B (SDRAM only)

Table 3-6. External Memory Interface B (EMIFB) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION		
	PTP						
EMB_D[15]/GP6[15]	74	I/O	IPD	GPIO	EMIFB SDRAM data bus		
EMB_D[14]/GP6[14]	76	I/O	IPD

EMB_WE_DQM[0] /GP5[15]	60	O	IPU				

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.5 Serial Peripheral Interface Modules (SPI0, SPI1)

Table 3-7. Serial Peripheral Interface (SPI) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
SPI0					
SPI0_SCS[0] / $\overline{\text{UART0_RTS}}$ /EQEP0B/GP5[4]/BOOT[4]	9	I/O	IPU	UART0, EQEP0B, GPIO, BOOT	SPI0 chip select
SPI0_ENA / $\overline{\text{UART0_CTS}}$ /EQEP0A/GP5[3]/BOOT[3]	12	I/O	IPU	UART0, EQEP0A, GPIO, BOOT	SPI0 enable
SPI0_CLK /EQEP1I/GP5[2]/BOOT[2]	11	I/O	IPD	eQEP1, GPIO, BOOT	SPI0 clock
SPI0_SIMO[0] /EQEP0S/GP5[1]/BOOT[1]	18	I/O	IPD	eQEP0, GPIO, BOOT	SPI0 data slave-in-master-out
SPI0_SOMI[0] /EQEP0I/GP5[0]/BOOT[0]	17	I/O	IPD		SPI0 data slave-out-master-in
SPI1					
SPI1_SCS[0] / $\overline{\text{UART2_TXD}}$ /GP5[13]	8	I/O	IPU	UART2, GPIO	SPI1 chip select
SPI1_ENA / $\overline{\text{UART2_RXD}}$ /GP5[12]	7	I/O	IPU		SPI1 enable
SPI1_CLK /EQEP1S/GP5[7]/BOOT[7]	16	I/O	IPD	eQEP1, GPIO, BOOT	SPI1 clock
SPI1_SIMO[0] /I2C1_SDA/GP5[6]/BOOT[6]	14	I/O	IPU	I2C1, GPIO, BOOT	SPI1 data slave-in-master-out
SPI1_SOMI[0] /I2C1_SCL/GP5[5]/BOOT[5]	13	I/O	IPU		SPI1 data slave-out-master-in

(1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.6 Enhanced Capture/Auxiliary PWM Modules (eCAP0, eCAP1, eCAP2)

The eCAP Module pins function as either input captures or auxiliary PWM 32-bit outputs, depending upon how the eCAP module is programmed.

Table 3-8. Enhanced Capture Module (eCAP) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
eCAP0					
ACLKX0/ECAP0/APWM0/GP2 [12]	126	I/O	IPD	McASP0, GPIO	enhanced capture 0 input or auxiliary PWM 0 output
eCAP1					
ACLKR0/ECAP1/APWM1/GP2 [15]	130	I/O	IPD	McASP0, GPIO	enhanced capture 1 input or auxiliary PWM 1 output
eCAP2					
ACLKR1/ECAP2/APWM2/GP4 [12]	165	I/O	IPD	McASP1, GPIO	enhanced capture 2 input or auxiliary PWM 2 output

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.7 Enhanced Pulse Width Modulators (eHRPWM0, eHRPWM1, eHRPWM2)

Table 3-9. Enhanced Pulse Width Modulator (eHRPWM) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
eHRPWM0					
ACLKX1/ EPWM0A /GP3[15]	162	I/O	IPD	McASP1, GPIO	eHRPWM0 A output (with high-resolution)
AHCLKX1/ EPWM0B /GP3[14]	160	I/O	IPD		eHRPWM0 B output
AMUTE1/ EPWMTZ /GP4[14]	132	I/O	IPD	McASP1, eHRPWM1, GPIO, eHRPWM2	eHRPWM0 trip zone input
AFSX1/ EPWMSYNCI / EPWMSYNCO /GP4[10]	163	I/O	IPD	McASP1, eHRPWM0, GPIO	Sync input to eHRPWM0 module or sync output to external PWM
eHRPWM1					
AXR1[8]/ EPWM1A /GP4[8]	168	I/O	IPD	McASP1, GPIO	eHRPWM1 A (with high-resolution)
AXR1[7]/ EPWM1B /GP4[7]	169	I/O	IPD		eHRPWM1 B output
AMUTE1/ EPWMTZ /GP4[14]	132	I/O	IPD	McASP1, eHRPWM0, GPIO, eHRPWM2	eHRPWM1 trip zone input
eHRPWM2					
AXR1[6]/ EPWM2A /GP4[6]	170	I/O	IPD	McASP1, GPIO	eHRPWM2 A (with high-resolution)
AXR1[5]/ EPWM2B /GP4[5]	171	I/O	IPD		eHRPWM2 B output
AMUTE1/ EPWMTZ /GP4[14]	132	I/O	IPD	McASP1, eHRPWM0, GPIO, eHRPWM2	eHRPWM2 trip zone input

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.8 Enhanced Quadrature Encoder Pulse Module (eQEP)

Table 3-10. Enhanced Quadrature Encoder Pulse Module (eQEP) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
eQEP0					
SPI0_ENA/ UART0_CTS/EQEP0A /GP5[3]/BOOT[3]	12	I	IPU	SPI0, UART0, GPIO, BOOT	eQEP0A quadrature input
SPI0_SCS[0]/ UART0_RTS/EQEP0B /GP5[4]/BOOT[4]	9	I	IPU		eQEP0B quadrature input
SPI0_SOMI[0]/ EQEP0I /GP5[0]/BOOT[0]	17	I	IPD	SPI0, GPIO, BOOT	eQEP0 index
SPI0_SIMO[0]/ EQEP0S /GP5[1]/BOOT[1]	18	I	IPD		eQEP0 strobe
eQEP1					
AXR1[3]/ EQEP1A /GP4[3]	174	I	IPD	McASP1, GPIO	eQEP1A quadrature input
AXR1[4]/ EQEP1B /GP4[4]	173	I	IPD		eQEP1B quadrature input
SPI0_CLK/ EQEP1I /GP5[2]/BOOT[2]	11	I	IPD	SPI0, GPIO, BOOT	eQEP1 index
SPI1_CLK/ EQEP1S /GP5[7]/BOOT[7]	16	I	IPD	SPI1, GPIO, BOOT	eQEP1 strobe

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.9 Boot

Table 3-11. Boot Terminal Functions⁽¹⁾

SIGNAL NAME	PIN NO	TYPE ⁽²⁾	PULL ⁽³⁾	MUXED	DESCRIPTION
	PTP				
EMA_CS[2]/GP2[5]/BOOT[15]	23	I	IPU	EMIFA, GPIO	Boot Selection Signals
EMA_WE/AXR0[12]/GP2[3]/BOOT[14]	55	I	IPU	EMIFA, McASP0, GPIO	
EMA_D[7]/MMCS_DAT[7]/GP0[7]/BOOT[13]	54	I	IPU	EMIFA, MMC/SD, GPIO	
EMA_D[0]/MMCS_DAT[0]/GP0[0]/BOOT[12]	44	I	IPU		
AHCLKR0/RMII_MHZ_50_CLK/GP2[14]/BOOT[11]	129	I	IPD	McASP0, EMAC, GPIO	
AFSX0/GP2[13]/BOOT[10]	127	I	IPD	McASP0, GPIO	
UART0_TXD/I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	I	IPU	UART0, I2C0, Timer0, GPIO	
UART0_RXD/I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	I	IPU	UART0, I2C0, Timer0, GPIO	
SPI1_CLK/EQEP1S/GP5[7]/BOOT[7]	16	I	IPD	SPI1, eQEP1, GPIO	
SPI1_SIMO[0]/I2C1_SDA/GP5[6]/BOOT[6]	14	I	IPU	SPI1, I2C1, GPIO	
SPI1_SOMI[0]/I2C1_SCL/GP5[5]/BOOT[5]	13	I	IPU		
SPI0_SCS[0]/UART0_RTS/EQEP0B/GP5[4]/BOOT[4]	9	I	IPU	SPI0, UART0, eQEP0, GPIO	
SPI0_ENA/UART0_CTS/EQEP0A/GP5[3]/BOOT[3]	12	I	IPU	SPI0, UART0, eQEP0, GPIO	
SPI0_CLK/EQEP1I/GP5[2]/BOOT[2]	11	I	IPD	SPI0, eQEP1, GPIO	
SPI0_SIMO[0]/EQEP0S/GP5[1]/BOOT[1]	18	I	IPD	SPI0, eQEP0, GPIO	
SPI0_SOMI[0]/EQEP0I/GP5[0]/BOOT[0]	17	I	IPD		

(1) Boot decoding will be defined in the ROM datasheet.

(2) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.

Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.

(3) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.10 Universal Asynchronous Receiver/Transmitters (UART0, UART1, UART2)

Table 3-12. Universal Asynchronous Receiver/Transmitter (UART) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
UART0					
UART0_RXD /I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	I	IPU	I2C0, BOOT, Timer0, GPIO,	UART0 receive data
UART0_TXD /I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	O	IPU	I2C0, Timer0, GPIO, BOOT	UART0 transmit data
SPI0_SCS [0]/ UART0_RTS /EQEP0B/GP5[4]/BOOT[4]	9	O	IPU	SPI0, eQEP0, GPIO, BOOT	UART0 ready-to-send output
SPI0_ENA / UART0_CTS /EQEP0A/GP5[3]/BOOT[3]	12	I	IPU		UART0 clear-to-send input
UART1					
UART1_RXD /AXR0[9]/GP3[9] ⁽³⁾	122	I	IPD	McASP0, GPIO	UART1 receive data
UART1_TXD /AXR0[10]/GP3[10] ⁽³⁾	123	O	IPD		UART1 transmit data
UART2					
SPI1_ENA / UART2_RXD /GP5[12]	7	I	IPU	SPI1, GPIO	UART2 receive data
SPI1_SCS [0]/ UART2_TXD /GP5[13]	8	O	IPU		UART2 transmit data

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor
- (3) As these signals are internally pulled down while the device is in reset, it is necessary to externally pull them high with resistors if UART1 boot mode is used.

3.6.11 Inter-Integrated Circuit Modules(I2C0, I2C1)

Table 3-13. Inter-Integrated Circuit (I2C) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
I2C0					
UART0_RXD /I2C0_SDA/TM64P0_IN12/GP5[8]/BOOT[8]	2	I/O	IPU	UART0, Timer0, GPIO, BOOT	I2C0 serial data
UART0_TXD /I2C0_SCL/TM64P0_OUT12/GP5[9]/BOOT[9]	3	I/O	IPU	UART0, Timer0, GPIO, BOOT	I2C0 serial clock
I2C1					
SPI1_SIMO [0]/ I2C1_SDA /GP5[6]/BOOT[6]	14	I/O	IPU	SPI1, GPIO, BOOT	I2C1 serial data
SPI1_SOMI [0]/ I2C1_SCL /GP5[5]/BOOT[5]	13	I/O	IPU		I2C1 serial clock

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.12 Timers

Table 3-14. Timers Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
TIMER0					
UART0_RXD/I2C0_SDA/ TM64P0_IN12 /GP5[8]/BOOT[8]	2	I	IPU	UART0, I2C0, GPIO, BOOT	Timer0 lower input
UART0_TXD/I2C0_SCL/ TM64P0_OUT12 /GP5[9]/BOOT[9]	3	O	IPU		Timer0 lower output
TIMER1 (Watchdog)					
No external pins. The Timer1 peripheral pins are not pinned out as external pins.					

- (1) I = Input, O = Output, I/O = Bidirectional, Z = High impedance, PWR = Supply voltage, GND = Ground, A = Analog signal.
Note: The pin type shown refers to the input, output or high-impedance state of the pin function when configured as the the signal name highlighted in bold. All multiplexed signals may enter a high-impedance state when the configured function is input-only or the configured function supports high-Z operation. All GPIO signals can be used as input or output. For multiplexed pins where functions have different types (i.e., input versus output), the table reflects the pin function direction for that particular peripheral.
- (2) IPD = Internal Pulldown resistor, IPU = Internal Pullup resistor

3.6.13 Multichannel Audio Serial Ports (McASP0, McASP1)

Table 3-15. Multichannel Audio Serial Ports (McASPs) Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	PULL ⁽²⁾	MUXED	DESCRIPTION
	PTP				
McASP0					
EMA_OE /AXR0[13]/GP2[7]	22	I/O	IPU	EMIFA, GPIO	McASP0 serial data
EMA_WE /AXR0[12]/GP2[3]/BOOT[14]	55	I/O	IPU	EMIFA, GPIO, BOOT	
AXR0 [11] / GP3[11]	124	I/O	IPD	McASP2, GPIO	
UART1_TXD/ AXR0 [10]/GP3[10]	123	I/O	IPD	GPIO

3.6.17 Reserved and No Connect

Table 3-19. Reserved and No Connect Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	DESCRIPTION
	PTP		
RSV2	133	-	Reserved. For proper device operation, this pin must be tied directly to CV _{DD} .
RSV3	149	PWR	Reserved. For proper device operation, this pin must be tied directly to CV _{DD} or left unconnected [do not connect to ground (VSS)].
RSV4	148	I	Reserved. For proper device operation, this pin must be tied low or to CV _{DD} .
NC	136	-	No Connect (leave unconnected)
NC	139	-	No Connect (leave unconnected)

- (1) PWR = Supply voltage.

3.6.18 Supply and Ground

Table 3-20. Supply and Ground Terminal Functions

SIGNAL NAME	PIN NO	TYPE ⁽¹⁾	DESCRIPTION
	PTP		
CVDD (Core supply)	10, 20, 28, 38, 50, 56, 61, 69, 77, 93, 104, 114, 147, 154, 161, 167	PWR	Core supply voltage pins
RVDD (Internal RAM supply)	67, 159	PWR	Internal ram supply voltage pins
DVDD (I/O supply)	5, 15, 24, 33, 43, 47, 53, 58, 65, 71, 75, 81, 87, 90, 99, 109, 119, 128, 151, 158, 164, 172	PWR	I/O supply voltage pins
VSS (Ground)	177	GND	Ground pins

(1) PWR = Supply voltage, GND - Ground.

3.6.19 Unused USB0 (USB2.0) Pin Configurations

Table 3-21. Unused USB0 Pin Configurations

SIGNAL NAME	Configuration (When USB0 is not used)
USB0_DM	No connect
USB0_DP	No connect
USB0_VDDA33	No connect
USB0_VDDA18	No connect
USB0_VDDA12	Internal USB0 PHY output connected to an external 0.22 μ F filter capacitor, even if USB0 is not used.
AHCLKX0/USB_REFCLKIN/ GP2[11]	No connect or use as alternate function

4 Device Configuration

4.1 Boot Modes

This device supports a variety of boot modes through an internal ROM bootloader. This device does not support dedicated hardware boot modes; therefore, all boot modes utilize the internal ROM. The input states of the BOOT pins are sampled and latched into the BOOTCFG register, which is part of the system configuration (SYSCFG) module, when device reset is deasserted. Boot mode selection is determined by the values of the BOOT pins

The following boot modes are supported:

- NAND Flash boot
 - 8-bit NAND
- NOR Flash boot
 - NOR Direct boot (8-bit)
 - NOR Legacy boot (8-bit)
 - NOR AIS boot (8-bit)
- I2C0 / I2C1 Boot
 - EEPROM (Master Mode)
 - External Host (Slave Mode)
- SPI0 / SPI1 Boot
 - Serial Flash (Master Mode)
 - SERIAL EEPROM (Master Mode)
 - External Host (Slave Mode)
- UART0 / UART1 / UART2 Boot
 - External Host

4.2 SYSCFG Module

The following system level features of the chip are controlled by the SYSCFG peripheral:

- Readable Device, Die, and Chip Revision ID
- Control of Pin Multiplexing
- Priority of bus accesses different bus masters in the system
- Capture at power on reset the chip BOOT[15:0] pin values and make them available to software
- Special case settings for peripherals:
 - Locking of PLL controller settings
 - Default burst sizes for EDMA3 TC0 and TC1
 - Selection of the source for the eCAP module input capture (including on chip sources)
 - McASP AMUTEIN selection and clearing of AMUTE status for the three McASP peripherals
 - Control of the reference clock source and other side-band signals for both of the integrated USB PHYs
 - Clock source selection for EMIFA and EMIFB
- Selects the source of emulation suspend signal of peripherals supporting this function.

Many registers are accessible only by a host (ARM) when it is operating in its privileged mode. (ex. from the kernel, but not from user space code).

