MAX6751KA26+T**

MAX6746–MAX6753

µP Reset Circuits with Capacitor-Adjustable Reset/Watchdog Timeout Delay

General Description

The MAX6746–MAX6753 low-power microprocessor (µP) supervisory circuits monitor single/dual system supply voltages from 1.575V to 5V and provide maximum adjustability for reset and watchdog functions. These devices assert a reset signal whenever the V_{CC} supply voltage or RESET IN falls below its reset threshold or when manual reset is pulled low. The reset output remains asserted for the reset timeout period after V_{CC} and RESET IN rise above the reset threshold. The reset function features immunity to power-supply transients.

The MAX6746–MAX6753 have $\pm 2\%$ factory-trimmed reset threshold voltages in approximately 100mV increments from 1.575V to 5.0V and/or adjustable reset threshold voltages using external resistors.

The reset and watchdog delays are adjustable with external capacitors. The MAX6746–MAX6751 contain a watchdog select input that extends the watchdog timeout period by 128x. The MAX6752/MAX6753 contain a window watchdog timer that looks for activity outside an expected window of operation.

The MAX6746–MAX6753 are available with a push-pull or open-drain active-low RESE \bar{T} output. The MAX6746–MAX6753 are available in an 8-pin SOT23 package and are fully specified over the automotive temperature range (-40°C to +125°C).

Applications

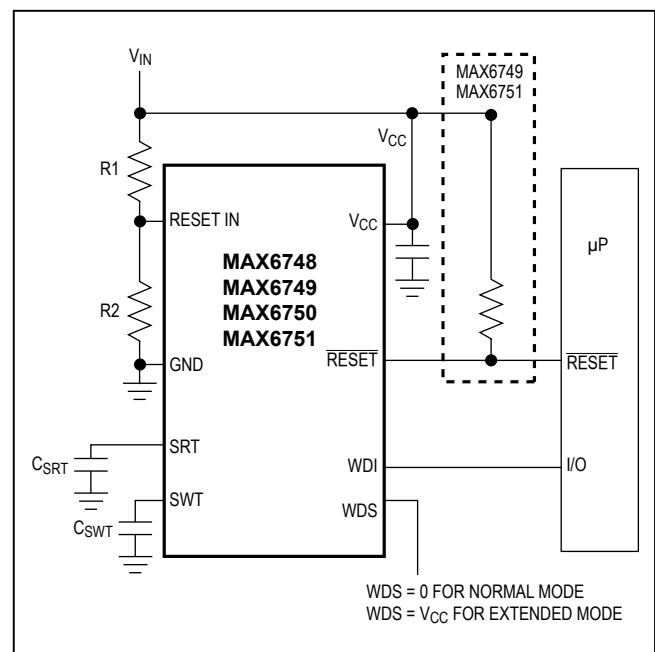

- Medical Equipment
- Automotive
- Intelligent Instruments
- Portable Equipment
- Battery-Powered Computers/Controllers
- Embedded Controllers
- Critical µP Monitoring
- Set-Top Boxes
- Computers

[Selector Guide](#) and [Ordering Information](#) appear at end of [data sheet](#).

Benefits and Features

- Configurable Reset and Watchdog Options Enables Wide Variety of Applications
 - Factory-Set Reset Threshold Options from 1.575V to 5V in $\sim 100\text{mV}$ Increments
 - Adjustable Reset Threshold Options
 - Single/Dual Voltage Monitoring
 - Capacitor-Adjustable Reset Timeout
 - Capacitor-Adjustable Watchdog Timeout
 - Min/Max (Windowed) Watchdog Option
 - Manual-Reset Input Option
 - Push-Pull or Open-Drain RESE \bar{T} Output Options
- 3.7µA Supply Current Reduces System Power Consumption
- Integrated Power Supply Protection Increases Robustness
 - Power-Supply Transient Immunity
 - Guaranteed RESE \bar{T} Valid for $V_{CC} \geq 1\text{V}$
- 8-Pin SOT23 Packages Saves Board Space
- AEC-Q100 Qualified. Refer to [Ordering Information](#) for Specific I/V Trim Variants

