## 1A CMOS Low-Dropout Voltage Regulator

The NCP694 series of fixed output super low dropout linear regulators are designed for portable battery powered applications with high output current requirement up to 1 A and  $-3$  mV typical load regulation at 1 A. Each device contains a voltage reference unit, an error amplifier, a PMOS power transistor, resistors for setting output voltage, a current limit circuits for overcurrent and thermal-shutdown. A standby mode with ultra low supply current can be realized with the chip enable function.

The device is housed in the SOT-89-5 and HSON-6 packages. Standard voltage versions are 0.8 V, 1.0 V, 1.2 V, 2.5 V, 3.3 V for fixed version and adjustable output voltage down to 1.0 V.

### Features

- Maximum Operating Voltage of 6.0 V
- Minimum Output Voltage Down to 0.8 V for Fix Version and 1.0 V for Adjustable Version
- Load Regulation  $-3$  mV at 1 A Output Current
- Low Dropout
- Build-in Auto Discharge Function for D Version
- Standby Mode With Low Consumption
- These are Pb-Free Devices

### Typical Applications

- Battery Powered Instruments
- Hand-Held Instruments
- Camcorders and Cameras
- Portable communication equipments

## PIN FUNCTION DESCRIPTION FOR SOT-89-5 PACKAGE

Pin No.	Pin Name	Description
1	ADJ/NC	Adjust pin for NCP694DADJHT1G and NCP694HADJHT1G / No connection
2	GND	Power supply ground
3	CE	This input is used to place the device into low-power standby. When this input is pulled low, the device is disabled. If this function is not used, Enable should be connected to $V_{in}$ .
4	$V_{in}$	Positive power supply input voltage.
5	$V_{out}$	Regulated output voltage.

## PIN FUNCTION DESCRIPTION FOR HSON-6 PACKAGE

Pin No.	Pin Name	Description
1	$V_{out}$	Regulated output voltage
2	$V_{out}$	Regulated output voltage
3	ADJ / NC	Adjust pin for NCP694DSANADJT1G and NCP694HSANADJT1G / No connection
4	GND	Power supply ground
5	CE	This input is used to place the device into low power standby. When this input is pulled low, the device is disabled. If this function is not used, Enable should be connected to $V_{in}$ .
6	$V_{in}$	Positive power supply input voltage

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage	$V_{in}$	6.5	V
Enable Voltage	$V_{CE}$	-0.3 to $V_{in}$	V
Output Voltage	$V_{out}$	-0.3 to $V_{in} + 0.3$	V
Power Dissipation SOT-89-5	$P_D$	900	mW
Power Dissipation HSON-6	$P_D$	900	mW
Operating Junction Temperature	$T_J$	+150	°C
Operating Ambient Temperature	$T_A$	-40 to +85	°C
Storage Temperature	$T_{stg}$	-55 to +125	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. This device series contains ESD protection and exceeds the following tests:  
Human Body Model 2000 V per JEDEC  
Machine Model Method 200 V

## THERMAL CHARACTERISTICS

Rating	Symbol	Test Conditions	Typical Value	Unit

APPLICATIONS INFORMATION

A typical application circuit for the NCP694 series is shown in Figure 5, Typical Application Schematic.

**Input Decoupling (C1)**

A 4.7  $\mu\text{F}$  capacitor either ceramic or tantalum is recommended and should be connected as close as possible to the pins of NCP694 device. Higher values and lower ESR will improve the overall line transient response.

**Output Decoupling (C2)**

The minimum decoupling value is 4.7  $\mu\text{F}$  and can be augmented to fulfill stringent load transient requirements. The regulator accepts ceramic chip capacitors as well as tantalum devices. If a tantalum capacitor is used, and its ESR is large, the loop oscillation may result. Because of this, select C2 carefully considering its frequency characteristics. Larger values improve noise rejection and load regulation transient response.

**Enable Operation**

The enable pin CE will turn on or off the regulator. These limits of threshold are covered in the electrical specification section of this data sheet. If the enable is not used then the pin should be connected to  $V_{in}$ . The D version devices (NCP694DxxxxT1G) have additional circuitry in order to reach the turn-off speed faster than normal type. When the mode is into standby with CE signal, auto discharge transistor turns on.

**Hints**

Please be sure the  $V_{in}$  and GND lines are sufficiently wide. If their impedance is high, noise pickup or unstable operation may result.

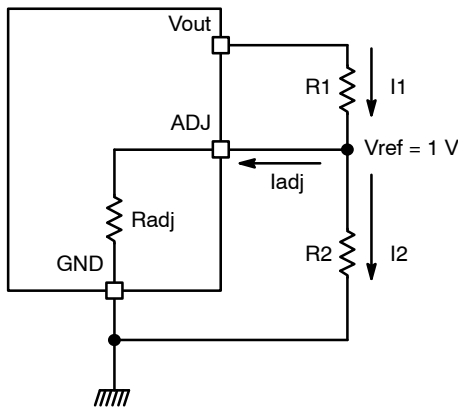

Figure 3. Output Voltage Setting

Set external components, especially the output capacitor, as close as possible to the circuit, and make leads as short as possible.

**Thermal**

As power across the NCP694 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature effect the rate of temperature rise for the part. This is stating that when the NCP694 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

**Output Voltage Setting of Adjustable Version.**

An external two resistors are required for setting desired output voltage as shows Figure 3. Output Voltage Setting. The equation for the output voltage is mentioned in equation below.

$$\begin{aligned}
 V_{out} &= V_{ref} + R1 \cdot I1 \\
 &= V_{ref} + R1 \cdot (I_{adj} + I2) \\
 &= V_{ref} + R1 \cdot (V_{ref}/R_{adj}) + R1 \cdot (V_{ref}/R2) \quad (\text{eq. 1}) \\
 &= V_{ref} \cdot \left( 1 + (R1/R_{adj}) + (R1/R2) \right) \\
 &= 1.0 \cdot \left( 1 + (R1/R_{adj}) + (R1/R2) \right)
 \end{aligned}$$

For better accuracy, choosing  $R2 \ll R_{adj}$  reduces the error given by ADJ pin consumption. The typical resistance  $R_{adj}$  is showed in Figure 4. ADJ Pin Resistance