4.3 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- **Boot and Configuration Pins:** If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is strongly recommended, even if the IPU/IPD matches the desired value/state.
- **Other Input Pins:** If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the boot and configuration pins, if they are both routed out and 3-stated (not driven), it is strongly recommended that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the IO supply rail.
- For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the device, see [Section 5.3](#), Recommended Operating Conditions.
- For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Junction Temperature Range (Unless Otherwise Noted) ⁽¹⁾

Supply voltage ranges	Core (CVDD, RVDD, PLL0_VDDA) ⁽²⁾	-0.5 V to 1.4 V
	I/O, 1.8V (USB0_VDDA18) ⁽²⁾	-0.5 V to 2 V
	I/O, 3.3V (DVDD, USB0_VDDA33) ⁽²⁾	-0.5 V to 3.8V
Input voltage ranges	V _I I/O, 1.2V (OSCIN)	-0.3 V to CVDD + 0.3V
	V _I I/O, 3.3V (Steady State)	-0.3V to DVDD + 0.35V
	V _I I/O, 3.3V (Transient)	DVDD + 20% up to 20% of Signal Period
	V _I I/O, USB 5V Tolerant Pins: (USB0_DM, USB0_DP)	5.25V ⁽³⁾
Output voltage ranges	V _O I/O, 3.3V (Steady State)	-0.5 V to DVDD + 0.3V
	V _O I/O, 3.3V (Transient Overshoot/Undershoot)	20% of DVDD for up to 20% of the signal period
Clamp Current	Input or Output Voltages 0.3V above or below their respective power rails. Limit clamp current that flows through the I/O's internal diode protection cells.	±20mA
Operating Junction Temperature ranges, T _J	Commercial (default)	0°C to 90°C
	Industrial (D version)	-40°C to 90°C
	Extended (A version)	-40°C to 105°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to VSS, PLL0_VSSA, OSCVSS
- (3) Up to a max of 24 hours.

5.2 Handling Ratings

			UNIT
Storage temperature range, T _{stg}	(default)	-55 to 150	°C
ESD Stress Voltage, V _{ESD} ⁽¹⁾	Human Body Model (HBM) ⁽²⁾	>2000	V
	Charged Device Model (CDM) ⁽³⁾	>500	V

- (1) Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.
- (2) Level listed above is the passing level per ANSI/ESDA/JEDEC JS-001-2010. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500V HBM is possible if necessary precautions are taken. Pins listed as 1000V may actually have higher performance.
- (3) Level listed above is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 250V may actually have higher performance.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT	
CVDD	Supply voltage, Core (CVDD, PLL0_VDDA)	375 MHz version	1.14	1.2	1.32	V
		456 MHz version	1.25	1.3	1.35	V
RVDD	Supply Voltage, Internal RAM	375 MHz version	1.14	1.2	1.32	V
		456 MHz version	1.25	1.3	1.35	V
DVDD	Supply voltage, I/O, 1.8V (USB0_VDDA18)	1.71	1.8	1.89	V	
	Supply voltage, I/O, 3.3V (DVDD, USB0_VDDA33)	3.0	3.3	3.45	V	
VSS	Supply ground (VSS, PLL0_VSSA, OSCVSS ⁽¹⁾)	0	0	0	V	
V _{IH} ⁽²⁾	High-level input voltage, I/O, 3.3V	2			V	
	High-level input voltage, OSCIN	0.7*CVDD			V	
V _{IL} ⁽²⁾	Low-level input voltage, I/O, 3.3V			0.8	V	
	Low-level input voltage, OSCIN			0.3*CVDD	V	
V _{HYS}	Input Hysteresis		160		mV	
t _t	Transition time, 10%-90%, All Inputs (unless otherwise specified in the electrical data sections)			0.25P or 10 ⁽³⁾	ns	
F _{SYSCLK6}	ARM Operating Frequency (SYSCLK6)	Commercial (default)	0		375 (1.2V) 456 (1.3V)	MHz
		Industrial (D suffix)	0		456 (1.3V)	MHz
		Extended (A suffix)	0		375(1.2V)	MHz

- (1) When an external crystal is used, oscillator (OSC_VSS) ground must be kept separate from other grounds and connected directly to the crystal load capacitor ground. These pins are shorted to VSS on the device itself and should not be connected to VSS on the circuit board. If a crystal is not used and the clock input is driven directly, then the oscillator VSS may be connected to board ground.
- (2) Unless specifically indicated, these I/O specifications do not apply to USB I/Os. USB0 I/Os adhere to USB2.0 specification.
- (3) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

5.4 Notes on Recommended Power-On Hours (POH)

The information in the section below is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

To avoid significant degradation, the device power-on hours (POH) must be limited to the following:

Table 5-1. Recommended Power-On Hours

Silicon Revision	Speed Grade	Operating Junction Temperature (T _j)	Nominal CVDD Voltage (V)	Power-On Hours [POH] (hours)
D	375 MHz	0 to 90 °C	1.2V	100,000
D	375 MHz	-40 to 105 °C	1.2V	75,000 ⁽¹⁾
D	456 MHz	0 to 90 °C	1.3V	100,000
D	456 MHz	-40 to 90 °C	1.3V	100,000

(1) 100,000 POH can be achieved at this temperature condition if the device operation is limited to 345 MHz.

Note: Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

The above notations cannot be deemed a warranty or deemed to extend or modify the warranty under TI's standard terms and conditions for TI semiconductor products.

5.5 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Junction Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OH} ⁽¹⁾	High-level output voltage (3.3V I/O)	DVDD= 3.15V, I _{OH} = -4 mA	2.4			V
		DVDD= 3.15V, I _{OH} = 100 μA	2.95			V
V _{OL} ⁽¹⁾	Low-level output voltage (3.3V I/O)	DVDD= 3.15V, I _{OL} = 4mA			0.4	V
		DVDD= 3.15V, I _{OL} = -100 μA			0.2	V
I _I ^{(2) (1)}	Input current	V _I = VSS to DVDD without opposing internal resistor			±35	μA
		V _I = VSS to DVDD with opposing internal pullup resistor ⁽³⁾	-30		-200	μA
		V _I = VSS to DVDD with opposing internal pulldown resistor ⁽³⁾	50		300	μA
I _{OH} ⁽¹⁾	High-level output current				-4	mA
I _{OL} ⁽¹⁾	Low-level output current				4	mA
I _{OZ} ⁽⁴⁾	I/O Off-state output current	VO = VDD or VSS; Internal pull disabled			±35	μA
C _I	Input capacitance	LVC MOS signals			3	pF
		OSCIN			2	pF
C _O	Output capacitance	LVC MOS signals			3	pF

- (1) These I/O specifications apply to regular 3.3V I/Os and do not apply to USB0 unless specifically indicated. USB0 I/Os adhere to the USB 2.0 specification.
- (2) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (3) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (4) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information

6.1.1 Parameter Information Device-Specific Information

- A. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings. Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin and the input signals are driven between 0V and the appropriate IO supply rail for the signal.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1.1 Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, $V_{ref} = 1.65$ V. For 1.8 V I/O, $V_{ref} = 0.9$ V. For 1.2 V I/O, $V_{ref} = 0.6$ V.

Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks.

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

6.3.1 Power-on Sequence

The device should be powered-on in the following order:

1. Core logic supplies:
 - (a) CVDD core logic supply
 - (b) Other 1.2V logic supplies (PLL0_VDDA). Groups 1a) and 1b) may be powered up together or 1a) first followed by 1b).
2. All 1.8V IO supplies (USB0_VDDA18).
3. All digital IO and analog 3.3V PHY supplies (DVDD, USB0_VDDA33).

Group 2) and group 3) may be powered on in either order [2 then 3, or 3 then 2] but group 3) must be powered-on after the core logic supplies.

There is no specific required voltage ramp rate for any of the supplies.

RESET must be maintained active until all power supplies have reached their nominal values.

6.3.2 Power-off Sequence

The power supplies can be powered-off in any order as long as the 3.3V supplies do not remain powered with the other supplies unpowered.

6.4 Reset

6.4.1 Power-On Reset (POR)

A power-on reset (POR) is required to place the device in a known good state after power-up. Power-On Reset is initiated by bringing $\overline{\text{RESET}}$ and $\overline{\text{TRST}}$ low at the same time. POR sets all of the device internal logic to its default state. All pins are tri-stated with the exception of RTCK/GP7[14]. If an emulator is driving TCK into the device during reset, then RTCK/GP7[14] will drive out RTCK. If TCK is not being driven into the device during reset, then RTCK/GP7[14] will drive low.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the device to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and device's emulation logic in the reset state.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. Note: $\overline{\text{TRST}}$ is synchronous and must be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

$\overline{\text{RESET}}$ must be released only in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$. For maximum reliability, the device includes an internal pulldown on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

RTCK/GP7[14] is maintained active through a POR.

A summary of the effects of Power-On Reset is given below:

- All internal logic (including emulation logic and the PLL logic) is reset to its default state
- Internal memory is not maintained through a POR
- All device pins go to a high-impedance state

CAUTION: A watchdog reset triggers a POR.

6.4.2 Warm Reset

A warm reset provides a limited reset to the device. Warm Reset is initiated by bringing only $\overline{\text{RESET}}$ low ($\overline{\text{TRST}}$ is maintained high through a warm reset). Warm reset sets certain portions of the device to their default state while leaving others unaltered. All pins are 3-stated with the exception of RTCK/GP7[14]. If an emulator is driving TCK into the device during reset, then RTCK/GP7[14] will drive out RTCK. If TCK is not being driven into the device during reset, then RTCK/GP7[14] will drive low.

During emulation, the emulator will maintain $\overline{\text{TRST}}$ high and hence only warm reset (not POR) is available during emulation debug and development.

RTCK/GP7[14] is maintained active through a warm reset.

A summary of the effects of Warm Reset is given below:

- All internal logic (except for the emulation logic and the PLL logic) is reset to its default state
- Internal memory is maintained through a warm reset
- All device pins go to a high-impedance state

6.4.3 Reset Electrical Data Timings

Table 6-1 assumes testing over the recommended operating conditions.

Table 6-1. Reset Timing Requirements⁽¹⁾

N o.		MIN	MAX	UNIT
1	$t_{w(RSTL)}$			ns
2	$t_{su(BPV-RSTH)}$			ns
3	$t_{h(RSTH-BPV)}$			ns

(1) For power-on reset (POR), the reset timings in this table refer to \overline{RESET} and \overline{TRST} together. For warm reset, the reset timings in this table refer to \overline{RESET} only (\overline{TRST} is held high).

Figure 6-4. Power-On Reset (RESET and TRST active) Timing

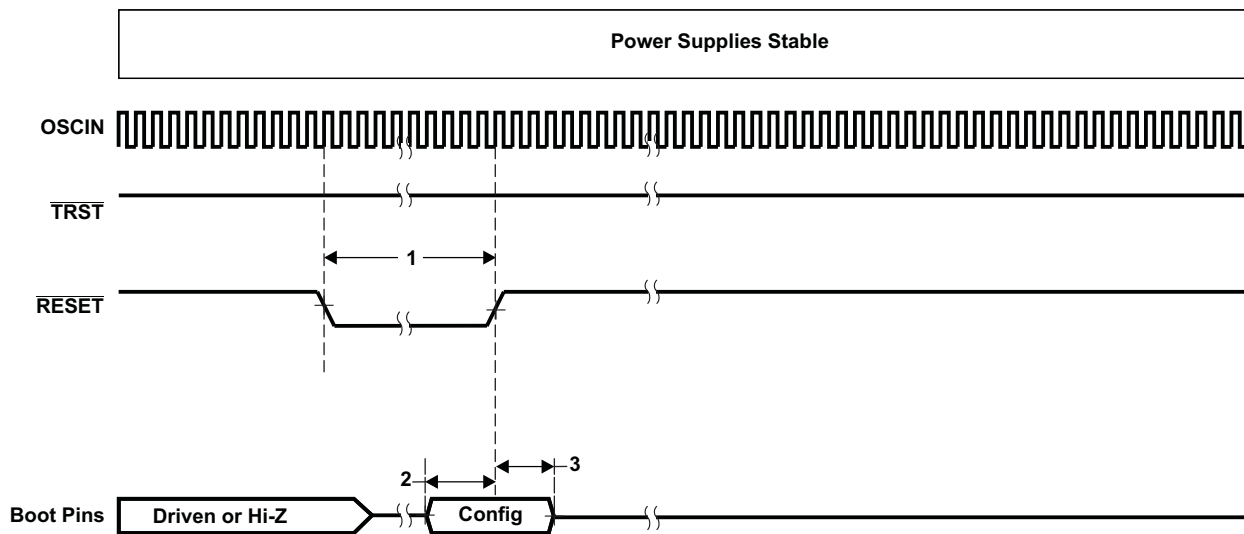

Figure 6-5. Warm Reset (RESET active, TRST high) Timing

6.5 Crystal Oscillator or External Clock Input

The device includes two choices to provide an external clock input, which is fed to the on-chip PLL to generate high-frequency system clocks. These options are illustrated in [Figure 6-6](#) and [Figure 6-7](#). For input clock frequencies between 12 and 20 MHz, a crystal with 80 ohm max ESR is recommended. For input clock frequencies between 20 and 30 MHz, a crystal with 60 ohm max ESR is recommended. Typical load capacitance values are 10-20 pF, where the load capacitance is the series combination of C1 and C2.

The CLKMODE bit in the PLLCTL register must be 0 to use the on-chip oscillator. If CLKMODE is set to 1, the internal oscillator is disabled.

- [Figure 6-6](#) illustrates the option that uses on-chip 1.2V oscillator with external crystal circuit.
- [Figure 6-7](#) illustrates the option that uses an external 1.2V clock input.

Figure 6-6. On-Chip 1.2V Oscillator

Table 6-2. Oscillator Timing Requirements

PARAMETER		MIN	MAX	UNIT
f_{osc}	Oscillator frequency range (OSCIN/OSCOUT)	12	30	MHz

Figure 6-7. External 1.2V Clock Source

Table 6-3. OSCIN Timing Requirements

PARAMETER		MIN	MAX	UNIT
f_{OSCIN}	OSCIN frequency range (OSCIN)	12	50	MHz
$t_{\text{c}}(\text{OSCIN})$	Cycle time, external clock driven on OSCIN	20		ns
$t_{\text{w}}(\text{OSCINH})$	Pulse width high, external clock on OSCIN	$0.4 t_{\text{c}}(\text{OSCIN})$		ns
$t_{\text{w}}(\text{OSCINL})$	Pulse width low, external clock on OSCIN	$0.4 t_{\text{c}}(\text{OSCIN})$		ns
$t_{\text{t}}(\text{OSCIN})$	Transition time, OSCIN		$0.25P$ or $10^{(1)}$	ns
$t_{\text{j}}(\text{OSCIN})$	Period jitter, OSCIN		$0.02P$	ns

(1) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

6.6 Clock PLLs

The device has one PLL controller that provides clock to different parts of the system. PLL0 provides clocks (though various dividers) to most of the components of the device.

The PLL controller provides the following:

- Glitch-Free Transitions (on changing clock settings)
- Domain Clocks Alignment
- Clock Gating
- PLL power down

The various clock outputs given by the controller are as follows:

- Domain Clocks: SYSCLK [1:n]
- Auxiliary Clock from reference clock source: AUXCLK

Various dividers that can be used are as follows:

- Post-PLL Divider: POSTDIV
- SYSCLK Divider: D1, $\frac{1}{4}$, Dn

Various other controls supported are as follows:

- PLL Multiplier Control: PLLM
- Software programmable PLL Bypass: PLEN

6.6.1 PLL Device-Specific Information

The PLL requires some external filtering components to reduce power supply noise as shown in [Figure 6-8](#).

Figure 6-8. PLL External Filtering Components

The input to the PLL is either from the on-chip oscillator (OSCIN pin) or from an external clock on the OSCIN pin. The PLL outputs seven clocks that have programmable divider options. [Figure 6-9](#) illustrates the PLL Topology.

The PLL is disabled by default after a device reset. It must be configured by software according to the allowable operating conditions listed in [Table 6-4](#) before enabling the processor to run from the PLL by setting PLEN = 1.

Figure 6-9. PLL Topology

Table 6-4. Allowed PLL Operating Conditions

No.	PARAMETER	Default Value	MIN	MAX	UNIT
1	PLLRST: Assertion time during initialization	N/A	1000	N/A	ns
2	Lock time: The time that the application has to wait for the PLL to acquire locks before setting PLEN, after changing PREDIV, PLLM, or OSCIN	N/A	N/A	$\text{Max PLL Lock Time} = \frac{2000 N}{\sqrt{m}}$ where N = Pre-Divider Ratio M = PLL Multiplier	OSCIN cycles
3	PREDIV	/1	/1	/32	
4	PLL input frequency (PLLREF)		12	30 (if internal oscillator is used) 50 (if external clock source is used)	MHz
5	PLL multiplier values (PLLM) ⁽¹⁾	x20	x4	x32	
6	PLL output frequency. (PLLOUT)	N/A	300	600	MHz
7	POSTDIV	/1	/1	/32	

- (1) The multiplier values must be chosen such that the PLL output frequency (at PLLOUT) is between 300 and 600 MHz, but the frequency going into the SYSCLK dividers (after the post divider) cannot exceed the maximum clock frequency defined for the device at a given voltage operating point.