Typical Operating Circuit

Absolute Maximum Ratings

| | | | |
|--|-----------------------------------|---|-----------------|
| V _{CC} to GND..... | -0.3V to +6.0V | Continuous Power Dissipation (T _A = +70°C) | |
| SRT, SWT, SET0, SET1, RESET IN, WDS, MR, WDI, to GND..... | -0.3V to (V _{CC} + 0.3V) | 8-Pin SOT23 (derate 5.1mW/°C above +70°C)..... | 408.2mW |
| RESET (Push-Pull) to GND..... | -0.3V to (V _{CC} + 0.3V) | Operating Temperature Range | -40°C to +125°C |
| RESET (Open-Drain) to GND..... | -0.3V to +6.0V | Storage Temperature Range | -65°C to +150°C |
| Input Current (All Pins)..... | ±20mA | Junction Temperature..... | +150°C |
| Output Current (RESET) | ±20mA | Lead Temperature (soldering, 10s) | +300°C |
| | | Soldering Temperature (reflow) | +260°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

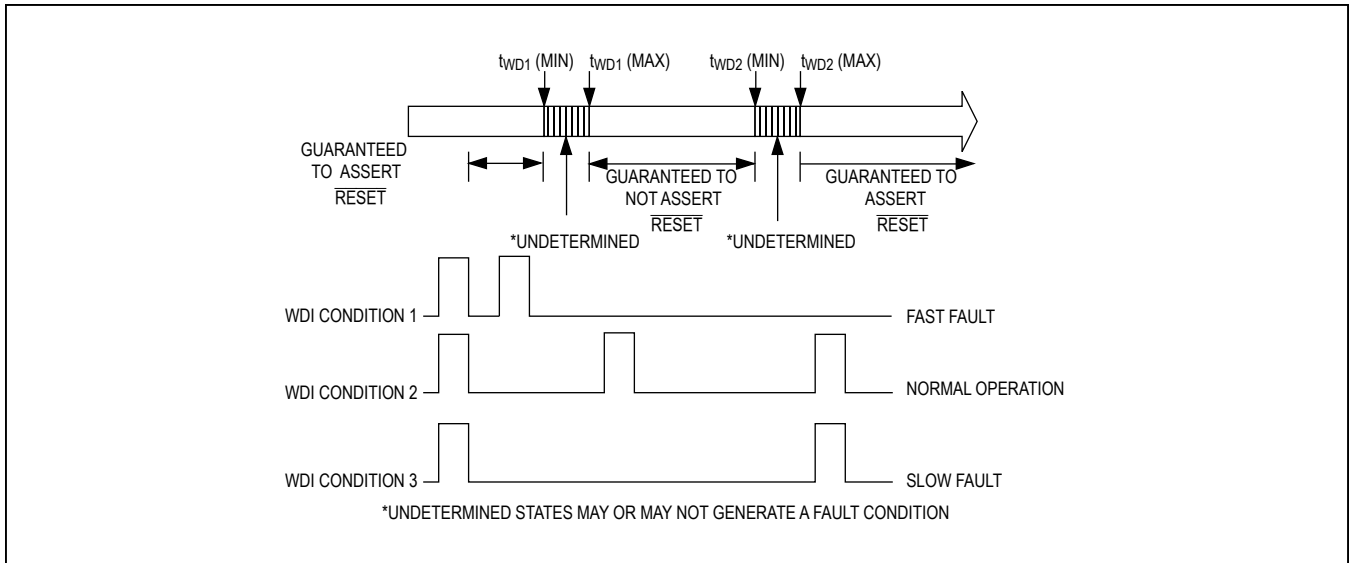

Figure 1. MAX6752/MAX6753 Detailed Watchdog Input Timing Relationship

Detailed Description

The MAX6746–MAX6753 assert a reset signal whenever the V_{CC} supply voltage or RESET IN falls below its reset threshold. The reset output remains asserted for the reset timeout period after V_{CC} and RESET IN rise above its respective reset threshold. A watchdog timer triggers a reset pulse whenever a watchdog fault occurs.

