

**THE DATASHEET OF  
M2004-02-644.5313**

## GENERAL DESCRIPTION

The M2004 variants -02 and -12 are VCISO (Voltage Controlled SAW Oscillator) based clock generator PLLs designed for clock frequency translation and jitter attenuation in a high-speed data communications system. The clock multiplication ratio and output divider ratio are pin selectable.

External loop components allow the tailoring of PLL loop response. The M2004-12 adds Hitless Switching with Phase Build-out (HS/PBO) to ensure that reference clock reselection does not disrupt the output clock.

*Also read about device variants -22, -32, -42, and -52 in the M2004-x2 Preliminary Information sheet.*

## PIN ASSIGNMENT (9 x 9 mm SMT)

Figure 1: Pin Assignment

## FEATURES

- ◆ Ideal for OC-48/192 data clock
- ◆ Integrated SAW (surface acoustic wave) delay line
- ◆ VCISO frequency from 300 to 700MHz (Specify VCISO center frequency at time of order)
- ◆ Low phase jitter of < 0.5ps rms, typical (12kHz to 20MHz or 50kHz to 80MHz)
- ◆ Pin-selectable configuration
- ◆ The M2004-12 adds Hitless Switching with Phase Build-out (HS/PBO) to ensure SONET/SDH MTIE and TDEV compliance during reference clock reselection
- ◆ Reference clock inputs support differential LVDS, LVPECL, as well as single-ended LVCMOS, LVTTL
- ◆ Industrial temperature available
- ◆ Single 3.3V power supply
- ◆ Small 9 x 9 mm SMT (surface mount) package

## Example Input / Output Frequency Combinations

Input Clock (MHz)	VCISO <sup>1</sup> Freq (MHz)	Output Freq (MHz)	Application
19.44	622.08	77.76	OC-12 / 48 / 192
38.80		155.52	
77.76		311.04	
155.52		622.08	
25.00	625.00	156.25	Gigabit Ethernet

1 1 1 1 1 1	M = 63		

Table 4: M Divider Pin Selection

Note 1:  $F_{VCSO} = 622.08\text{ MHz}$  (e.g., M2004-02-622.0800)

Note 2:  $F_{VCSO} = 625.00\text{ MHz}$  (e.g., M2004-02-625.0000)

Note 3: M5 pin has a pull-up resistor; M4-M0, pull-down.

## FUNCTIONAL DESCRIPTION

The M2004-02/-12 is a PLL (Phase Locked Loop) based clock generator that generates output clocks synchronized to one of two selectable input reference clocks. An internal high “Q” SAW delay line provides a low jitter clock signal.

The device can be pin-configured for feedback divider and output divider values. Output is LVPECL compatible. External loop filter component values set the PLL bandwidth to optimize jitter attenuation characteristics.

The M2004-12 adds Hitless Switching with Phase Build-out (HS/PBO) to provide SONET/SDH MTIE and TDEV compliance during a reference clock reselection using the internal mux or when using an external mux.

The M2004-02/-12 is ideal for clock jitter attenuation and frequency translation in 2.5 or 10 Gb optical network line card applications.

### Input Reference Clocks

An internal input MUX is provided for input reference clock selection. One input reference clock is selected from between a single-ended LVCMOS / LVTTTL clock input or a differential LVPECL or LVDS clock input pair. The maximum input frequency is 175MHz.

### PLL Operation

The M2004-02/-12 is a complete clock PLL. It uses a phase detector and configurable dividers to synchronize the output of the VCISO with the selected reference clock.

The “M Divider” divides the VCISO output frequency, feeding the result into the phase detector. The selected input reference clock is fed into the other input of the phase detector. The phase detector compares its two inputs. It then causes the VCISO to increase or decrease in speed as needed to phase- and frequency-lock the VCISO to the reference input.

---

*The value of M directly affects closed loop bandwidth.*

---

### The M Divider

The relationship between the VCISO center frequency (Fvcso), the M divider, and the input reference frequency (Fref\_clk) is:

$$F_{vcso} = F_{ref\_clk} \times M$$

The product of M and the input frequency must be such that it falls within the “lock” range of the VCISO.

---

*See APR in AC Characteristics on pg. 7.*

---

### N Divider and Outputs

The M2004-02/-12 provides one differential LVPECL output pair: FOUT, nFOUT. By using the N divider, the output frequency can be the VCISO center frequency (Fvcso) or 1/2, 1/4, or 1/8 Fvcso.

---

*See Table 5, N Divider Pin Selection, on pg. 3.*

---

When the N divider is included, the complete relationship for the output frequency (Fout) is defined as:

$$F_{out} = \frac{F_{vcso}}{N} = F_{ref\_clk} \times \frac{M}{N}$$

### Configuration of M and N Dividers

The M and N dividers can be set by pin configuration using the input pins M0 - M5, N0, and N1.

The data on pins M5:0 and pins N1:0 is passed directly to the M and N dividers.

The divider configuration of the M2004-02/-12 is reset when the input pin MR is set HIGH. MR is set LOW for divider configuration to be operational.

### Hitless Switching and Phase Build-out \*

A proprietary automatic Hitless Switching (HS) function is included in the M2004-12. The HS function provides SONET/SDH MTIE and TDEV compliance during a reference clock reselection using the internal mux or when using an external mux (through detection of the resulting phase transient).\*\* A Phase Build-out (PBO) function is also incorporated to absorb most of the phase change in the reference clock input.

The combined HS/PBO function is armed after the device locks to the input clock reference. Once armed, HS/PBO is triggered by either:

- Changing REF\_SEL to switch the input reference clock.
- Detection at the phase detector of an input phase transient beyond 4 ns.