6.6.2 Device Clock Generation

PLL0 is controlled by PLL Controller 0. The PLLC0 manages the clock ratios, alignment, and gating for the system clocks to the chip. The PLLC is responsible for controlling all modes of the PLL through software, in terms of pre-division of the clock inputs, multiply factor within the PLL, and post-division for each of the chip-level clocks from the PLL output. The PLLC also controls reset propagation through the chip, clock alignment, and test points.

6.6.3 PLL Controller 0 Registers

Table 6-5. PLL Controller 0 Registers

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION

6.7 Interrupts

6.7.1 ARM CPU Interrupts

The ARM9 CPU core supports 2 direct interrupts: FIQ and IRQ. The ARM Interrupt Controller extends the number of interrupts to 100, and provides features like programmable masking, priority, hardware nesting support, and interrupt vector generation.

6.7.1.1 ARM Interrupt Controller (AINTC) Interrupt Signal Hierarchy

The ARM Interrupt controller organizes interrupts into the following hierarchy:

- Peripheral Interrupt Requests
 - Individual Interrupt Sources from Peripherals
- 100 System Interrupts
 - One or more Peripheral Interrupt Requests are combined (fixed configuration) to generate a System Interrupt.
 - After prioritization, the AINTC will provide an interrupt vector based unique to each System Interrupt
- 32 Interrupt Channels
 - Each System Interrupt is mapped to one of the 32 Interrupt Channels
 - Channel Number determines the first level of prioritization, Channel 0 is highest priority and 31 lowest.
 - If more than one system interrupt is mapped to a channel, priority within the channel is determined by system interrupt number (0 highest priority)
- Host Interrupts (FIQ and IRQ)
 - Interrupt Channels 0 and 1 generate the ARM FIQ interrupt
 - Interrupt Channels 2 through 31 Generate the ARM IRQ interrupt
- Debug Interrupts
 - Two Debug Interrupts are supported and can be used to trigger events in the debug subsystem
 - Sources can be selected from any of the System Interrupts or Host Interrupts

6.7.1.2 AINTC Hardware Vector Generation

The AINTC also generates an interrupt vector in hardware for both IRQ and FIQ host interrupts. This may be used to accelerate interrupt dispatch. A unique vector is generated for each of the 100 system interrupts. The vector is computed in hardware as:

$$\text{VECTOR} = \text{BASE} + (\text{SYSTEM INTERRUPT NUMBER} \times \text{SIZE})$$

Where BASE and SIZE are programmable. The computed vector is a 32-bit address which may be dispatched to using a single instruction of type LDR PC, [PC, #-<offset_12>] at the FIQ and IRQ vector locations (0xFFFF0018 and 0xFFFF001C respectively).

6.7.1.3 AINTC Hardware Interrupt Nesting Support

Interrupt nesting occurs when an interrupt service routine re-enables interrupts, to allow the CPU to interrupt the ISR if a higher priority event occurs. The AINTC provides hardware support to facilitate interrupt nesting. It supports both global and per host interrupt (FIQ and IRQ in this case) automatic nesting. If enabled, the AINTC will automatically update an internal nesting register that temporarily masks interrupts at and below the priority of the current interrupt channel. Then if the ISR re-enables interrupts; only higher priority channels will be able to interrupt it. The nesting level is restored by the ISR by writing to the nesting level register on completion. Support for nesting can be enabled/disabled by software, with the option of automatic nesting on a global or per host interrupt basis; or manual nesting.

6.7.1.4 AINTC System Interrupt Assignments on the device

System Interrupt assignments for the device are listed in [Table 6-6](#)

Table 6-6. AINTC System Interrupt Assignments

System Interrupt	Interrupt Name	Source
0	COMMTX	ARM
1	COMMRX	ARM
2	NINT	ARM
3	PRU_EVTOUT0	PRUSS Interrupt
4	PRU_EVTOUT1	PRUSS Interrupt

6.8 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GPIO [0:15]).

The device GPIO peripheral supports the following:

- External Interrupt and DMA request Capability
 - Every GPIO pin may be configured to generate an interrupt request on detection of rising and/or falling edges on the pin.
 - The interrupt requests within each bank are combined (logical or) to create eight unique bank level interrupt requests.
 - The bank level interrupt service routine may poll the INTSTATx register for its bank to determine which pin(s) have triggered the interrupt.
 - GPIO Banks 0, 1, 2, 3, 4, 5, 6, and 7 Interrupts assigned to ARM INTC Interrupt Requests 42, 43, 44, 45, 46, 47, 48, and 49 respectively
 - Additionally, GPIO Banks 0, 1, 2, 3, 4, and 5 Interrupts assigned to EDMA events 6, 7, 22, 23, 28, and 29 respectively.
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in [Table 6-8](#).

6.8.1 GPIO Register Description(s)

Table 6-8. GPIO Registers

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION

Table 6-8. GPIO Registers (continued)

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01E2 60A8	CLR_FAL_TRIG67	GPIO Banks 6 and 7 Clear Falling Edge Interrupt Register
0x01E2 60AC	INTSTAT67	GPIO Banks 6 and 7 Interrupt Status Register

6.8.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-9. Timing Requirements for GPIO Inputs⁽¹⁾ (see Figure 6-10)

No.	PARAMETER	MIN	MAX	UNIT
1	$t_{w(GPIH)}$ Pulse duration, $GPn[m]$ as input high	$2C^{(1) (2)}$		ns
2	$t_{w(GPIL)}$ Pulse duration, $GPn[m]$ as input low	$2C^{(1) (2)}$		ns

- (1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the device recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to allow the device enough time to access the GPIO register through the internal bus.
- (2) $C = \text{SYSCLK4}$ period in ns.

Table 6-10. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-10)

No.	PARAMETER	MIN	MAX	UNIT
3	$t_{w(GPOH)}$ Pulse duration, $GPn[m]$ as output high	$2C^{(1) (2)}$		ns
4	$t_{w(GPOL)}$ Pulse duration, $GPn[m]$ as output low	$2C^{(1) (2)}$		ns

- (1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
- (2) $C = \text{SYSCLK4}$ period in ns.

**Figure 6-10. GPIO Port Timing**

6.8.3 GPIO Peripheral External Interrupts Electrical Data/Timing

Table 6-11. Timing Requirements for External Interrupts⁽¹⁾ (see Figure 6-11)

No.	PARAMETER	MIN	MAX	UNIT
1	$t_{w(LOW)}$ Width of the external interrupt pulse low	$2C^{(1) (2)}$		ns
2	$t_{w(HIGH)}$ Width of the external interrupt pulse high	$2C^{(1) (2)}$		ns

- (1) The pulse width given is sufficient to generate an interrupt or an EDMA event. However, if a user wants to have device recognize the GPIO changes through software polling of the GPIO register, the GPIO duration must be extended to allow the device enough time to access the GPIO register through the internal bus.
- (2) $C = \text{SYSCLK4}$ period in ns.

**Figure 6-11. GPIO External Interrupt Timing**

6.9 EDMA

Table 6-12 is the list of EDMA3 Channel Controller Registers and Table 6-13 is the list of EDMA3 Transfer Controller registers.

0x01C0 1008	ECR	Event Clear Register

(1) On previous architectures, the EDMA3TC priority was controlled by the queue priority register (QUEPRI) in the EDMA3CC memory-map. However for this device, the priority control for the transfer controllers is controlled by the chip-level registers in the System Configuration Module. You should use the chip-level registers and not QUEPRI to configure the TC priority.

6.10 External Memory Interface A (EMIFA)

EMIFA is one of two external memory interfaces supported on the device. It supports asynchronous memory types, such as NAND and NOR flash and Asynchronous SRAM.

6.10.1 EMIFA Asynchronous Memory Support

EMIFA supports asynchronous:

- SRAM memories
- NAND Flash memories
- NOR Flash memories

The device supports up to 13 address lines and an external wait/interrupt input. Up to 2 asynchronous chip selects are supported by EMIFA ($\overline{\text{EMA_CS}}[3:2]$).

Each chip select has the following individually programmable attributes:

- Data Bus Width
- Read cycle timings: setup, hold, strobe
- Write cycle timings: setup, hold, strobe
- Bus turn around time
- Extended Wait Option With Programmable Timeout
- Select Strobe Option
- NAND flash controller supports 1-bit and 4-bit ECC calculation on blocks of 512 bytes.

6.10.2 EMIFA Connection Examples

A likely use case with more than one EMIFA chip select used for NAND flash is illustrated in [Figure 6-12](#). This figure shows how two multiplane NAND flash devices with two chip selects each would connect to the EMIFA. In this case if NAND is the boot memory, then the boot image needs to be stored in the NAND area selected by $\overline{\text{EMA_CS}}[3]$. Part of the application image could spill over into the NAND regions selected by other EMIFA chip selects; but would rely on the code stored in the $\overline{\text{EMA_CS}}[3]$ area to bootload it.

Figure 6-12. AM1705 EMIFA Connection Diagram: Multiple NAND Flash Planes

6.10.3 External Memory Interface A (EMIFA) Registers

Table 6-17 is a list of the EMIF registers.

Table 6-17. External Memory Interface (EMIFA) Registers

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x6800 0000	MIDR	Module ID Register
0x6800 0004	AWCC	Asynchronous Wait Cycle Configuration Register

6.10.4 EMIFA Electrical Data/Timing

The following assume testing over recommended operating conditions.

Table 6-18. EMIFA Asynchronous Memory Timing Requirements⁽¹⁾

No.	PARAMETER		MIN	NOM	MAX	UNIT
READS and WRITES						
E	t _c (CLK)	Cycle time, EMIFA module clock	10			ns
2	t _w (EM_WAIT)	Pulse duration, EM_WAIT assertion and deassertion	2E			ns
READS						
12	t _{su} (EMDV-EMOEH)	Setup time, EM_D[15:0] valid before $\overline{\text{EM_OE}}$ high	3			ns
13	t _h (EMOEH-EMDIV)	Hold time, EM_D[15:0] valid after $\overline{\text{EM_OE}}$ high	0			ns
14	t _{su} (EMOEL-EMWAIT)	Setup Time, EM_WAIT asserted before end of Strobe Phase ⁽²⁾	4E+3			ns
WRITES						
28	t _{su} (EMWEL-EMWAIT)	Setup Time, EM_WAIT asserted before end of Strobe Phase ⁽²⁾	4E+3			ns

- (1) E = EMA_CLK period or in ns. EMA_CLK is selected either as SYSCLK3 or the PLL output clock divided by 4.5. As an example, when SYSCLK3 is selected and set to 100MHz, E=10ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. Figure 6-15 and Figure 6-16 describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-19. EMIFA Asynchronous Memory Switching Characteristics^{(1) (2) (3)}

No.	PARAMETER		MIN	NOM	MAX	UNIT
READS and WRITES						
1	t _d (TURNAROUND)	Turn around time	(TA)*E - 3	(TA)*E	(TA)*E + 3	ns
READS						
3	t _c (EMRCYCLE)	EMIF read cycle time (EW = 0)	(RS+RST+RH)*E - 3	(RS+RST+RH)*E	(RS+RST+RH)*E + 3	ns
		EMIF read cycle time (EW = 1)	(RS+RST+RH+E WC)*E - 3	(RS+RST+RH+EWC) *E	(RS+RST+RH+E WC)*E + 3	ns
4	t _{su} (EMCEL-EMOEL)	Output setup time, $\overline{\text{EMA_CE}}[5:2]$ low to $\overline{\text{EMA_OE}}$ low (SS = 0)	(RS)*E-3	(RS)*E	(RS)*E+3	ns
		Output setup time, $\overline{\text{EMA_CE}}[5:2]$ low to $\overline{\text{EMA_OE}}$ low (SS = 1)	-3	0	+3	ns
5	t _h (EMOEH-EMCEH)	Output hold time, $\overline{\text{EMA_OE}}$ high to $\overline{\text{EMA_CE}}[5:2]$ high (SS = 0)	(RH)*E - 3	(RH)*E	(RH)*E + 3	ns
		Output hold time, $\overline{\text{EMA_OE}}$ high to $\overline{\text{EMA_CE}}[5:2]$ high (SS = 1)	-3	0	+3	ns
6	t _{su} (EMBAV-EMOEL)	Output setup time, $\overline{\text{EMA_BA}}[1:0]$ valid to $\overline{\text{EMA_OE}}$ low	(RS)*E-3	(RS)*E	(RS)*E+3	ns
7	t _h (EMOEH-EMBAIV)	Output hold time, $\overline{\text{EMA_OE}}$ high to $\overline{\text{EMA_BA}}[1:0]$ invalid	(RH)*E-3	(RH)*E	(RH)*E+3	ns
8	t _{su} (EMBAV-EMOEL)	Output setup time, $\overline{\text{EMA_A}}[13:0]$ valid to $\overline{\text{EMA_OE}}$ low	(RS)*E-3	(RS)*E	(RS)*E+3	ns
9	t _h (EMOEH-EMAIV)	Output hold time, $\overline{\text{EMA_OE}}$ high to $\overline{\text{EMA_A}}[13:0]$ invalid	(RH)*E-3	(RH)*E	(RH)*E+3	ns
10	t _w (EMOEL)	$\overline{\text{EMA_OE}}$ active low width (EW = 0)	(RST)*E-3	(RST)*E	(RST)*E+3	ns
		$\overline{\text{EMA_OE}}$ active low width (EW = 1)	(RST+EWC)*E-3	(RST+EWC)*E	(RST+EWC)*E+ 3	ns

- (1) TA = Turn around, RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold, MEWC = Maximum external wait cycles. These parameters are programmed via the Asynchronous Bank and Asynchronous Wait Cycle Configuration Registers. These support the following range of values: TA[4-1], RS[16-1], RST[64-1], RH[8-1], WS[16-1], WST[64-1], WH[8-1], and MEW[1-256].
- (2) E = EMA_CLK period or in ns. EMA_CLK is selected either as SYSCLK3 or the PLL output clock divided by 4.5. As an example, when SYSCLK3 is selected and set to 100MHz, E=10ns.
- (3) EWC = external wait cycles determined by EMA_WAIT input signal. EWC supports the following range of values EWC[256-1]. Note that the maximum wait time before timeout is specified by bit field MEWC in the Asynchronous Wait Cycle Configuration Register.

Figure 6-15. EMA_WAIT Read Timing Requirements

Figure 6-16. EMA_WAIT Write Timing Requirements

6.11 External Memory Interface B (EMIFB)

The following EMIFB Functional Block Diagram illustrates a high-level view of the EMIFB and its connections within the device. Multiple requesters have access to EMIFB through a switched central resource (indicated as an overbar in the figure). The EMIFB implements a split transaction internal bus, allowing concurrence between reads and writes from the various requesters.

Figure 6-17. EMIFB Functional Block Diagram

EMIFB supports a 3.3V LVCMOS Interface.

6.11.1 EMIFB SDRAM Loading Limitations

EMIFB supports SDRAM up to 152 MHz with up to two SDRAM or asynchronous memory loads. Additional loads will limit the SDRAM operation to lower speeds and the maximum speed should be confirmed by board simulation using IBIS models.

6.11.2 Interfacing to SDRAM

The EMIFB supports a glueless interface to SDRAM devices with the following characteristics:

- Pre-charge bit is A[10]
- Supports 8, 9, 10 or 11 column address bits
- Supports up to 13 row address bits
- Supports 1, 2 or 4 internal banks

Table 6-20 shows the supported SDRAM configurations for EMIFB.

Table 6-20. EMIFB Supported SDRAM Configurations⁽¹⁾

SDRAM Memory Data Bus Width (bits)	Number of Memories	EMIFB Data Bus Size	Rows	Columns	Banks	Total Memory (Mbits)	Total Memory (Mbytes)	Memory Density (Mbits)
16	1	16	13	8	1	32	4	32
	1	16	13	8	2	64	8	64
	1	16	13	8	4	128	16	128
	1	16	13	9	1	64	8	64
	1	16	13	9	2	128	16	128
	1	16	13	9	4	256	32	256
	1	16	13	10	1	128	16	128
	1	16	13	10	2	256	32	256
	1	16	13	10	4	512	64	512
	1	16	13	11	1	256	32	256
	1	16	13	11	2	512	64	512
	1	16	13	11	4	1024	128	1024
8	2	16	13	8	1	32	4	16
	2	16	13	8	2	64	8	32
	2	16	13	8	4	128	16	64
	2	16	13	9	1	64	8	32

	2	16	13	10	1	128	16	64
	2	16	13	10	2	256	32	128
	2	16	13	10	4	512	64	256
	2	16	13	11	1	256	32	128
	2	16	13	11	2	512	64	256
	2	16	13	11	4	1024	128	512

(1) The shaded cells indicate configurations that are possible on the EMIFA interface but as of this writing SDRAM memories capable of supporting these densities are not available in the market.

Figure 6-18 shows an interface between the EMIFB and a 2M × 16 × 4 bank SDRAM device. Refer to Table 6-21, as an example that shows additional list of commonly-supported SDRAM devices and the required connections for the address pins. Note that in Table 6-21, page size/column size (not indicated in the table) is varied to get the required addressability range.