The reset and watchdog delays are adjustable with external capacitors. The MAX6746–MAX6751 contain a watchdog select input that extends the watchdog timeout period to 128x.

The MAX6752 and MAX6753 have a sophisticated watchdog timer that detects when the processor is running outside an expected window of operation. The watchdog signals a fault when the input pulses arrive too early (faster than the selected t_{WD1} timeout period) or too late (slower than the selected t_{WD2} timeout period) (see Figure 1).

Reset Output

The reset output is typically connected to the reset input of a µP. A µP's reset input starts or restarts the µP in a known state. The MAX6746–MAX6753 µP supervisory circuits provide the reset logic to prevent code-execution errors during power-up, power-down, and brownout conditions (see the *Typical Operating Circuit*). RESE_T changes from high to low whenever the monitored voltage, RESE_T IN and/or V_{CC} drop below the reset threshold voltages. Once V_{RESE_T IN} and/or V_{CC} exceeds its respective reset threshold voltage(s), RESE_T remains low for the reset timeout period, then goes high.

RESE_T is guaranteed to be in the correct logic state for V_{CC} greater than 1V. For applications requiring valid reset logic when V_{CC} is less than 1V, see the *Ensuring a Valid RESE_T Down to V_{CC} = 0V (Push-Pull RESE_T)* section.

RESE_T IN Threshold

The MAX6748–MAX6751 monitor the voltage on RESE_T IN using an adjustable reset threshold (V_{RESE_T IN}) set with an external resistor voltage-divider (Figure 2). Use the following formula to calculate the externally monitored voltage (V_{MON_TH}):

$$V_{MON_TH} = V_{RESE_T\ IN} \times (R1 + R2) / R2$$

Figure 2. Calculating the Monitored Threshold Voltage (V_{MON_TH})

Figure 3. Adding an External Manual-Reset Function to the MAX6748–MAX6751

where V_{MON_TH} is the desired reset threshold voltage and V_{TH} is the reset input threshold (1.235V). Resistors R1 and R2 can have very high values to minimize current consumption due to low leakage currents. Set R2 to some conveniently high value (500kΩ, for example) and calculate R1 based on the desired reset threshold voltage, using the following formula:

$$R1 = R2 \times (V_{MON_TH}/V_{RESET\ IN} - 1) (\Omega)$$

The MAX6748 and MAX6749 do not monitor V_{CC} supply voltage; therefore, V_{CC} must be greater than 1.5V to guarantee RESET IN threshold accuracy and

timing performance. The MAX6748 and MAX6749 can be configured to monitor V_{CC} voltage by connecting V_{CC} to V_{MON_TH} .

Dual-Voltage Monitoring (MAX6750/MAX6751)

The MAX6750 and MAX6751 contain both factory-trimmed threshold voltages and an adjustable reset threshold input, allowing the monitoring of two voltages, V_{CC} and V_{MON_TH} (see Figure 2). \overline{RESET} is asserted when either of the voltages fall below its respective threshold voltages.

Manual Reset (MAX6746/MAX6747)

Many µP-based products require manual-reset capability to allow an operator or external logic circuitry to initiate a reset. The manual-reset input (\overline{MR}) can connect directly to a switch without an external pullup resistor or debouncing network. \overline{MR} is internally pulled up to V_{CC} and, therefore, can be left unconnected if unused.

\overline{MR} is designed to reject fast, falling transients (typically 100ns pulses) and must be held low for a minimum of 1µs to assert the reset output. A 0.1µF capacitor from \overline{MR} to ground provides additional noise immunity. After \overline{MR} transitions from low to high, reset remains asserted for the duration of the reset timeout period.

A manual-reset option can easily be implemented with the MAX6748–MAX6751 by connecting a normally open momentary switch in parallel with R2 (Figure 3). When the switch is closed, the voltage on RESET IN goes to zero, initiating a reset. Similar to the MAX6746/MAX6747 manual reset, reset remains asserted while the voltage at RESET IN is zero and for the reset timeout period after the switch is opened.