Once triggered, the HS function narrows loop bandwidth to control MTIE during locking to the new input phase. With proper configuration of the external loop filter, the output clocks will comply with MTIE and TDEV specifications for GR-253 (SONET) and ITU G.813 (SDH) during input reference clock changes.

The Phase Build-out (PBO) function enables the PLL to absorb most of the phase change of the input clock. The PBO function selects a new VCISO clock edge for the phase detector feedback clock, selecting the edge closest in phase to the new input clock phase. This reduces re-lock time, the generation of wander, and extra output clock cycles.

Note \*: The M2004-02 does not include HS/PBO.

Note \*\*: Transient-triggered HS/PBO is not suitable for use with an unstable reference clock that would induce phase jitter beyond 2 ns at the phase detector (e.g., Stratum DPPLL clock sources and unstable recovered network clocks intended for loop timing configuration). Therefore, the M2004-12 also offers the internal mux-triggered HS/PBO capability.

When the PLL locks to within 2 ns of the input clock phase, the PLL returns to normal loop bandwidth and the HS/PBO function is re-armed.

### External Loop Filter

To provide stable PLL operation, and thereby a low jitter output clock, the M2004-02/-12 requires the use of an external loop filter components. These are connected to the provided filter pins (see Figure 4). Due to the differential signal path design, the implementation consists of two identical complementary RC filters as shown in Figure 4, below.

Figure 4: External Loop Filter

PLL bandwidth is affected by the “M” value as well as the VCISO frequency. See Table 6, External Loop Filter Component Values M2004-02/-12, on pg. 5.

### PLL Simulator Tool Available

A free PC software utility is available on the ICS website ([www.icst.com](http://www.icst.com)). The M2000 Timing Modules PLL Simulator is a downloadable application that simulates PLL jitter and wander transfer characteristics. This enables the user to set appropriate external loop component values in a given application.

### External Loop Filter Component Values <sup>1</sup> M2004-02/-12

VCISO Parameters:  $K_{VCO} = 800\text{kHz/V}$ ,  $R_{IN} = 16\text{k}\Omega$ , VCISO Bandwidth = 700kHz. See AC Characteristics on pg. 7 for PLL Loop Constants.

Device Configuration			Example External Loop Filter Component Values				Nominal Performance Using These Values		
F <sub>Ref</sub> (MHz)	F <sub>VCISO</sub> (MHz)	M Divider Value	R loop	C loop	R post	C post	PLL Loop Bandwidth	Damping Factor	Passband Peaking (dB)
19.44	622.08	32	13kΩ	0.47μF	33kΩ	220pF	3.8kHz	5.6	0.06
19.44	622.08	32	39kΩ	0.022μF	20kΩ	220pF	12.7kHz	7.7	0.03
19.44	622.08	32	2.2kΩ	10.0μF	22kΩ	3300pF	710Hz	4.4	0.10
155.52	622.08	4	3.9kΩ	0.47μF	39kΩ	100pF	11.0kHz	4.7	0.09
155.52	622.08	4	750Ω	10.0μF	7.5kΩ	1000pF	1.6kHz	4.2	0.10

Table 6: External Loop Filter Component Values M2004-02/-12

Note 1:  $K_{VCO}$ , VCISO Bandwidth, M Divider Value, and External Loop Filter Component Values determine Loop Bandwidth, Damping Factor, and Passband Peaking. For PLL Simulator software, go to [www.icst.com](http://www.icst.com).

## ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

Symbol	Parameter	Rating	Unit
V <sub>I</sub>	Inputs	-0.5 to V <sub>CC</sub> +0.5	V
V <sub>O</sub>	Outputs	-0.5 to V <sub>CC</sub> +0.5	V
V <sub>CC</sub>	Power Supply Voltage	4.6	V
T <sub>S</sub>	Storage Temperature	-45 to +100	°C

Table 7: Absolute Maximum Ratings

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in Recommended Conditions of Operation, DC Characteristics, or AC Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

## RECOMMENDED CONDITIONS OF OPERATION

### Output Duty Cycle

Figure 7: Output Duty Cycle

### AC Coupled LVPECL Output Circuit for 45-55% Duty Cycle at Fvco

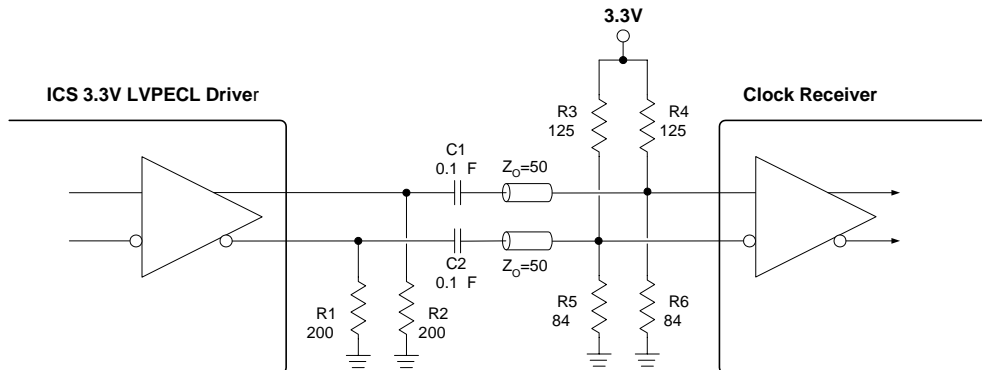

Figure 8: AC Coupled Output

AC coupled termination can be used with the M2004-02/-12 LVPECL output, as shown above in Figure 8, to achieve an improved output duty cycle of 45-55% or better at the load when N=1 (output N Divider). This performance has been characterized when R1 = R2 = 200Ω, C1 = C2 = 0.1μF, and when termination resistance at the receiver (combination of R3 with R5, and R4 with R6) is 50 ohms.