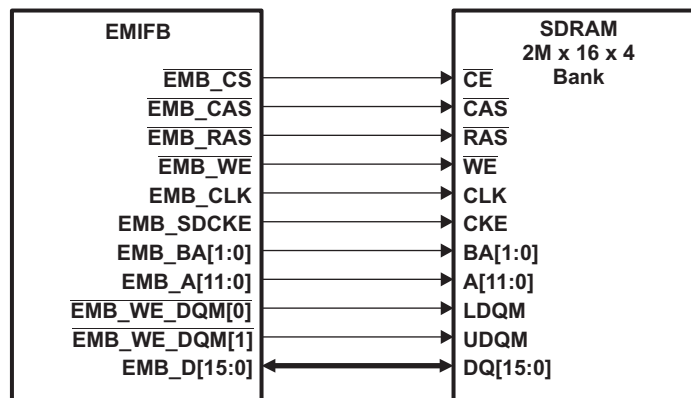

Figure 6-18. EMIFB to 2M × 16 × 4 bank SDRAM Interface

Table 6-21. Example of 16-bit EMIFB Address Pin Connections

SDRAM Size	Width	Banks		Address Pins
64M bits	×16	4	SDRAM	A[11:0]
			EMIFB	EMB_A[11:0]
128M bits	×16	4	SDRAM	A[11:0]
			EMIFB	EMB_A[11:0]
256M bits	×16	4	SDRAM	A[12:0]
			EMIFB	EMB_A[12:0]

Figure 6-19. EMIFB Basic SDRAM Write Operation

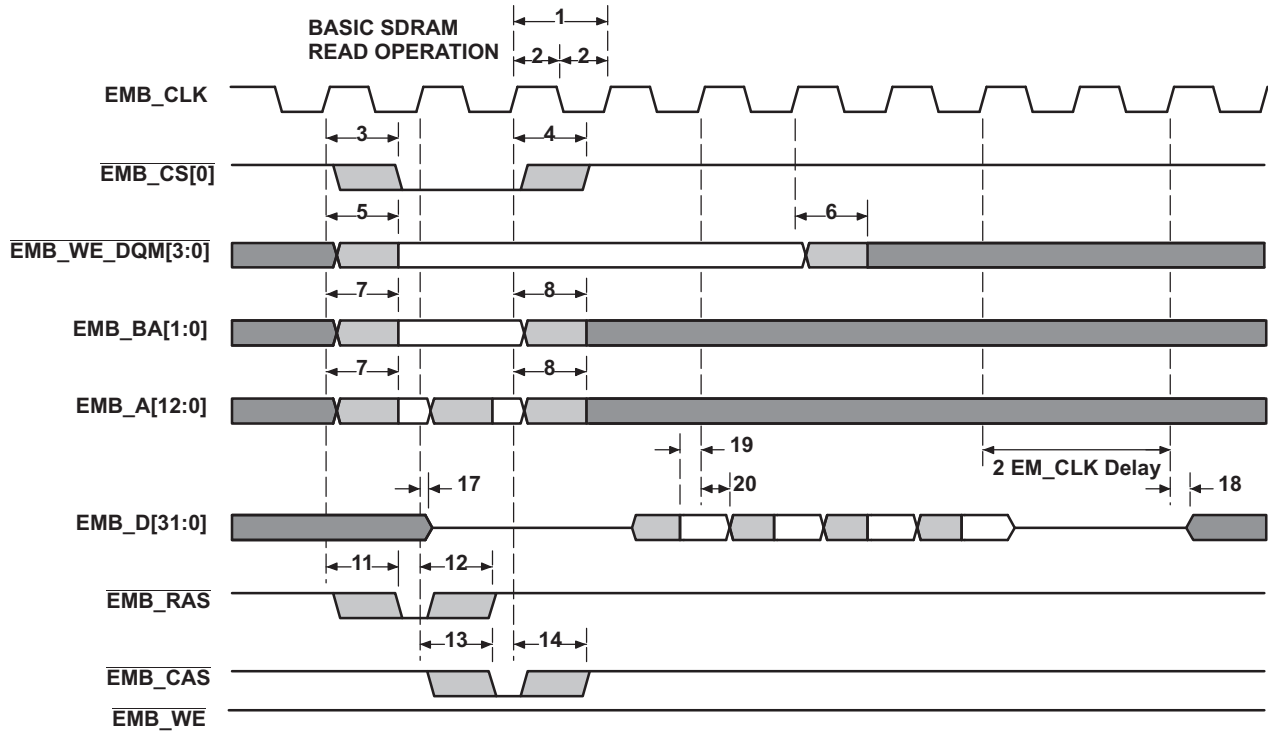

Figure 6-20. EMIFB Basic SDRAM Read Operation

6.12 Memory Protection Units

The MPU performs memory protection checking. It receives requests from a bus master in the system and checks the address against the fixed and programmable regions to see if the access is allowed. If allowed, the transfer is passed unmodified to its output bus (to the targeted address). If the transfer is illegal (fails the protection check) then the MPU does not pass the transfer to the output bus but rather services the transfer internally back to the input bus (to prevent a hang) returning the fault status to the requestor as well as generating an interrupt about the fault. The following features are supported by the MPU:

- Provides memory protection for fixed and programmable address ranges
- Supports multiple programmable address region
- Supports secure and debug access privileges
- Supports read, write, and execute access privileges
- Supports privid(8) associations with ranges
- Generates an interrupt when there is a protection violation, and saves violating transfer parameters
- MMR access is also protected

6.13 MMC / SD / SDIO (MMCSDB)

6.13.1 MMCSDB Peripheral Description

The device includes an MMCSDB controller which is compliant with MMC V4.0, Secure Digital Part 1 Physical Layer Specification V1.1 and Secure Digital Input Output (SDIO) V2.0 specifications.

The MMC/SD Controller has following features:

- MultiMediaCard (MMC) support
- Secure Digital (SD) Memory Card support
- MMC/SD protocol support
- SD high capacity support
- SDIO protocol support
- Programmable clock frequency
- 512 bit Read/Write FIFO to lower system overhead
- Slave EDMA transfer capability

The device MMC/SD Controller does not support SPI mode.

6.14 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the device and the network. The EMAC supports both 10Base-T and 100Base-TX, or 10 Mbps/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QoS) support.

The EMAC controls the flow of packet data from the device to the PHY. The MDIO module controls PHY configuration and status monitoring.

Both the EMAC and the MDIO modules interface to the device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

6.14.1 EMAC Peripheral Register Description(s)

Table 6-31. Ethernet Media Access Controller (EMAC) Registers

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01E2 3000	TXREV	Transmit Revision Register

No.	PARAMETER		MIN	TYP	MAX	UNIT
4	td(REFCLK-TXD)	Output Delay Time, RMII_MHZ_50_CLK High to TXD Valid	2.5		13	ns
5	td(REFCLK-TXEN)	Output Delay Time, RMII_MHZ_50_CLK High to TXEN Valid	2.5		13	ns

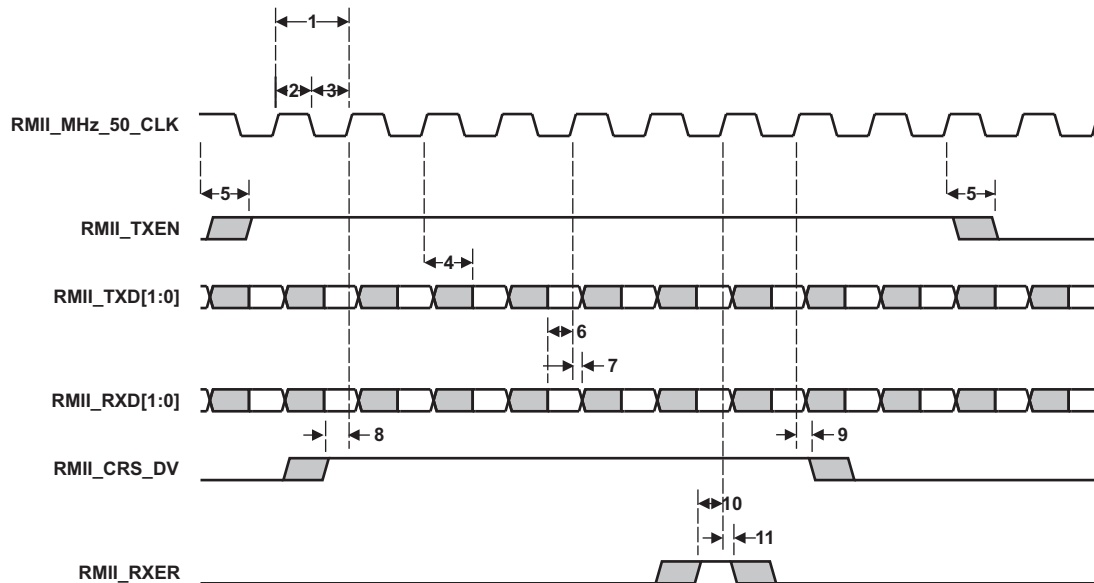

Figure 6-25. RMII Timing Diagram

6.15 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time.

6.15.1 MDIO Registers

For a list of supported MDIO registers see [Table 6-37](#) [MDIO Registers].

Table 6-37. MDIO Register Memory Map

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01E2 4000	REV	Revision Identification Register
0x01E2 4004	CONTROL	MDIO Control Register

0x01E2 4090 - 0x01E2 47FF	–	Reserved

6.15.2 Management Data Input/Output (MDIO) Electrical Data/Timing

Table 6-38. Timing Requirements for MDIO Input (see Figure 6-26 and Figure 6-27)

No.	PARAMETER	MIN	MAX	UNIT
1	$t_c(\text{MDIO_CLK})$ Cycle time, MDIO_CLK	400		ns
2	$t_w(\text{MDIO_CLK})$ Pulse duration, MDIO_CLK high/low	180		ns
3	$t_t(\text{MDIO_CLK})$ Transition time, MDIO_CLK		5	ns
4	$t_{su}(\text{MDIO-MDIO_CLKH})$ Setup time, MDIO_D data input valid before MDIO_CLK high	10		ns
5	$t_h(\text{MDIO_CLKH-MDIO})$ Hold time, MDIO_D data input valid after MDIO_CLK high	0		ns

Figure 6-26. MDIO Input Timing

Table 6-39. Switching Characteristics Over Recommended Operating Conditions for MDIO Output (see Figure 6-27)

No.	PARAMETER	MIN	MAX	UNIT
7	$t_d(\text{MDIO_CLKL-MDIO})$ Delay time, MDIO_CLK low to MDIO_D data output valid	0	100	ns

Figure 6-27. MDIO Output Timing

6.16 Multichannel Audio Serial Ports (McASP0, McASP1)

The McASP serial port is specifically designed for multichannel audio applications. Its key features are:

- Flexible clock and frame sync generation logic and on-chip dividers
- Up to sixteen transmit or receive data pins and serializers
- Large number of serial data format options, including:
 - TDM Frames with 2 to 32 time slots per frame (periodic) or 1 slot per frame (burst)
 - Time slots of 8, 12, 16, 20, 24, 28, and 32 bits
 - First bit delay 0, 1, or 2 clocks
 - MSB or LSB first bit order
 - Left- or right-aligned data words within time slots
- DIT Mode (optional) with 384-bit Channel Status and 384-bit User Data registers
- Extensive error checking and mute generation logic
- All unused pins GPIO-capable
- Transmit & Receive FIFO Buffers for each McASP. Allows the McASP to operate at a higher sample rate by making it more tolerant to DMA latency.
- Dynamic Adjustment of Clock Dividers
 - Clock Divider Value may be changed without resetting the McASP

The McASPs on the device are configured with the following options:

Table 6-40. McASP Configurations⁽¹⁾

Module	Serializers	AFIFO	DIT	Pins
McASP0	16	64 Word RX 64 Word TX	N	AXR0[13:0], AHCLKR0, ACLKR0, AFSR0, AHCLKX0, ACLKX0, AFSX0
McASP1	12	64 Word RX 64 Word TX	N	AXR1[11:10], AXR1[8:0], ACLKR1, AFSR1, AHCLKX1, ACLKX1, AFSX1, AMUTE1

(1) Pins available are the maximum number of pins that may be configured for a particular McASP; not including pin multiplexing.

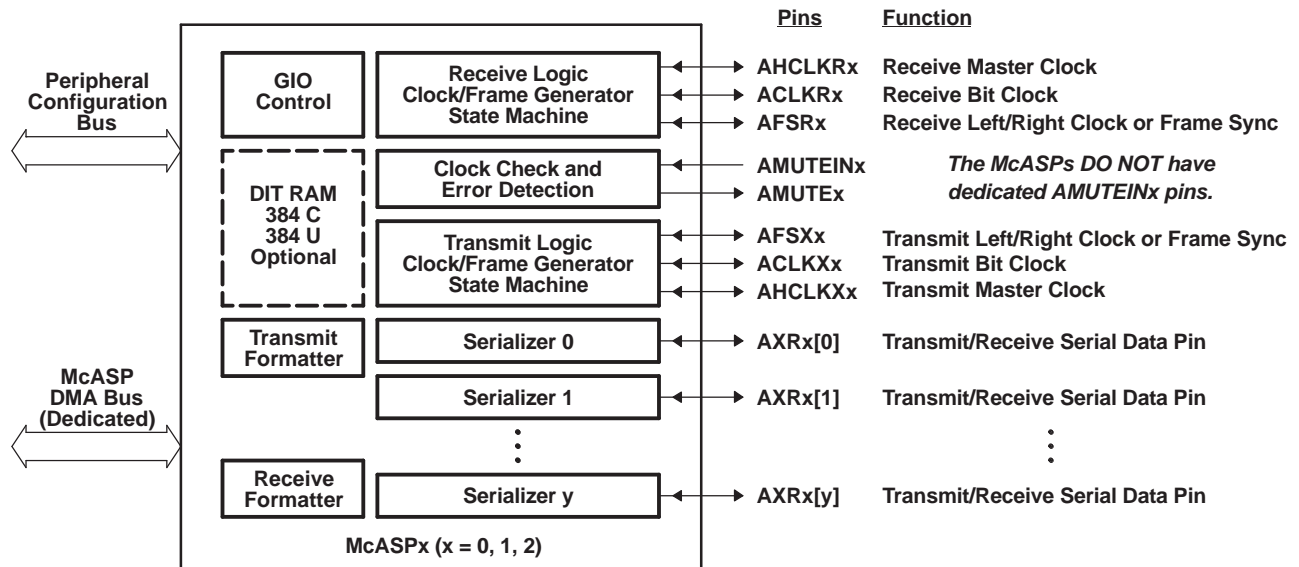

Figure 6-28. McASP Block Diagram

6.16.1 McASP Peripheral Registers Description(s)

Registers for the McASP are summarized in [Table 6-41](#). The registers are accessed through the peripheral configuration port. The receive buffer registers (RBUF) and transmit buffer registers (XBUF) can also be accessed through the DMA port, as listed in [Table 6-42](#).

Registers for the McASP Audio FIFO (AFIFO) are summarized in [Table 6-43](#). Note that the AFIFO Write FIFO (WFIFO) and Read FIFO (RFIFO) have independent control and status registers. The AFIFO control registers are accessed through the peripheral configuration port.

Table 6-41. McASP Registers Accessed Through Peripheral Configuration Port

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01D0 0000	0x01D0 4000	REV	Revision identification register
0x01D0 0010	0x01D0 4010	PFUNC	Pin function register

0x01D0 02B8	0x01D0 42B8	RBUF14 ⁽²⁾	Receive buffer register for serializer 14
0x01D0 02BC	0x01D0 42BC	RBUF15 ⁽²⁾	Receive buffer register for serializer 15

(2) Reads from XRBUF originate on peripheral configuration port only when RBUSEL = 1 in RFMT.

Table 6-42. McASP Registers Accessed Through DMA Port

	McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
Read Accesses	01D0 2000	01D0 6000	RBUF	Receive buffer DMA port address. Cycles through receive serializers, skipping over transmit serializers and inactive serializers. Starts at the lowest serializer at the beginning of each time slot. Reads from DMA port only if RBUSEL = 0 in RFMT.
Write Accesses	01D0 2000	01D0 6000	XBUF	Transmit buffer DMA port address. Cycles through transmit serializers, skipping over receive and inactive serializers. Starts at the lowest serializer at the beginning of each time slot. Writes to DMA port only if XBUSEL = 0 in XFMT.

Table 6-43. McASP AFIFO Registers Accessed Through Peripheral Configuration Port

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01D0 1000	0x01D0 5000	AFIFOREV	AFIFO revision identification register
0x01D0 1010	0x01D0 5010	WFIFOCTL	Write FIFO control register
0x01D0 1014	0x01D0 5014	WFIFOSTS	Write FIFO status register
0x01D0 1018	0x01D0 5018	RFIFOCTL	Read FIFO control register
0x01D0 101C	0x01D0 501C	RFIFOSTS	Read FIFO status register

(6) AX - ACLKX1 period.