Figure 4a. Watchdog Timing Diagram, WDS = GND

Figure 4b. Watchdog Timing Diagram, WDS = V_{CC}

Watchdog Timer

MAX6746–MAX6751

The watchdog's circuit monitors the μP's activity. If the μP does not toggle the watchdog input (WDI) within t_{WD} (user-selected), $\overline{\text{RESET}}$ asserts for the reset timeout period. The internal watchdog timer is cleared by any event that asserts $\overline{\text{RESET}}$, by a falling transition at WDI (which can detect pulses as short as 300ns), or by a transition at WDS. The watchdog timer remains cleared while reset is asserted; as soon as reset is released, the timer starts counting.

The MAX6746–MAX6751 feature two modes of watchdog operation: normal mode and extended mode. In normal mode (Figure 4a), the watchdog timeout period is determined by the value of the capacitor connected between SWT and ground. In extended mode (Figure 4b), the watchdog timeout period is multiplied by 128. For example, in extended mode, a 0.1μF capacitor gives a watchdog timeout period of 65s (see the Extended-Mode Watchdog Timeout Period vs. C_{SWT} graph in the [Typical Operating Circuit](#)). To disable the watchdog timer function, connect SWT to ground.

MAX6752/MAX6753

The MAX6752 and MAX6753 have a windowed watchdog timer that asserts $\overline{\text{RESET}}$ for the adjusted reset timeout period when the watchdog recognizes a fast watchdog fault ($t_{WD1} < t_{WD1}$), or a slow watchdog fault (period $> t_{WD2}$). The reset timeout period is adjusted independently of the watchdog timeout period.

The slow watchdog period (t_{WD2}) is calculated as follows:

$$t_{WD2} = 0.65 \times 10^9 \times C_{SWT}$$

with t_{WD2} in seconds and C_{SWT} in Farads.

The fast watchdog period (t_{WD1}) is selectable as a ratio from the slow watchdog fault period (t_{WD2}). Select the fast watchdog period by pin strapping SET0 and SET1, where high is V_{CC} and low is GND. [Table 1](#) illustrates

Table 1. Min/Max Watchdog Setting

| SET0 | SET1 | RATIO |
|------|------|-------------------|
| Low | Low | 8 |
| Low | High | 16 |
| High | Low | Watchdog Disabled |
| High | High | 64 |

the SET0 and SET1 configuration for the 8, 16, and 64 window ratio (t_{WD2}/t_{WD1}).

For example, if C_{SWT} is 1500pF, and SET0 and SET1 are low, then t_{WD2} is 975ms (typ) and t_{WD1} is 122ms (typ).

$\overline{\text{RESET}}$ asserts if the watchdog input has two falling edges too close to each other (faster than t_{WD1}) (Figure 5a) or falling edges that are too far apart (slower than t_{WD2}) (Figure 5b). Normal watchdog operation is displayed in Figure 5c. The internal watchdog timer is cleared when a WDI falling edge is detected within the valid watchdog window or when $\overline{\text{RESET}}$ is deasserted. All WDI inputs are ignored while $\overline{\text{RESET}}$ is asserted.

The watchdog timer begins to count after $\overline{\text{RESET}}$ is deasserted. The watchdog timer clears and begins to count after a valid WDI falling logic input. WDI falling transitions within periods shorter than t_{WD1} or longer than t_{WD2} force $\overline{\text{RESET}}$ to assert low for the reset timeout period. WDI falling transitions within the t_{WD1} and t_{WD2} window do not assert $\overline{\text{RESET}}$. WDI transitions between $t_{WD1(\text{min})}$ and $t_{WD1(\text{max})}$ or $t_{WD2(\text{min})}$ and $t_{WD2(\text{max})}$ are not guaranteed to assert or deassert $\overline{\text{RESET}}$. To guarantee that the window watchdog does not assert $\overline{\text{RESET}}$, strobe WDI between $t_{WD1(\text{max})}$ and $t_{WD2(\text{min})}$. The watchdog timer is cleared when $\overline{\text{RESET}}$ is asserted or after a falling transition on WDI, or after a state change on SET0 or SET1. Disable the watchdog timer by connecting SET0 high and SET1 low.