(7) McASP1 ACLKXCTL.ASYNC=1: Receiver is clocked by its own ACLKR1

- A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).
- B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 6-29. McASP Input Timings

- A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 6-30. McASP Output Timings

6.17 Serial Peripheral Interface Ports (SPI0, SPI1)

Figure 6-31 is a block diagram of the SPI module, which is a simple shift register and buffer plus control logic. Data is written to the shift register before transmission occurs and is read from the buffer at the end of transmission. The SPI can operate either as a master, in which case, it initiates a transfer and drives the SPIx_CLK pin, or as a slave. Four clock phase and polarity options are supported as well as many data formatting options.

Figure 6-31. Block Diagram of SPI Module

The SPI supports 3-, 4-, and 5-pin operation with three basic pins (SPIx_CLK, SPIx_SIMO, and SPIx_SOMI) and two optional pins (SPIx_SCS, SPIx_ENA).

The optional $\overline{\text{SPIx_SCS}}$ (Slave Chip Select) pin is most useful to enable in slave mode when there are other slave devices on the same SPI port. The device will only shift data and drive the SPIx_SOMI pin when $\overline{\text{SPIx_SCS}}$ is held low.

In slave mode, $\overline{\text{SPIx_ENA}}$ is an optional output. The $\overline{\text{SPIx_ENA}}$ output provides the status of the internal transmit buffer (SPIDAT0/1 registers). In four-pin mode with the enable option, $\overline{\text{SPIx_ENA}}$ is asserted only when the transmit buffer is full, indicating that the slave is ready to begin another transfer. In five-pin mode, the $\overline{\text{SPIx_ENA}}$ is additionally qualified by $\overline{\text{SPIx_SCS}}$ being asserted. This allows a single handshake line to be shared by multiple slaves on the same SPI bus.

In master mode, the $\overline{\text{SPIx_ENA}}$ pin is an optional input and the master can be configured to delay the start of the next transfer until the slave asserts $\overline{\text{SPIx_ENA}}$. The addition of this handshake signal simplifies SPI communications and, on average, increases SPI bus throughput since the master does not need to delay each transfer long enough to allow for the worst-case latency of the slave device. Instead, each transfer can begin as soon as both the master and slave have actually serviced the previous SPI transfer.

Although the SPI module supports two interrupt outputs, SPIx_INT1 is the only interrupt connected on this device.

Figure 6-32. Illustration of SPI Master-to-SPI Slave Connection

6.17.1 SPI Peripheral Registers Description(s)

Table 6-48 is a list of the SPI registers.

Table 6-48. SPIx Configuration Registers

			Polarity = 0, Phase = 1, from $SPI1_CLK$ falling	P - 3	
			Polarity = 1, Phase = 0, from $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + P - 3$	
			Polarity = 1, Phase = 1, from $SPI1_CLK$ rising	P - 3	

(1) These parameters are in addition to the general timings for SPI master modes (Table 6-57).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.

(4) In the case where the master SPI is ready with new data before $\overline{SPI1_SCS}$ assertion.

(5) This delay can be increased under software control by the register bit field SPIDELAY.C2TDELAY[4:0].

(6) Except for modes when SPIDAT1.CSHOLD is enabled and there is additional data to transmit. In this case, $\overline{SPI1_SCS}$ will remain asserted.

(7) This delay can be increased under software control by the register bit field SPIDELAY.T2CDELAY[4:0].

Table 6-61. Additional⁽¹⁾ SPI1 Master Timings, 5-Pin Option^{(2) (3)}

No.	PARAMETER		MIN	MAX	UNIT
18	$t_{d(SPC_ENA)M}$	Max delay for slave to deassert $\overline{SPI1_ENA}$ after final $SPI1_CLK$ edge to ensure master does not begin the next transfer. ⁽⁴⁾	Polarity = 0, Phase = 0, from $SPI1_CLK$ falling	$0.5t_{c(SPC)M} + P + 5$	ns
			Polarity = 0, Phase = 1, from $SPI1_CLK$ falling	P + 5	
			Polarity = 1, Phase = 0, from $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + P + 5$	
			Polarity = 1, Phase = 1, from $SPI1_CLK$ rising	P + 5	
20	$t_{d(SPC_SCS)M}$	Delay from final $SPI1_CLK$ edge to master deasserting $\overline{SPI1_SCS}$ ^{(5) (6)}	Polarity = 0, Phase = 0, from $SPI1_CLK$ falling	$0.5t_{c(SPC)M} + P - 3$	ns
			Polarity = 0, Phase = 1, from $SPI1_CLK$ falling	P - 3	
			Polarity = 1, Phase = 0, from $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + P - 3$	
			Polarity = 1, Phase = 1, from $SPI1_CLK$ rising	P - 3	
21	$t_{d(SCSL_ENAL)M}$	Max delay for slave SPI to drive $\overline{SPI1_ENA}$ valid after master asserts $\overline{SPI1_SCS}$ to delay the master from beginning the next transfer.		C2TDELAY + P	ns

(1) These parameters are in addition to the general timings for SPI master modes (Table 6-58).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.

(4) In the case where the master SPI is ready with new data before $\overline{SPI1_ENA}$ deassertion.

(5) Except for modes when SPIDAT1.CSHOLD is enabled and there is additional data to transmit. In this case, $\overline{SPI1_SCS}$ will remain asserted.

(6) This delay can be increased under software control by the register bit field SPIDELAY.T2CDELAY[4:0].

Table 6-61. Additional⁽¹⁾ SPI1 Master Timings, 5-Pin Option^{(2) (3)} (continued)

No.	PARAMETER		MIN	MAX	UNIT
22	$t_{d(SCS_SPC)M}$	Delay from $\overline{SPI1_SCS}$ active to first $SPI1_CLK$ ^{(7) (8) (9)}	Polarity = 0, Phase = 0, to $SPI1_CLK$ rising	2P - 5	ns
			Polarity = 0, Phase = 1, to $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + 2P - 5$	
			Polarity = 1, Phase = 0, to $SPI1_CLK$ falling	2P - 5	
			Polarity = 1, Phase = 1, to $SPI1_CLK$ falling	$0.5t_{c(SPC)M} + 2P - 5$	
23	$t_{d(ENA_SPC)M}$	Delay from assertion of $\overline{SPI1_ENA}$ low to first $SPI1_CLK$ edge. ⁽¹⁰⁾	Polarity = 0, Phase = 0, to $SPI1_CLK$ rising	3P + 3	ns
			Polarity = 0, Phase = 1, to $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + 3P + 3$	
			Polarity = 1, Phase = 0, to $SPI1_CLK$ falling	3P + 3	
			Polarity = 1, Phase = 1, to $SPI1_CLK$ falling	$0.5t_{c(SPC)M} + 3P + 3$	

(7) If $\overline{SPI1_ENA}$ is asserted immediately such that the transmission is not delayed by $\overline{SPI1_ENA}$.

(8) In the case where the master SPI is ready with new data before $\overline{SPI1_SCS}$ assertion.

(9) This delay can be increased under software control by the register bit field $SPIDELAY.C2TDELAY[4:0]$.

(10) If $\overline{SPI1_ENA}$ was initially deasserted high and $SPI1_CLK$ is delayed.

Table 6-62. Additional⁽¹⁾ SPI1 Slave Timings, 4-Pin Enable Option^{(2) (3)}

No.	PARAMETER		MIN	MAX	UNIT	
24	$t_{d(SPC_ENAH)S}$	Delay from final $SPI1_CLK$ edge to slave deasserting $\overline{SPI1_ENA}$.	Polarity = 0, Phase = 0, from $SPI1_CLK$ falling	1.5 P - 3	2.5 P + 19	ns
			Polarity = 0, Phase = 1, from $SPI1_CLK$ falling	$-0.5t_{c(SPC)M} + 1.5 P - 3$	$-0.5t_{c(SPC)M} + 2.5 P + 19$	
			Polarity = 1, Phase = 0, from $SPI1_CLK$ rising	1.5 P - 3	2.5 P + 19	
			Polarity = 1, Phase = 1, from $SPI1_CLK$ rising	$-0.5t_{c(SPC)M} + 1.5 P - 3$	$-0.5t_{c(SPC)M} + 2.5 P + 19$	

(1) These parameters are in addition to the general timings for SPI slave modes (Table 6-58).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.

Table 6-63. Additional⁽¹⁾ SPI1 Slave Timings, 4-Pin Chip Select Option^{(2) (3)}

No.	PARAMETER		MIN	MAX	UNIT

26	$t_{d(SPC_SCSH)S}$	Required delay from final $SPI1_CLK$ edge before $\overline{SPI1_SCS}$ is deasserted.	Polarity = 0, Phase = 0, from $SPI1_CLK$ falling	$0.5t_{c(SPC)M} + P + 5$	ns
			Polarity = 0, Phase = 1, from $SPI1_CLK$ falling	P + 5	
			Polarity = 1, Phase = 0, from $SPI1_CLK$ rising	$0.5t_{c(SPC)M} + P + 5$	
			Polarity = 1, Phase = 1, from $SPI1_CLK$ rising	P + 5	
27	$t_{ena(SCSL_SOMI)S}$	Delay from master asserting $\overline{SPI1_SCS}$ to slave driving $SPI1_SOMI$ valid		P + 19	ns
28	$t_{dis(SCSH_SOMI)S}$	Delay from master deasserting $\overline{SPI1_SCS}$ to slave 3-stating $SPI1_SOMI$		P + 19	ns

(1) These parameters are in addition to the general timings for SPI slave modes (Table 6-58).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.

Table 6-64. Additional⁽¹⁾ SPI1 Slave Timings, 5-Pin Option⁽²⁾ ⁽³⁾

No.	PARAMETER		MIN	MAX	UNIT
25	$t_{d(SCSL_SPC)S}$	Required delay from $\overline{SPI1_SCS}$ asserted at slave to first SPI1_CLK edge at slave.	2P		ns
26	$t_{d(SPC_SCSH)S}$	Required delay from final SPI1_CLK edge before $\overline{SPI1_SCS}$ is deasserted.	Polarity = 0, Phase = 0, from SPI1_CLK falling	$0.5t_{c(SPC)M} + P + 5$	ns
			Polarity = 0, Phase = 1, from SPI1_CLK falling	P + 5	
			Polarity = 1, Phase = 0, from SPI1_CLK rising	$0.5t_{c(SPC)M} + P + 5$	
			Polarity = 1, Phase = 1, from SPI1_CLK rising	P + 5	
27	$t_{ena(SCSL_SOMI)S}$	Delay from master asserting $\overline{SPI1_SCS}$ to slave driving SPI1_SOMI valid	P + 19		ns
28	$t_{dis(SCSH_SOMI)S}$	Delay from master deasserting $\overline{SPI1_SCS}$ to slave 3-stating SPI1_SOMI	P + 19		ns
29	$t_{ena(SCSL_ENA)S}$	Delay from master deasserting $\overline{SPI1_SCS}$ to slave driving SPI1_ENA valid	19		ns
30	$t_{dis(SPC_ENA)S}$	Delay from final clock receive edge on SPI1_CLK to slave 3-stating or driving high SPI1_ENA. ⁽⁴⁾	Polarity = 0, Phase = 0, from SPI1_CLK falling	2.5 P + 19	ns
			Polarity = 0, Phase = 1, from SPI1_CLK rising	2.5 P + 19	
			Polarity = 1, Phase = 0, from SPI1_CLK rising	2.5 P + 19	
			Polarity = 1, Phase = 1, from SPI1_CLK falling	2.5 P + 19	

(1) These parameters are in addition to the general timings for SPI slave modes (Table 6-58).

(2) P = SYSCLK2 period

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.

(4) SPI1_ENA is driven low after the transmission completes if the SPIINT0.ENABLE_HIGHZ bit is programmed to 0. Otherwise it is 3-stated. If 3-stated, an external pullup resistor should be used to provide a valid level to the master. This option is useful when tying several SPI slave devices to a single master.

6.18 Enhanced Capture (eCAP) Peripheral

The device contains up to three enhanced capture (eCAP) modules. [Figure 6-37](#) shows a functional block diagram of a module.

Uses for ECAP include:

- Speed measurements of rotating machinery (e.g. toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor triggers
- Period and duty cycle measurements of Pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

The ECAP module described in this specification includes the following features:

- 32 bit time base
- 4 event time-stamp registers (each 32 bits)
- Edge polarity selection for up to 4 sequenced time-stamp capture events
- Interrupt on either of the 4 events
- Single shot capture of up to 4 event time-stamps
- Continuous mode capture of time-stamps in a 4 deep circular buffer
- Absolute time-stamp capture
- Difference mode time-stamp capture
- All the above resources are dedicated to a single input pin

The eCAP modules are clocked at the SYSCLK2 rate.

Figure 6-37. eCAP Functional Block Diagram

Table 6-65 is the list of the ECAP registers.

Table 6-65. ECAPx Configuration Registers

ECAP0 BYTE ADDRESS	ECAP1 BYTE ADDRESS	ECAP2 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION

6.20.1 Enhanced Pulse Width Modulator (eHRPWM) Timing

PWM refers to PWM outputs on eHRPWM1-6. Table 6-72 shows the PWM timing requirements and Table 6-73, switching characteristics.

Table 6-72. eHRPWM Timing Requirements

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(SYNCIN)}$ Sync input pulse width	Asynchronous	$2t_{c(SCO)}$		cycles
	Synchronous	$2t_{c(SCO)}$		cycles

Table 6-73. eHRPWM Switching Characteristics

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(PWM)}$ Pulse duration, PWMx output high/low		20		ns
$t_{w(SYNCOUT)}$ Sync output pulse width		$8t_{c(SCO)}$		cycles
$t_{d(PWM)TZA}$ Delay time, trip input active to PWM forced high Delay time, trip input active to PWM forced low	no pin load; no additional programmable delay		25	ns
	no additional programmable delay		20	ns

6.20.2 Trip-Zone Input Timing

- A. PWM refers to all the PWM pins in the device. The state of the PWM pins after \overline{TZ} is taken high depends on the PWM recovery software.

Figure 6-41. PWM Hi-Z Characteristics

Table 6-74. Trip-Zone input Timing Requirements

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(TZ)}$ Pulse duration, \overline{TZx} input low	Asynchronous	$1t_{c(SCO)}$		cycles
	Synchronous	$2t_{c(SCO)}$		cycles

Table 6-75 shows the high-resolution PWM switching characteristics.

Table 6-75. High Resolution PWM Characteristics at SYSCLKOUT = (60 - 100 MHz)

PARAMETER	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size ⁽¹⁾		200		ps

(1) MEP step size will increase with low voltage and high temperature and decrease with high voltage and cold temperature.

6.21 Timers

The timers support the following features:

- Configurable as single 64-bit timer or two 32-bit timers
- Period timeouts generate interrupts, DMA events or external pin events
- 8 32-bit compare registers
- Compare matches generate interrupt events
- Capture capability
- 64-bit Watchdog capability (Timer64P1 only)

[Table 6-76](#) lists the timer registers.

Table 6-76. Timer Registers

Timer64P 0	Timer64P 1	ACRONYM	REGISTER DESCRIPTION
0x01C2 0000	0x01C2 1000	REV	Revision Register
0x01C2 0004	0x01C2 1004	EMUMGT	Emulation Management Register
0x01C2 0008	0x01C2 1008	GPINTGPEN	GPIO Interrupt and GPIO Enable Register
0x01C2 000C	0x01C2 100C	GPDATGPDIR	GPIO Data and GPIO Direction Register

0x01C2 0068	0x01C2 1068	CMP2	Compare Register 2
0x01C2 006C	0x01C2 106C	CMP3	Compare Register 3
0x01C2 0070	0x01C2 1070	CMP4	Compare Register 4
0x01C2 0074	0x01C2 1074	CMP5	Compare Register 5
0x01C2 0078	0x01C2 1078	CMP6	Compare Register 6
0x01C2 007C	0x01C2 107C	CMP7	Compare Register 7

6.21.1 Timer Electrical Data/Timing

Table 6-77. Timing Requirements for Timer Input^{(1) (2)} (see Figure 6-42)

No.	PARAMETER	MIN	MAX	UNIT
1	$t_{c(TM64Px_IN12)}$ Cycle time, TM64Px_IN12	4P		ns
2	$t_{w(TINPH)}$ Pulse duration, TM64Px_IN12 high	0.45C	0.55C	ns
3	$t_{w(TINPL)}$ Pulse duration, TM64Px_IN12 low	0.45C	0.55C	ns
4	$t_t(TM64Px_IN12)$ Transition time, TM64Px_IN12		0.25P or 10 ⁽³⁾	ns

- (1) P = OSCIN cycle time in ns. For example, when OSCIN frequency is 27 MHz, use P = 37.037 ns.
- (2) C = TM64P0_IN12 cycle time in ns. For example, when TM64Px_IN12 frequency is 27 MHz, use C = 37.037 ns
- (3) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.