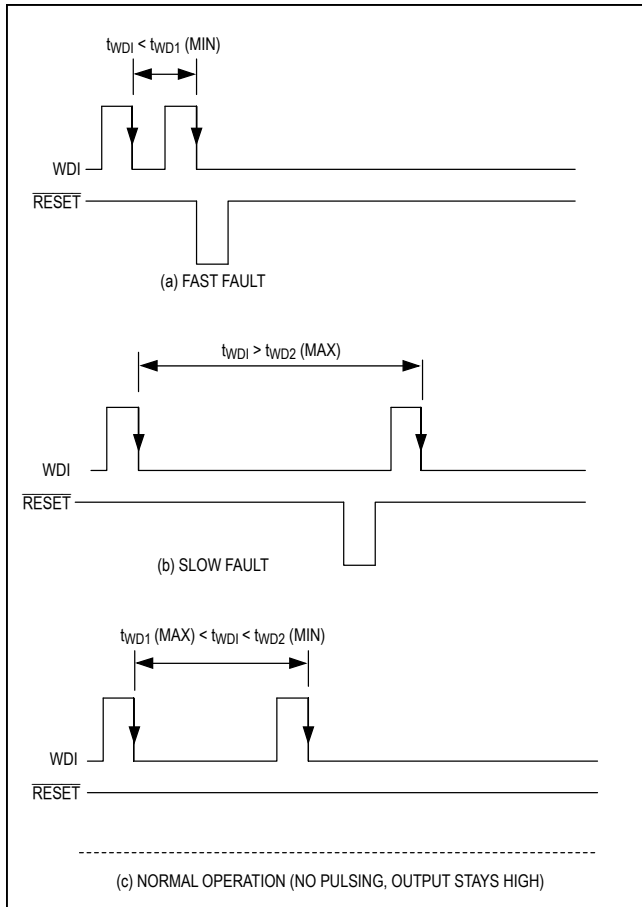

Figure 5. MAX6752/MAX6753 Window Watchdog Diagram

Applications Information

Selecting Reset/Watchdog Timeout Capacitor

The reset timeout period is adjustable to accommodate a variety of µP applications. Adjust the reset timeout period (t_{RP}) by connecting a capacitor (C_{SRT}) between SRT and ground. Calculate the reset timeout capacitor as follows:

$$C_{SRT} = t_{RP} / (4.94 \times 10^6)$$

with t_{RP} in seconds and C_{SRT} in Farads.

The watchdog timeout period is adjustable to accommodate a variety of µP applications. With this feature, the watchdog timeout can be optimized for software execution. The programmer can determine how often the watchdog timer should be serviced. Adjust the watchdog timeout period (t_{WD}) by connecting a specific value capacitor (C_{SWT}) between SWT and GND. For normal mode operation, calculate the watchdog timeout capacitor as follows:

$$C_{SWT} = t_{WD} / (4.94 \times 106)$$

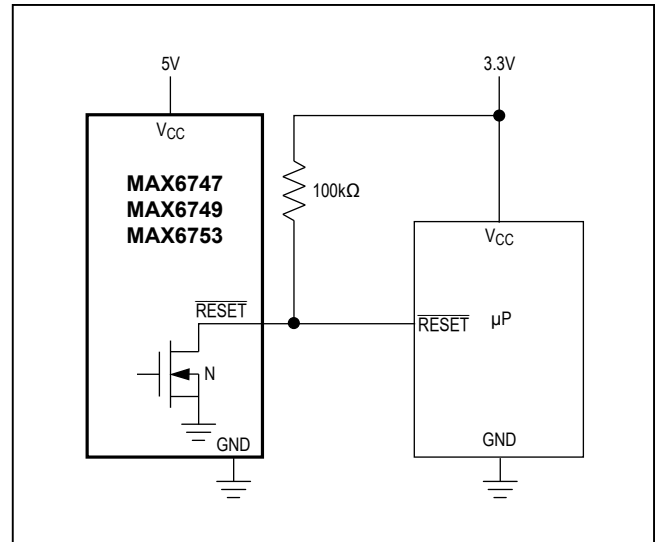

Figure 6. Interfacing to Other Voltage Levels

with t_{WD} in seconds and C_{SWT} in Farads.

For the MAX6752 and MAX6753 windowed watchdog function, calculate the slow watchdog period, t_{WD2} as follows:

$$t_{WD2} = 0.65 \times 10^9 \times C_{SWT}$$

C_{SRT} and C_{SWT} must be a low-leakage (< 10nA) type capacitor. Ceramic capacitors are recommended.

Transient Immunity

In addition to issuing a reset to the µP during power-up, power-down, and brownout conditions, these supervisors are relatively immune to short-duration supply transients (glitches). The Maximum Transient Duration vs. Reset Threshold Overdrive graph in the [Typical Operating Characteristics](#) shows this relationship.

The area below the curves of the graph is the region in which these devices typically do not generate a reset pulse. This graph was generated using a falling pulse applied to V_{CC} , starting above the actual reset threshold (V_{TH}) and ending below it by the magnitude indicated (reset threshold overdrive). As the magnitude of the transient increases (farther below the reset threshold), the maximum allowable pulse width decreases. Typically, a V_{CC} transient that goes 100mV below the reset threshold and lasts 50µs or less does not cause a reset pulse to be issued. For applications where the power supply to V_{CC} has high transient rates, $dV/dt > 5V/50µS$, an RC filter on V_{CC} is required. See [Figure 8. Application Circuit for High-Input Voltage Transient Applications](#).

Interfacing to Other Voltages for Logic Compatibility

The open-drain $\overline{\text{RESET}}$ output can be used to interface to a μP with other logic levels. As shown in Figure 6, the open-drain output can be connected to voltages from 0 to 6V.

Generally, the pullup resistor connected to $\overline{\text{RESET}}$ connects to the supply voltage that is being monitored at the IC's V_{CC} pin. However, some systems can use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply. Keep in mind that as the supervisor's V_{CC} decreases towards 1V, so does the IC's ability to sink current at $\overline{\text{RESET}}$. Also, with any pullup resistor, $\overline{\text{RESET}}$ is pulled high as V_{CC} decays toward zero. The voltage where this occurs depends on the pullup resistor value and the voltage to which it is connected.

Figure 7. Ensuring $\overline{\text{RESET}}$ Valid to $V_{CC} = 0V$

Ensuring a Valid $\overline{\text{RESET}}$ Down to $V_{CC} = 0V$ (Push-Pull $\overline{\text{RESET}}$)

When V_{CC} falls below 1V, $\overline{\text{RESET}}$ current sinking capabilities decline drastically. The high-impedance CMOS logic inputs connected to $\overline{\text{RESET}}$ can drift to undetermined voltages. This presents no problems in most applications, since most μPs and other circuitry do not operate with V_{CC} below 1V.

In those applications where $\overline{\text{RESET}}$ must be valid down to 0V, add a pulldown resistor between $\overline{\text{RESET}}$ and GND for the MAX6746/MAX6748/MAX6750/MAX6752 push/pull outputs. The resistor sinks any stray leakage currents, holding $\overline{\text{RESET}}$ low (Figure 7). The value of the pulldown resistor is not critical; 100kΩ is large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground. The external pulldown cannot be used with the open-drain reset outputs.