Figure 6-42. Timer Timing

Table 6-78. Switching Characteristics Over Recommended Operating Conditions for Timer Output⁽¹⁾

No.	PARAMETER	MIN	MAX	UNIT
5	$t_{w(TOUTH)}$ Pulse duration, TM64P0_OUT12 high	4P		ns
6	$t_{w(TOUTL)}$ Pulse duration, TM64P0_OUT12 low	4P		ns

- (1) P = OSCIN cycle time in ns. For example, when OSCIN frequency is 27 MHz, use P = 37.037 ns.

Figure 6-43. Timer Timing

6.22 Inter-Integrated Circuit Serial Ports (I2C0, I2C1)

6.22.1 I2C Device-Specific Information

Having two I2C modules on the device simplifies system architecture. Figure 6-44 is block diagram of the I2C Module.

Each I2C port supports:

- Compatible with Philips® I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- General-Purpose I/O Capability if not used as I2C

Figure 6-44. I2C Module Block Diagram

6.22.2 I2C Peripheral Registers Description(s)

Table 6-79 is the list of the I2C registers.

Table 6-79. Inter-Integrated Circuit (I2C) Registers

I2C0 BYTE ADDRESS	I2C1 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01C2 2000	0x01E2 8000	ICOAR	I2C Own Address Register
0x01C2 2004	0x01E2 8004	ICIMR	I2C Interrupt Mask Register
0x01C2 2008	0x01E2 8008	ICSTR	I2C Interrupt Status Register
0x01C2 200C	0x01E2 800C	ICCLKL	I2C Clock Low-Time Divider Register
0x01C2 2010	0x01E2 8010	ICCLKH	I2C Clock High-Time Divider Register
0x01C2 2014	0x01E2 8014	ICCNT	I2C Data Count Register
0x01C2 2018	0x01E2 8018	ICDRR	I2C Data Receive Register
0x01C2 201C	0x01E2 801C	ICSAR	I2C Slave Address Register

0x01C2 202C	0x01E2 802C	ICEMDR	I2C Extended Mode Register
0x01C2 2030	0x01E2 8030	ICPSC	I2C Prescaler Register
0x01C2 2034	0x01E2 8034	REVID1	I2C Revision Identification Register 1
0x01C2 2038	0x01E2 8038	REVID2	I2C Revision Identification Register 2
0x01C2 2048	0x01E2 8048	ICPFUNC	I2C Pin Function Register
0x01C2 204C	0x01E2 804C	ICPDIR	I2C Pin Direction Register
0x01C2 2050	0x01E2 8050	ICPDIN	I2C Pin Data In Register
0x01C2 2054	0x01E2 8054	ICPDOUT	I2C Pin Data Out Register
0x01C2 2058	0x01E2 8058	ICPDSET	I2C Pin Data Set Register
0x01C2 205C	0x01E2 805C	ICPDCLR	I2C Pin Data Clear Register

6.22.3 I2C Electrical Data/Timing

6.22.3.1 Inter-Integrated Circuit (I2C) Timing

Table 6-80 and Table 6-81 assume testing over recommended operating conditions (see Figure 6-45 and Figure 6-46).

Table 6-80. I2C Input Timing Requirements

No.	PARAMETER		MIN	MAX	UNIT	
1	$t_{c(SCL)}$	Cycle time, I2Cx_SCL	Standard Mode	10	μ s	
			Fast Mode	2.5		
2	$t_{su(SCLH-SDAL)}$	Setup time, I2Cx_SCL high before I2Cx_SDA low	Standard Mode	4.7	μ s	
			Fast Mode	0.6		
3	$t_{h(SCLL-SDAL)}$	Hold time, I2Cx_SCL low after I2Cx_SDA low	Standard Mode	4	μ s	
			Fast Mode	0.6		
4	$t_{w(SCLL)}$	Pulse duration, I2Cx_SCL low	Standard Mode	4.7	μ s	
			Fast Mode	1.3		
5	$t_{w(SCLH)}$	Pulse duration, I2Cx_SCL high	Standard Mode	4	μ s	
			Fast Mode	0.6		
6	$t_{su(SDA-SCLH)}$	Setup time, I2Cx_SDA before I2Cx_SCL high	Standard Mode	250	ns	
			Fast Mode	100		
7	$t_{h(SDA-SCLL)}$	Hold time, I2Cx_SDA after I2Cx_SCL low	Standard Mode	0	μ s	
			Fast Mode	0		0.9
8	$t_{w(SDAH)}$	Pulse duration, I2Cx_SDA high	Standard Mode	4.7	μ s	
			Fast Mode	1.3		
9	$t_{r(SDA)}$	Rise time, I2Cx_SDA	Standard Mode		1000	ns
			Fast Mode	$20 + 0.1C_b$	300	
10	$t_{r(SCL)}$	Rise time, I2Cx_SCL	Standard Mode		1000	ns
			Fast Mode	$20 + 0.1C_b$	300	
11	$t_{f(SDA)}$	Fall time, I2Cx_SDA	Standard Mode		300	ns
			Fast Mode	$20 + 0.1C_b$	300	
12	$t_{f(SCL)}$	Fall time, I2Cx_SCL	Standard Mode		300	ns
			Fast Mode	$20 + 0.1C_b$	300	
13	$t_{su(SCLH-SDAH)}$	Setup time, I2Cx_SCL high before I2Cx_SDA high	Standard Mode	4	μ s	
			Fast Mode	0.6		
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)	Standard Mode	N/A	ns	
			Fast Mode	0		50
15	C_b	Capacitive load for each bus line	Standard Mode		400	pF
			Fast Mode		400	

Table 6-81. I2C Switching Characteristics⁽¹⁾

No.	PARAMETER		MIN	MAX	UNIT
16	$t_{c(SCL)}$	Cycle time, I2Cx_SCL	Standard Mode	10	μs
			Fast Mode	2.5	
17	$t_{su(SCLH-SDAL)}$	Setup time, I2Cx_SCL high before I2Cx_SDA low	Standard Mode	4.7	μs
			Fast Mode	0.6	
18	$t_{h(SDAL-SCLL)}$	Hold time, I2Cx_SCL low after I2Cx_SDA low	Standard Mode	4	μs
			Fast Mode	0.6	
19	$t_{w(SCLL)}$	Pulse duration, I2Cx_SCL low	Standard Mode	4.7	μs
			Fast Mode	1.3	
20	$t_{w(SCLH)}$	Pulse duration, I2Cx_SCL high	Standard Mode	4	μs
			Fast Mode	0.6	
21	$t_{su(SDAV-SCLH)}$	Setup time, I2Cx_SDA valid before I2Cx_SCL high	Standard Mode	250	ns
			Fast Mode	100	
22	$t_{h(SCLL-SDAV)}$	Hold time, I2Cx_SDA valid after I2Cx_SCL low	Standard Mode	0	μs
			Fast Mode	0	
23	$t_{w(SDAH)}$	Pulse duration, I2Cx_SDA high	Standard Mode	4.7	μs
			Fast Mode	1.3	
28	$t_{su(SCLH-SDAH)}$	Setup time, I2Cx_SCL high before I2Cx_SDA high	Standard Mode	4	μs
			Fast Mode	0.6	

(1) I2C must be configured correctly to meet the timings in Table 6-81.

Figure 6-45. I2C Receive Timings

Figure 6-46. I2C Transmit Timings

6.23 Universal Asynchronous Receiver/Transmitter (UART)

The device has 3 UART peripherals. Each UART has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- Autoflow control signals (CTS, RTS) on UART0 only
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Programmable Baud Rate up to 3Mbaud
- Programmable Oversampling Options of x13 and x16
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
 - 5, 6, 7, or 8-bit characters
 - Even, odd, or no parity bit generation and detection
 - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
 - Loopback controls for communications link fault isolation
 - Break, parity, overrun, and framing error simulation

The UART registers are listed in [Section 6.23.1](#)

6.23.1 UART Peripheral Registers Description(s)

[Table 6-82](#) is the list of UART registers.

Table 6-82. UART Registers

UART0 BYTE ADDRESS	UART1 BYTE ADDRESS	UART2 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01C4 2000	0x01D0 C000	0x01D0 D000	RBR	Receiver Buffer Register (read only)
0x01C4 2000	0x01D0 C000	0x01D0 D000	THR	Transmitter Holding Register (write only)
0x01C4 2004	0x01D0 C004	0x01D0 D004	IER	Interrupt Enable Register
0x01C4 2008	0x01D0 C008	0x01D0 D008	IIR	Interrupt Identification Register (read only)
0x01C4 2008	0x01D0 C008	0x01D0 D008	FCR	FIFO Control Register (write only)
0x01C4 200C	0x01D0 C00C	0x01D0 D00C	LCR	Line Control Register
0x01C4 2010	0x01D0 C010	0x01D0 D010	MCR	Modem Control Register
0x01C4 2014	0x01D0 C014	0x01D0 D014	LSR	Line Status Register
0x01C4 2018	0x01D0 C018	0x01D0 D018	MSR	Modem Status Register
0x01C4 201C	0x01D0 C01C	0x01D0 D01C	SCR	Scratchpad Register
0x01C4 2020	0x01D0 C020	0x01D0 D020	DLL	Divisor LSB Latch
0x01C4 2024	0x01D0 C024	0x01D0 D024	DLH	Divisor MSB Latch
0x01C4 2028	0x01D0 C028	0x01D0 D028	REVID1	Revision Identification Register 1
0x01C4 2030	0x01D0 C030	0x01D0 D030	PWREMU_MGMT	Power and Emulation Management Register
0x01C4 2034	0x01D0 C034	0x01D0 D034	MDR	Mode Definition Register

6.23.2 UART Electrical Data/Timing

Table 6-83. Timing Requirements for UARTx Receive⁽¹⁾ (see Figure 6-47)

No.	PARAMETER	MIN	MAX	UNIT
4	$t_w(\text{URXDB})$ Pulse duration, receive data bit (RXDn)	0.96U	1.05U	ns
5	$t_w(\text{URXSB})$ Pulse duration, receive start bit	0.96U	1.05U	ns

(1) U = UART baud time = 1/programmed baud rate.

Table 6-84. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit⁽¹⁾ (see Figure 6-47)

No.	PARAMETER	MIN	MAX	UNIT
1	$f_{(\text{baud})}$ Maximum programmable baud rate		D/E ⁽²⁾ ⁽³⁾	MBaud ⁽⁴⁾
2	$t_w(\text{UTXDB})$ Pulse duration, transmit data bit (TXDn)	U - 2	U + 2	ns
3	$t_w(\text{UTXSB})$ Pulse duration, transmit start bit	U - 2	U + 2	ns

(1) U = UART baud time = 1/programmed baud rate.

(2) D = UART input clock in MHz. The UART(s) input clock source is PLL0_SYSCLK2.

(3) E = UART divisor x UART sampling rate. The UART divisor is set through the UART divisor latch registers (DLL and DLH). The UART sampling rate is set through the over-sampling mode select bit (OSM_SEL) of the UART mode definition register (MDR).

(4) Baud rate is not indicative of data rate. Actual data rate will be limited by system factors such as EDMA loading, EMIF loading, system frequency, etc.

Figure 6-47. UART Transmit/Receive Timing

6.24 USB0 OTG (USB2.0 OTG)

The device USB2.0 peripheral supports the following features:

- USB 2.0 peripheral at full-speed (FS: 12 Mb/s)
- USB 2.0 host at speeds FS, and low speed (LS: 1.5 Mb/s)
- All transfer modes (control, bulk, interrupt, and isochronous)
- 4 Transmit (TX) and 4 Receive (RX) endpoints in addition to endpoint 0
- FIFO RAM
 - 4K endpoint
 - Programmable size
- Integrated USB 2.0 PHY
- Connects to a standard Charge Pump for VBUS 5 V generation
- RNDIS mode for accelerating RNDIS type protocols using short packet termination over USB

Important Notice: On the original device pinout (marked "A" in the lower right corner of the package), pins USB0_VSSA33 (H4) and USB0_VSSA (F3) were connected to ground outside the package. For more robust ESD performance, the USB0 ground references are now connected inside the package on packages marked "B" and the package pins are unconnected. This change will require that any external filter circuits previously referenced to ground at these pins will need to reference the board ground instead.

Important Notice: The USB0 controller module clock (PLL0_SYSCLK2) must be greater than 30 MHz for proper operation of the USB controller. A clock rate of 60 MHz or greater is recommended to avoid data throughput reduction.

Table 6-85 is the list of USB OTG registers.

Table 6-85. Universal Serial Bus OTG (USB0) Registers

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01E0 0000	REVID	Revision Register
0x01E0 0004	CTRLR	Control Register
0x01E0 0008	STATR	Status Register
0x01E0 000C	EMUR	Emulation Register
0x01E0 0010	MODE	Mode Register
0x01E0 0014	AUTOREQ	Autorequest Register

0x01E0 005C	GENRNDISSZ4	Generic RNDIS Size EP4
0x01E0 0400	FADDR	Function Address Register
0x01E0 0401	POWER	Power Management Register
0x01E0 0402	INTRTX	Interrupt Register for Endpoint 0 plus Transmit Endpoints 1 to 4

Table 6-85. Universal Serial Bus OTG (USB0) Registers (continued)

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01E0 0404	INTRRX	Interrupt Register for Receive Endpoints 1 to 4
0x01E0 0406	INTRTXE	Interrupt Enable Register for INTRTX
0x01E0 0408	INTRRXE	Interrupt Enable Register for INTRRX
0x01E0 040A	INTRUSB	Interrupt Register for Common USB Interrupts
0x01E0 040B	INTRUSBE	Interrupt Enable Register for INTRUSB
0x01E0 040C	FRAME	Frame Number Register
0x01E0 040E	INDEX	Index Register for Selecting the Endpoint Status and Control Registers
0x01E0 040F	TESTMODE	Register to Enable the USB 2.0 Test Modes
INDEXED REGISTERS		
These registers operate on the endpoint selected by the INDEX register		
0x01E0 0410	TXMAXP	Maximum Packet Size for Peripheral/Host Transmit Endpoint (Index register set to select Endpoints 1-4 only)
0x01E0 0412	PERI_CSR0	Control Status Register for Endpoint 0 in Peripheral Mode. (Index register set to select Endpoint 0)
	HOST_CSR0	Control Status Register for Endpoint 0 in Host Mode. (Index register set to select Endpoint 0)
	PERI_TXCSR	Control Status Register for Peripheral Transmit Endpoint. (Index register set to select Endpoints 1-4)
	HOST_TXCSR	Control Status Register for Host Transmit Endpoint. (Index register set to select Endpoints 1-4)
0x01E0 0414	RXMAXP	Maximum Packet Size for Peripheral/Host Receive Endpoint (Index register set to select Endpoints 1-4 only)
0x01E0 0416	PERI_RXCSR	Control Status Register for Peripheral Receive Endpoint. (Index register set to select Endpoints 1-4)
	HOST_RXCSR	Control Status Register for Host Receive Endpoint. (Index register set to select Endpoints 1-4)
0x01E0 0418	COUNT0	Number of Received Bytes in Endpoint 0 FIFO. (Index register set to select Endpoint 0)
	RXCOUNT	Number of Bytes in Host Receive Endpoint FIFO. (Index register set to select Endpoints 1- 4)
0x01E0 041A	HOST_TYPE0	Defines the speed of Endpoint 0
	HOST_TXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Transmit endpoint. (Index register set to select Endpoints 1-4 only)
0x01E0 041B	HOST_NAKLIMIT0	Sets the NAK response timeout on Endpoint 0. (Index register set to select Endpoint 0)
	HOST_TXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Transmit endpoint. (Index register set to select Endpoints 1-4 only)
0x01E0 041C	HOST_RXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Receive endpoint. (Index register set to select Endpoints 1-4 only)
0x01E0 041D	HOST_RXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Receive endpoint. (Index register set to select Endpoints 1-4 only)
0x01E0 041F	CONFIGDATA	Returns details of core configuration. (Index register set to select Endpoint 0)
FIFO		
0x01E0 0420	FIFO0	Transmit and Receive FIFO Register for Endpoint 0
0x01E0 0424	FIFO1	Transmit and Receive FIFO Register for Endpoint 1
0x01E0 0428	FIFO2	Transmit and Receive FIFO Register for Endpoint 2
0x01E0 042C	FIFO3	Transmit and Receive FIFO Register for Endpoint 3
0x01E0 0430	FIFO4	Transmit and Receive FIFO Register for Endpoint 4

Table 6-85. Universal Serial Bus OTG (USB0) Registers (continued)

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
OTG DEVICE CONTROL		
0x01E0 0460	DEVCTL	Device Control Register
DYNAMIC FIFO CONTROL		
0x01E0 0462	TXFIFOSZ	Transmit Endpoint FIFO Size (Index register set to select Endpoints 1-4 only)
0x01E0 0463	RXFIFOSZ	Receive Endpoint FIFO Size (Index register set to select Endpoints 1-4 only)
0x01E0 0464	TXFIFOADDR	Transmit Endpoint FIFO Address (Index register set to select Endpoints 1-4 only)
0x01E0 0466	RXFIFOADDR	Receive Endpoint FIFO Address (Index register set to select Endpoints 1-4 only)
0x01E0 046C	HWVERS	Hardware Version Register
TARGET ENDPOINT 0 CONTROL REGISTERS, VALID ONLY IN HOST MODE		
0x01E0 0480	TXFUNCADDR	Address of the target function that has to be accessed through the associated Transmit Endpoint.
0x01E0 0482	TXHUBADDR	Address of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0483	TXHUBPORT	Port of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0484	RXFUNCADDR	Address of the target function that has to be accessed through the associated Receive Endpoint.
0x01E0 0486	RXHUBADDR	Address of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0487	RXHUBPORT	Port of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
TARGET ENDPOINT 1 CONTROL REGISTERS, VALID ONLY IN HOST MODE		
0x01E0 0488	TXFUNCADDR	Address of the target function that has to be accessed through the associated Transmit Endpoint.
0x01E0 048A	TXHUBADDR	Address of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 048B	TXHUBPORT	Port of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 048C	RXFUNCADDR	Address of the target function that has to be accessed through the associated Receive Endpoint.
0x01E0 048E	RXHUBADDR	Address of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 048F	RXHUBPORT	Port of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.

Table 6-85. Universal Serial Bus OTG (USB0) Registers (continued)

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
TARGET ENDPOINT 2 CONTROL REGISTERS, VALID ONLY IN HOST MODE		
0x01E0 0490	TXFUNCADDR	Address of the target function that has to be accessed through the associated Transmit Endpoint.
0x01E0 0492	TXHUBADDR	Address of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0493	TXHUBPORT	Port of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0494	RXFUNCADDR	Address of the target function that has to be accessed through the associated Receive Endpoint.
0x01E0 0496	RXHUBADDR	Address of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 0497	RXHUBPORT	Port of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
TARGET ENDPOINT 3 CONTROL REGISTERS, VALID ONLY IN HOST MODE		
0x01E0 0498	TXFUNCADDR	Address of the target function that has to be accessed through the associated Transmit Endpoint.
0x01E0 049A	TXHUBADDR	Address of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 049B	TXHUBPORT	Port of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 049C	RXFUNCADDR	Address of the target function that has to be accessed through the associated Receive Endpoint.
0x01E0 049E	RXHUBADDR	Address of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 049F	RXHUBPORT	Port of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
TARGET ENDPOINT 4 CONTROL REGISTERS, VALID ONLY IN HOST MODE		
0x01E0 04A0	TXFUNCADDR	Address of the target function that has to be accessed through the associated Transmit Endpoint.
0x01E0 04A2	TXHUBADDR	Address of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 04A3	TXHUBPORT	Port of the hub that has to be accessed through the associated Transmit Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 04A4	RXFUNCADDR	Address of the target function that has to be accessed through the associated Receive Endpoint.
0x01E0 04A6	RXHUBADDR	Address of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.
0x01E0 04A7	RXHUBPORT	Port of the hub that has to be accessed through the associated Receive Endpoint. This is used only when full speed or low speed device is connected via a USB2.0 high-speed hub.

Table 6-85. Universal Serial Bus OTG (USB0) Registers (continued)

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
CONTROL AND STATUS REGISTER FOR ENDPOINT 0		
0x01E0 0502	PERI_CSR0	Control Status Register for Endpoint 0 in Peripheral Mode
	HOST_CSR0	Control Status Register for Endpoint 0 in Host Mode
0x01E0 0508	COUNT0	Number of Received Bytes in Endpoint 0 FIFO
0x01E0 050A	HOST_TYPE0	Defines the Speed of Endpoint 0
0x01E0 050B	HOST_NAKLIMIT0	Sets the NAK Response Timeout on Endpoint 0
0x01E0 050F	CONFIGDATA	Returns details of core configuration.
CONTROL AND STATUS REGISTER FOR ENDPOINT 1		
0x01E0 0510	TXMAXP	Maximum Packet Size for Peripheral/Host Transmit Endpoint
0x01E0 0512	PERI_TXCSR	Control Status Register for Peripheral Transmit Endpoint (peripheral mode)
	HOST_TXCSR	Control Status Register for Host Transmit Endpoint (host mode)
0x01E0 0514	RXMAXP	Maximum Packet Size for Peripheral/Host Receive Endpoint
0x01E0 0516	PERI_RXCSR	Control Status Register for Peripheral Receive Endpoint (peripheral mode)
	HOST_RXCSR	Control Status Register for Host Receive Endpoint (host mode)
0x01E0 0518	RXCOUNT	Number of Bytes in Host Receive endpoint FIFO
0x01E0 051A	HOST_TXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Transmit endpoint.
0x01E0 051B	HOST_TXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Transmit endpoint.
0x01E0 051C	HOST_RXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Receive endpoint.
0x01E0 051D	HOST_RXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Receive endpoint.
CONTROL AND STATUS REGISTER FOR ENDPOINT 2		
0x01E0 0520	TXMAXP	Maximum Packet Size for Peripheral/Host Transmit Endpoint
0x01E0 0522	PERI_TXCSR	Control Status Register for Peripheral Transmit Endpoint (peripheral mode)
	HOST_TXCSR	Control Status Register for Host Transmit Endpoint (host mode)
0x01E0 0524	RXMAXP	Maximum Packet Size for Peripheral/Host Receive Endpoint
0x01E0 0526	PERI_RXCSR	Control Status Register for Peripheral Receive Endpoint (peripheral mode)
	HOST_RXCSR	Control Status Register for Host Receive Endpoint (host mode)
0x01E0 0528	RXCOUNT	Number of Bytes in Host Receive endpoint FIFO
0x01E0 052A	HOST_TXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Transmit endpoint.
0x01E0 052B	HOST_TXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Transmit endpoint.
0x01E0 052C	HOST_RXTYPE	Sets the operating speed, transaction protocol and peripheral endpoint number for the host Receive endpoint.
0x01E0 052D	HOST_RXINTERVAL	Sets the polling interval for Interrupt/ISOC transactions or the NAK response timeout on Bulk transactions for host Receive endpoint.

6.24.1 USB2.0 (USB0) Electrical Data/Timing

The USB PHY PLL can support input clock of the following frequencies: 12.0 MHz, 13.0 MHz, 19.2 MHz, 20.0 MHz, 24.0 MHz, 26.0 MHz, 38.4 MHz, 40.0 MHz or 48.0 MHz. USB_REFCLKIN jitter tolerance is 50 ppm maximum.

Table 6-86. Switching Characteristics Over Recommended Operating Conditions for USB2.0 [USB0] (see Figure 6-48)

No.	PARAMETER	LOW SPEED 1.5 Mbps		FULL SPEED 12 Mbps		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{r(D)}$ Rise time, USB0_DP and USB0_DM signals ⁽¹⁾	75	300	4	20	ns
2	$t_{f(D)}$ Fall time, USB0_DP and USB0_DM signals ⁽¹⁾	75	300	4	20	ns
3	t_{rFM} Rise/Fall time, matching ⁽²⁾	80	120	90	111	%
4	V_{CRS} Output signal cross-over voltage ⁽¹⁾	1.3	2	1.3	2	V
5	$t_{jr(source)NT}$ Source (Host) Driver jitter, next transition		2		2	ns
	$t_{jr(FUNC)NT}$ Function Driver jitter, next transition		25		2	ns
6	$t_{jr(source)PT}$ Source (Host) Driver jitter, paired transition ⁽³⁾		1		1	ns
	$t_{jr(FUNC)PT}$ Function Driver jitter, paired transition		10		1	ns
7	$t_{w(EOPT)}$ Pulse duration, EOP transmitter ⁽⁴⁾	1250	1500	160	175	ns
8	$t_{w(EOPR)}$ Pulse duration, EOP receiver ⁽⁴⁾	670		82		ns
9	$t_{(DRATE)}$ Data Rate		1.5		12	Mb/s
10	Z_{DRV} Driver Output Resistance	–	–	40.5	49.5	Ω
11	Z_{INP} Receiver Input Impedance	100k		100k		Ω

- (1) Low Speed: $C_L = 200$ pF, Full Speed: $C_L = 50$ pF
(2) $t_{RFM} = (t_r/t_f) \times 100$. [Excluding the first transaction from the Idle state.]
(3) $t_{jr} = t_{px(1)} - t_{px(0)}$
(4) Must accept as valid EOP

Figure 6-48. USB0 Integrated Transceiver Interface Timing

6.24.2 USB0 Unused Signal Configuration

If USB0 is unused, then the USB0 signals should be configured as shown in [Section 3.6.19](#).

6.25 Power and Sleep Controller (PSC)

The Power and Sleep Controllers (PSC) are responsible for managing transitions of system power on/off, clock on/off, resets (device level and module level). It is used primarily to provide granular power control for on chip modules (peripherals and CPU). A PSC module consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupts, a state machine for each peripheral/module it controls. An LPSC is associated with every module that is controlled by the PSC and provides clock and reset control.

The PSC includes the following features:

- Provides a software interface to:
 - Control module clock enable/disable
 - Control module reset
 - Control CPU local reset
- Supports ICEPick TAP Router power, clock and reset features. For details on ICEPick features see <http://tiexpressdsp.com/wiki/index.php?title=ICEPick>.

Table 6-87. Power and Sleep Controller (PSC) Registers

PSC0 BYTE ADDRESS	PSC1 BYTE ADDRESS	ACRONYM	DESCRIPTION
0x01C1 0000	0x01E2 7000	REVID	Peripheral Revision and Class Information Register

		MDCTL0-MDCTL31	Module Control <i>n</i> Register (modules 0-31) (PSC1)

6.25.1 Power Domain and Module Topology

The device includes two PSC modules.

Each PSC module controls clock states for several of the on chip modules, controllers and interconnect components. [Table 6-88](#) and [Table 6-89](#) lists the set of peripherals/modules that are controlled by the PSC, the power domain they are associated with, the LPSC assignment and the default (power-on reset) module states. See the device-specific data manual for the peripherals available on a given device. The module states and terminology are defined in [Section 6.25.1.2](#).

Table 6-88. PSC0 Default Module Configuration

LPSC Number	Module Name	Power Domain	Default Module State	Auto Sleep/Wake Only
0	EDMA3 Channel Controller	AlwaysON (PD0)	SwRstDisable	—
1	EDMA3 Transfer Controller 0	AlwaysON (PD0)	SwRstDisable	—

31	On-chip RAM (Br 13)	PD_SHRAM	Enable	Yes

6.25.1.1 Power Domain States

A power domain can only be in one of the two states: ON or OFF, defined as follows:

- ON: power to the domain is on
- OFF: power to the domain is off

In the device, for both PSC0 and PSC1, the Always ON domain, or PD0 power domain, is always in the ON state when the chip is powered-on. This domain is not programmable to OFF state.

- On PSC1 PD1/PD_SHRAM Domain: Controls the sleep state for the 128K Shared RAM

6.25.1.2 Module States

The PSC defines several possible states for a module. These states are essentially a combination of the module reset asserted or de-asserted and module clock on/enabled or off/disabled. The module states are defined in [Table 6-90](#).

Table 6-90. Module States

Module State	Module Reset	Module Clock	Module State Definition
Enable	De-asserted	On	A module in the enable state has its module reset de-asserted and it has its clock on. This is the normal operational state for a given module
Disable	De-asserted	Off	A module in the disabled state has its module reset de-asserted and it has its module clock off. This state is typically used for disabling a module clock to save power. The device is designed in full static CMOS, so when you stop a module clock, it retains the module's state. When the clock is restarted, the module resumes operating from the stopping point.
SyncReset	Asserted	On	A module state in the SyncReset state has its module reset asserted and it has its clock on. Generally, software is not expected to initiate this state
SwRstDisable	Asserted	Off	A module in the SwResetDisable state has its module reset asserted and it has its clock disabled. After initial power-on, several modules come up in the SwRstDisable state. Generally, software is not expected to initiate this state
Auto Sleep	De-asserted	Off	A module in the Auto Sleep state also has its module reset de-asserted and its module clock disabled, similar to the Disable state. However this is a special state, once a module is configured in this state by software, it can "automatically" transition to "Enable" state whenever there is an internal read/write request made to it, and after servicing the request it will "automatically" transition into the sleep state (with module reset re de-asserted and module clock disabled), without any software intervention. The transition from sleep to enabled and back to sleep state has some cycle latency associated with it. It is not envisioned to use this mode when peripherals are fully operational and moving data.
Auto Wake	De-asserted	Off	A module in the Auto Wake state also has its module reset de-asserted and its module clock disabled, similar to the Disable state. However this is a special state, once a module is configured in this state by software, it will "automatically" transition to "Enable" state whenever there is an internal read/write request made to it, and will remain in the "Enabled" state from then on (with module reset re de-asserted and module clock on), without any software intervention. The transition from sleep to enabled state has some cycle latency associated with it. It is not envisioned to use this mode when peripherals are fully operational and moving data.

6.26 Programmable Real-Time Unit Subsystem (PRUSS)

The Programmable Real-Time Unit Subsystem (PRUSS) consists of

- Two Programmable Real-Time Units (PRU0 and PRU1) and their associated memories
- An Interrupt Controller (INTC) for handling system interrupt events. The INTC also supports posting events back to the device level host CPU.
- A Switched Central Resource (SCR) for connecting the various internal and external masters to the resources inside the PRUSS.

The two PRUs can operate completely independently or in coordination with each other. The PRUs can also work in coordination with the device level host CPU. This is determined by the nature of the program which is loaded into the PRUs instruction memory. Several different signaling mechanisms are available between the two PRUs and the device level host CPU.

The PRUs are optimized for performing embedded tasks that require manipulation of packed memory mapped data structures, handling of system events that have tight realtime constraints and interfacing with systems external to the device.

The PRUSS comprises various distinct addressable regions. Externally the subsystem presents a single 64Kbyte range of addresses. The internal interconnect bus (also called switched central resource, or SCR) of the PRUSS decodes accesses for each of the individual regions. The PRUSS memory map is documented in [Table 6-91](#) and in [Table 6-92](#). Note that these two memory maps are implemented inside the PRUSS and are local to the components of the PRUSS.

Table 6-91. Programmable Real-Time Unit Subsystem (PRUSS) Local Instruction Space Memory Map

BYTE ADDRESS	PRU0	PRU1
0x0000 0000 - 0x0000 0FFF	PRU0 Instruction RAM	PRU1 Instruction RAM

Table 6-92. Programmable Real-Time Unit Subsystem (PRUSS) Local Data Space Memory Map

BYTE ADDRESS	PRU0	PRU1
0x0000 0000 - 0x0000 01FF	Data RAM 0 ⁽¹⁾	Data RAM 1 ⁽¹⁾
0x0000 0200 - 0x0000 1FFF	Reserved	Reserved
0x0000 2000 - 0x0000 21FF	Data RAM 1 ⁽¹⁾	Data RAM 0 ⁽¹⁾
0x0000 2200 - 0x0000 3FFF	Reserved	Reserved
0x0000 4000 - 0x0000 6FFF	INTC Registers	INTC Registers
0x0000 7000 - 0x0000 73FF	PRU0 Control Registers	PRU0 Control Registers
0x0000 7400 - 0x0000 77FF	Reserved	Reserved
0x0000 7800 - 0x0000 7BFF	PRU1 Control Registers	PRU1 Control Registers
0x0000 7C00 - 0xFFFF FFFF	Reserved	Reserved

- (1) Note that PRU0 accesses Data RAM0 at address 0x0000 0000, also PRU1 accesses Data RAM1 at address 0x0000 0000. Data RAM0 is intended to be the primary data memory for PRU0 and Data RAM1 is intended to be the primary data memory for PRU1. However for passing information between PRUs, each PRU can access the data ram of the 'other' PRU through address 0x0000 2000.

The global view of the PRUSS internal memories and control ports is documented in [Table 6-93](#). The offset addresses of each region are implemented inside the PRUSS but the global device memory mapping places the PRUSS slave port in the address range 0x01C3 0000-0x01C3 FFFF. The PRU0 and PRU1 can use either the local or global addresses to access their internal memories, but using the local addresses will provide access time several cycles faster than using the global addresses. This is because when accessing via the global address the access needs to be routed through the switch fabric outside PRUSS and back in through the PRUSS slave port.