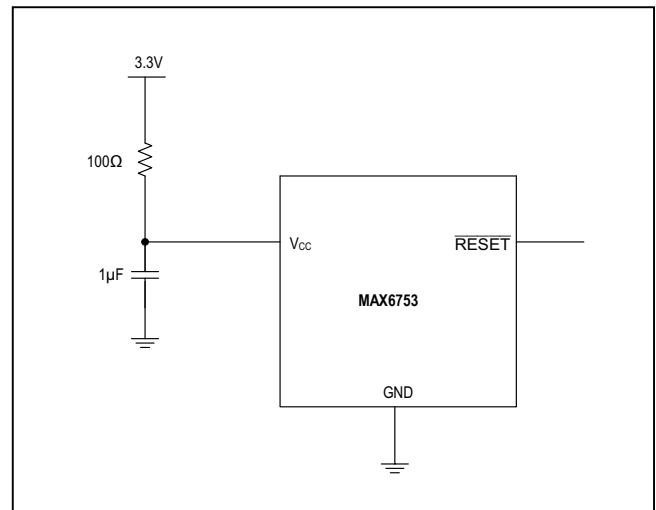

Figure 8. Application Circuit for High-Input Voltage Transient Applications

Table 2. Reset Threshold Voltage Suffix
(T_A = -40°C to +125°C)

| SUFFIX | MIN | TYP | MAX |
|----------------------------|--------------|--------------|--------------|
| 50 | 4.900 | 5.000 | 5.100 |

Note: “__” represents the two number suffix needed when ordering the reset threshold voltage value for the MAX6746/MAX6747 and MAX6750–MAX6753. The reset threshold voltages are available in approximately 100mV increments. Table 2 contains the suffix and reset factory-trimmed voltages. All devices are available in tape-and-reel only. There is a 2500-piece minimum order increment for standard versions (see Table 3). Sample stock is typically held on standard versions only. Nonstandard versions require a minimum order increment of 10,000 pieces. Contact factory for availability.

Devices are available in both leaded and lead(Pb)-free packaging.

+Denotes a lead(Pb)-free/RoHS-compliant package.

T = Tape and reel.

/V denotes an automotive qualified part.

*Future product—contact factory for availability.

PROCESS: BiCMOS

Revision History

| REVISION NUMBER | REVISION DATE | DESCRIPTION | PAGES CHANGED |
|-----------------|---------------|---|---------------|
| 0 | 7/02 | Initial release | — |
| 3 | 12/05 | Added the lead-free notation | 1 |
| 4 | 9/10 | Added the automotive version of the MAX6746 and the MAX6753 and revised the <i>Typical Operating Characteristics</i> | 1, 4 |
| 5 | 12/10 | Added the automotive version of the MAX6750 | 1 |
| 6 | 4/11 | Added the automotive version of the MAX6747 | 1 |
| 7 | 12/13 | Added the automotive version of the MAX6751 | 1 |
| 8 | 2/14 | Added a future product reference to MAX6751KA__ /V+T | 1 |
| 9 | 5/14 | Corrected typo | 10 |
| 10 | 6/14 | Added the automotive version of the MAX6752 | 1 |
| 11 | 9/15 | Added MAX6752A to data sheet with new limits | 2, 12, 14 |
| 12 | 12/15 | Added lead-free part numbers to <i>Ordering Information</i> table and lead-free package code to <i>Package Information</i> table | 14 |
| 13 | 2/16 | Added MAX6752AKA32+T to <i>Ordering Information</i> table | 14 |
| 14 | 9/16 | Updated t_{VD} equation value in <i>Pin Configuration</i> table and <i>Applications Information</i> section | 6, 10 |
| 15 | 1/17 | Added text to <i>Transient Immunity</i> section and added Figure 8 | 10, 11 |
| 16 | 10/17 | Added AEC qualification text to <i>Benefits and Features</i> section and updated <i>Ordering Information</i> table with additional part numbers | 1, 14 |
| 17 | 12/17 | Updated <i>Ordering Information</i> table with additional part numbers | 14 |
| 18 | 3/18 | Updated <i>Absolute Maxim Rating</i> and added <i>Package Information</i> section | 2 |
| 19 | 12/18 | Updated <i>Package Information</i> | 2 |
| 20 | 2/19 | Updated <i>Typical Operating Circuit</i> and Figure 6 | 1, 11 |