Table 6-93. Programmable Real-Time Unit Subsystem (PRUSS) Global Memory Map

BYTE ADDRESS	REGION
0x01C3 0000 - 0x01C3 01FF	Data RAM 0
0x01C3 0200 - 0x01C3 1FFF	Reserved
0x01C3 2000 - 0x01C3 21FF	Data RAM 1
0x01C3 2200 - 0x01C3 3FFF	Reserved
0x01C3 4000 - 0x01C3 6FFF	INTC Registers
0x01C3 7000 - 0x01C3 73FF	PRU0 Control Registers
0x01C3 7400 - 0x01C3 77FF	PRU0 Debug Registers
0x01C3 7800 - 0x01C3 7BFF	PRU1 Control Registers
0x01C3 7C00 - 0x01C3 7FFF	PRU1 Debug Registers
0x01C3 8000 - 0x01C3 8FFF	PRU0 Instruction RAM
0x01C3 9000 - 0x01C3 BFFF	Reserved
0x01C3 C000 - 0x01C3 CFFF	PRU1 Instruction RAM
0x01C3 D000 - 0x01C3 FFFF	Reserved

Each of the PRUs can access the rest of the device memory (including memory mapped peripheral and configuration registers) using the global memory space addresses.

6.26.1 PRUSS Register Descriptions

Table 6-94. Programmable Real-Time Unit Subsystem (PRUSS) Control / Status Registers

PRU0 BYTE ADDRESS	PRU1 BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION
0x01C3 7000	0x01C3 7800	CONTROL	PRU Control Register

6.27 Emulation Logic

This section describes the steps to use a third party debugger. The debug capabilities and features for ARM are as shown below.

For TI's latest debug and emulation information see :

<http://tiexpressdsp.com/wiki/index.php?title=Category:Emulation>

ARM:

- Basic Debug
 - Execution Control
 - System Visibility
- Advanced Debug
 - Global Start
 - Global Stop
- Advanced System Control
 - Subsystem reset via debug
 - Peripheral notification of debug events
 - Cache-coherent debug accesses
- Program Trace
 - Program flow corruption
 - Code coverage
 - Path coverage
 - Thread/interrupt synchronization problems
- Data Trace
 - Memory corruption
- Timing Trace
 - Profiling
- Analysis Actions
 - Stop program execution
 - Control trace streams
 - Generate debug interrupt
 - Benchmarking with counters
 - External trigger generation
 - Debug state machine state transition
 - Combinational and Sequential event generation
- Analysis Events
 - Program event detection
 - Data event detection
 - External trigger Detection
 - System event detection (i.e. cache miss)
 - Debug state machine state detection
- Analysis Configuration
 - Application access
 - Debugger access

Table 6-96. ARM Debug Features

Category	Hardware Feature	Availability
Basic Debug	Software breakpoint	Unlimited
	Hardware breakpoint	Up to 14 HWBPs, including: 2 precise ⁽¹⁾ HWBP inside ARM core which are shared with watch points. 8 imprecise ⁽¹⁾ HWBPs from ETM's address comparators, which are shared with trace function, and can be used as watch point too. 4 imprecise ⁽¹⁾ HWBPs from ICECrusher.
Analysis	Watch point	Up to 6 watch points, including: 2 from ARM core which is shared with HWBPs and can be associated with a data. 8 from ETM's address comparators, which are shared with trace function, and HWBPs.
	Watch point with Data	2 from ARM core which is shared with HWBPs. 8 watch points from ETM can be associated with a data comparator, and ETM has total 4 data comparators.
	Counters/timers	3x32-bit (1 cycle ; 2 event)
	External Event Trigger In	1
Trace Control	External Event Trigger Out	1
	Address range for trace	4
	Data qualification for trace	2
	System events for trace control	20
	Counters/Timers for trace control	2x16-bit
	State Machines/Sequencers	1x3-State State Machine
	Context/Thread ID Comparator	1
On-chip Trace Capture	Independent trigger control units	12
	Capture depth PC	4k bytes ETB
	Capture depth PC + Timing	4k bytes ETB
	Application accessible	Y

(1) Precise hardware breakpoints will halt the processor immediately prior to the execution of the selected instruction. Imprecise breakpoints will halt the processor some number of cycles after the selected instruction depending on device conditions.

6.27.1 JTAG Port Description

The device target debug interface uses the five standard IEEE 1149.1(JTAG) signals ($\overline{\text{TRST}}$, TCK, TMS, TDI, and TDO), and a return clock (RTCK) due to the clocking requirements of the ARM926EJ-S .

TRST holds the debug and boundary scan logic in reset when pulled low (its default state). Since TRST has an internal pull-down resistor, this ensures that at power up the device functions in its normal (non-test) operation mode if TRST is not connected. Otherwise, TRST should be driven inactive by the emulator or boundary scan controller. Boundary scan test cannot be performed while the TRST pin is pulled low.

Table 6-97. JTAG Port Description

PIN	TYPE	NAME	DESCRIPTION
$\overline{\text{TRST}}$	I	Test Logic Reset	When asserted (active low) causes all test and debug logic in the device to be reset along with the IEEE 1149.1 interface
TCK	I	Test Clock	This is the test clock used to drive an IEEE 1149.1 TAP state machine and logic. Depending on the emulator attached to , this is a free running clock or a gated clock depending on RTCK monitoring.
RTCK	O	Returned Test Clock	Synchronized TCK. Depending on the emulator attached to, the JTAG signals are clocked from RTCK or RTCK is monitored by the emulator to gate TCK.
TMS	I	Test Mode Select	Directs the next state of the IEEE 1149.1 test access port state machine
TDI	I	Test Data Input	Scan data input to the device
TDO	O	Test Data Output	Scan data output of the device

6.27.2 Scan Chain Configuration Parameters

Table 6-98 shows the TAP configuration details required to configure the router/emulator for this device.

Table 6-98. JTAG Port Description

Router Port ID	Default TAP	TAP Name	Tap IR Length
17	No	Reserved	38
18	No	ARM926	4
19	No	ETB	4

The router is ICEPick revision C and has a 6-bit IR length.

6.27.3 Initial Scan Chain Configuration

The first level of debug interface that sees the scan controller is the TAP router module. The debugger can configure the TAP router for serially linking up to 16 TAP controllers or individually scanning one of the TAP controllers without disrupting the IR state of the other TAPs.

6.27.3.1 Adding TAPS to the Scan Chain

The TAP router must be programmed to add additional TAPs to the scan chain. The following JTAG scans must be completed to add the ARM926EJ-S to the scan chain.

A Power-On Reset (POR) or the JTAG Test-Logic Reset state configures the TAP router to contain only the router's TAP.

Figure 6-49. Adding ARM926EJ-S to the scan chain

Pre-amble: The device whose data reaches the emulator first is listed first in the board configuration file. This device is a pre-amble for all the other devices. This device has the lowest device ID.

Post-amble: The device whose data reaches the emulator last is listed last in the board configuration file. This device is a post-amble for all the other devices. This device has the highest device ID.

- Function : Update the JTAG preamble and post-amble counts.
 - Parameter : The IR pre-amble count is '0'.
 - Parameter : The IR post-amble count is '0'.
 - Parameter : The DR pre-amble count is '0'.
 - Parameter : The DR post-amble count is '0'.
 - Parameter : The IR main count is '6'.
 - Parameter : The DR main count is '1'.
- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'pause-ir'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is '0x00000007'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-dr'.
 - Parameter : The JTAG destination state is 'pause-dr'.
 - Parameter : The bit length of the command is '8'.
 - Parameter : The send data value is '0x00000089'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'pause-ir'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is '0x00000002'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Embed the port address in next command.
 - Parameter : The port address field is '0x0f000000'.
 - Parameter : The port address value is '3'.

- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-dr'.
 - Parameter : The JTAG destination state is 'pause-dr'.
 - Parameter : The bit length of the command is '32'.
 - Parameter : The send data value is '0xa2002108'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Do a send-only all-ones JTAG IR/DR scan.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'run-test/idle'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is 'all-ones'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Wait for a minimum number of TCLK pulses.
 - Parameter : The count of TCLK pulses is '10'.
- Function : Update the JTAG preamble and post-amble counts.
 - Parameter : The IR pre-amble count is '0'.
 - Parameter : The IR post-amble count is '6'.
 - Parameter : The DR pre-amble count is '0'.
 - Parameter : The DR post-amble count is '1'.
 - Parameter : The IR main count is '4'.
 - Parameter : The DR main count is '1'.

The initial scan chain contains only the TAP router module. The following steps must be completed in order to add ETB TAP to the scan chain.

Figure 6-50. Adding ETB to the scan chain

- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'pause-ir'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is '0x00000007'.
 - Parameter : The actual receive data is 'discarded'.

- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-dr'.
 - Parameter : The JTAG destination state is 'pause-dr'.
 - Parameter : The bit length of the command is '8'.
 - Parameter : The send data value is '0x00000089'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'pause-ir'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is '0x00000002'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Embed the port address in next command.
 - Parameter : The port address field is '0x0f000000'.
 - Parameter : The port address value is '3'.
- Function : Do a send-only JTAG IR/DR scan.
 - Parameter : The route to JTAG shift state is 'shortest transition'.
 - Parameter : The JTAG shift state is 'shift-dr'.
 - Parameter : The JTAG destination state is 'pause-dr'.
 - Parameter : The bit length of the command is '32'.
 - Parameter : The send data value is '0xa3302108'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Do a send-only all-ones JTAG IR/DR scan.
 - Parameter : The JTAG shift state is 'shift-ir'.
 - Parameter : The JTAG destination state is 'run-test/idle'.
 - Parameter : The bit length of the command is '6'.
 - Parameter : The send data value is 'all-ones'.
 - Parameter : The actual receive data is 'discarded'.
- Function : Wait for a minimum number of TCLK pulses.
 - Parameter : The count of TCLK pulses is '10'.
- Function : Update the JTAG preamble and post-amble counts.
 - Parameter : The IR pre-amble count is '0'.
 - Parameter : The IR post-amble count is '6 + 4'.
 - Parameter : The DR pre-amble count is '0'.
 - Parameter : The DR post-amble count is '1 + 1'.
 - Parameter : The IR main count is '4'.
 - Parameter : The DR main count is '1'.

6.27.4 JTAG 1149.1 Boundary Scan Considerations

To use boundary scan, the following sequence should be followed:

- Execute a valid reset sequence and exit reset
- Wait at least 6000 OSCIN clock cycles
- Enter boundary scan mode using the JTAG pins

If TRST is not driven by the boundary scan tool or tester, TRST should be externally pulled high during boundary scan testing.

6.28 IEEE 1149.1 JTAG

The JTAG ⁽¹⁾ interface is used for BSDL testing and emulation of the device.

The device requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the device, $\overline{\text{TRST}}$ initializes the device's emulation logic. Both resets are required for proper operation.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the device to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and device's emulation logic in the reset state.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

$\overline{\text{RESET}}$ must be released only in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$.

For maximum reliability, the device includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

6.28.1 JTAG Peripheral Register Description(s) – JTAG ID Register (DEVIDR0)

Table 6-99. DEVIDR0 Register

BYTE ADDRESS	ACRONYM	REGISTER DESCRIPTION	COMMENTS
0x01C1 4018	DEVIDR0	JTAG Identification Register	Read-only. Provides 32-bit JTAG ID of the device.

(1) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the device, the JTAG ID register resides at address location 0x01C1 4018. The register hex value for each silicon revision is:

- 0x8B7D F02F for silicon revision 1.1
- 0x9B7D F02F for silicon revisions 3.0, 2.1, and 2.0

For the actual register bit names and their associated bit field descriptions, see [Figure 6-51](#) and [Table 6-100](#).

Figure 6-51. JTAG ID (DEVIDR0) Register Description - Register Value

31	28	27	12	11	1	0

7 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

7.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *AM1705*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, *ZKB*), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz (for example, *375*). [Figure 7-1](#) provides a legend for reading the complete device name for any *AM1705* device.

For orderable part numbers of *AM1705* devices in the *your package* package types, see the Package Option Addendum of this document, ti.com, or contact your TI sales representative.

Figure 7-1. Device Nomenclature

7.2 Tools and Software

TI offers an extensive line of development tools for the device platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of the device applications:

Software

Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools **Development Tools**

Extended Development System (XDS™) Emulator For a complete listing of development-support tools for the device, visit the Texas Instruments web site on the Worldwide Web at www.ti.com uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

7.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the DSP, related peripherals, and other technical collateral is listed below.

User's Guides

SPRUGU3 *AM1705 ARM Microprocessor System Reference Guide*

SPRUFU0 *AM17x/AM18x ARM Microprocessor Peripherals Overview Reference Guide*

7.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community The TI engineer-to-engineer (E2E) community was created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

TI Embedded Processors Wiki Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

7.5 Trademarks

E2E is a trademark of Texas Instruments.

ARM9 is a trademark of ARM.

ETM9, CoreSight are trademarks of ARM Limited.

All other trademarks are the property of their respective owners.

7.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.7 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

7.8 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

8 Mechanical Packaging and Orderable Information

This section describes the device orderable part numbers, packaging options, materials, thermal and mechanical parameters.

8.1 Thermal Data for PTP

The following table(s) show the thermal resistance characteristics for the PowerPAD™ PTP mechanical package.

Table 8-1. Thermal Resistance Characteristics (PowerPAD™ Package) [PTP]"

No.		°C/W ⁽¹⁾	°C/W ⁽²⁾	°C/W ⁽³⁾	°C/W ⁽⁴⁾	AIR FLOW (m/s) ⁽⁵⁾
1	R _{θJC} Junction-to-case	7.8	9.4	8.6	10.1	N/A
2	R _{θJB} Junction-to-board	6.2	9.9	7.1	10.6	N/A
3	R _{θJA} Junction-to-free air	21.3	27.9	23.2	30.6	0.00
4	R _{θJMA} Junction-to-moving air	14.3	20.2		22.6	0.50
5		13.1	18.6		21.0	1.00
6		12.1	17.4		19.6	2.00
7		11.2	16.2		18.2	4.00
8	Psi _{JT} Junction-to-package top	0.5	0.7		0.8	0.00
9		0.6	0.9		1.0	0.50

17		5.8	8.5		9.6	4.00

- (1) Simulation data, using a model of a JEDEC defined 2S2P system with a 12mmx12mm copper pad on the top and bottom copper layers connected with an 8x8 thermal via array and soldered to the package thermal pad. Power dissipation of 1W assumed, 70C Ambient temp assumed. Signal layer copper coverage 20%, inner layer copper coverage 90%. Actual performance will change based on environment as well as application. For more information, see these EIA/JEDEC standards – EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)* and JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*.
- (2) Simulation data, using the same model but with 1oz (35um) top and bottom copper thickness and 0.5oz (18um) inner copper thickness. Power dissipation of 1W and ambient temp of 70C assumed.
- (3) Simulation data, 1S1P PCB model with 12x12mm copper pad on the top layer soldered to device thermal pad and connected to the bottom copper layer (90% copper) with an 8x8 thermal via array. Power dissipation of 1W and ambient temp of 70C assumed. Copper thickness 2oz (70um) top and bottom.
- (4) Simulation data, 1S1P PCB model with 12x12mm copper pad on the top layer soldered to device thermal pad and connected to the bottom copper layer (90% copper) with an 8x8 thermal via array. Power dissipation of 1W and ambient temp of 70C assumed. Copper thickness 1oz (35um) top and bottom.
- (5) m/s = meters per second

8.2 Supplementary Information About the 176-pin PTP PowerPAD™ Package

This section highlights a few important details about the 176-pin PTP PowerPAD™ package. Texas Instruments' [PowerPAD Thermally Enhanced Package Technical Brief \(SLMA002\)](#) should be consulted when creating a PCB footprint for this device.

8.2.1 Standoff Height

As illustrated in Figure 8-1, the standoff height specification for this device (between 0.050 mm and 0.150 mm) is measured from the seating plane established by the three lowest package pins to the **lowest** point on the package body. Due to warpage, the lowest point on the package body is located in the center of the package at the exposed thermal pad.

Using this definition of standoff height provides the correct result for determining the correct solder paste thickness. According to TI's [PowerPAD Thermally Enhanced Package Technical Brief \(SLMA002\)](#), the recommended range of solder paste thickness for this package is between 0.152 mm and 0.178 mm.

Figure 8-1. Standoff Height Measurement on 176-pin PTP Package

8.2.2 PowerPAD™ PCB Footprint

In general, for proper thermal performance, the thermal pad under the package body should be as large as possible. However, the soldermask opening for the PowerPAD™ should be sized to match the pad size on the 176-pin PTP package; as illustrated in Figure 8-2.

Figure 8-2. Soldermask Opening Should Match Size of Package Thermal Pad

8.3 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
AM1705DPTP3	ACTIVE	HLQFP	PTP	176	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-4-260C-72 HR	0 to 90	AM1705DPTP3	Samples
AM1705DPTP4	ACTIVE	HLQFP	PTP	176	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-4-260C-72 HR	0 to 90	AM1705DPTP4	Samples
AM1705DPTPA3	ACTIVE	HLQFP	PTP	176	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-4-260C-72 HR	-40 to 105	AM1705DPTPA3	Samples
AM1705DPTPD4	ACTIVE	HLQFP	PTP	176	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-4-260C-72 HR	-40 to 90	AM1705DPTPD4	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MO-026

PowerPAD is a trademark of Texas Instruments.

PTP (S-PQFP-G176)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

PTP (S-PQFP-G176)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
