

**THE DATASHEET OF
PT7M6315US29D1TBEX**

Description

The series is designed to monitor power supplies in μ P and digital systems. It provides excellent circuit reliability and low cost by eliminating external components and adjustments, and a debounced manual reset input.

This device performs a single function: it asserts a reset signal whenever the V_{CC} supply voltage falls below a preset threshold or whenever manual reset is asserted. Reset remains asserted for an internally programmed interval (reset timeout period) after V_{CC} has risen above the reset threshold or manual reset is deasserted.

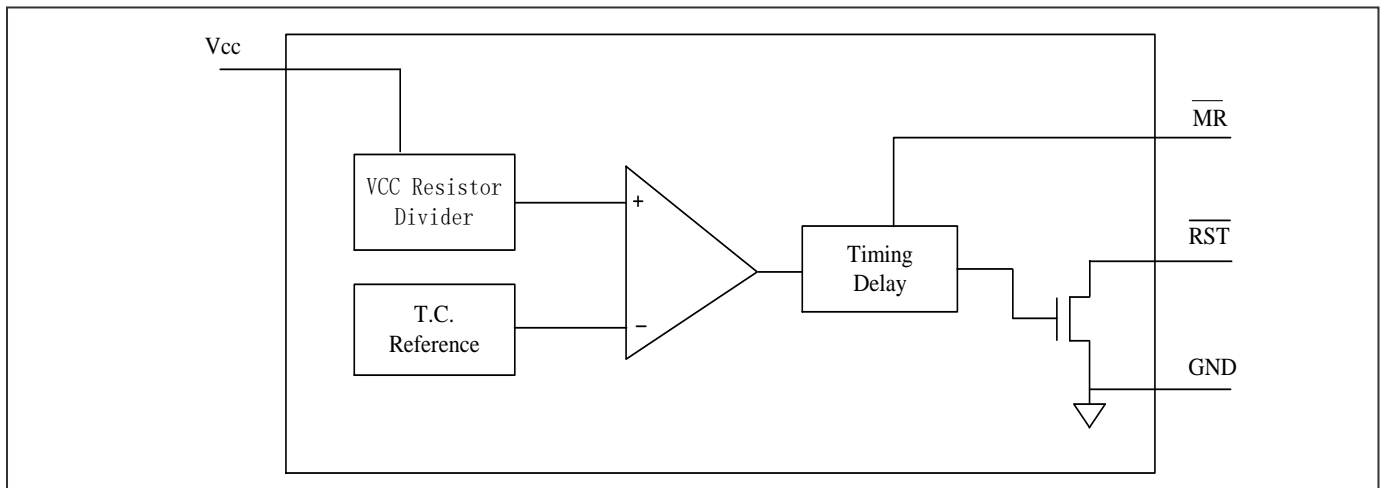

The DIODES PT7M6315USxx devices are open-drain RESET output. They can be pulled up to a voltage higher than V_{CC} .

The serials come with factory-trimmed, reset threshold voltages in 100mV increments from 1.8V to 5V. Preset timeout periods of 200ms (typ.) for PT7M6315USxxD3, 1570ms (typical) for PT7M6315USxxD4, and 26ms for PT7M6315USxxD2 are available.

Pin Configuration

Pin Description

Name	Type	Description
$\overline{\text{RST}}$	I/O	Reset Output: $\overline{\text{RST}}$ is asserted when V_{CC} drops below voltage threshold V_{TH} . Active low.
$\overline{\text{MR}}$	I	Manual Reset: A logic low on $\overline{\text{MR}}$ asserts reset. Reset remains asserted as long as $\overline{\text{MR}}$ is low, and for the reset timeout period (t_{RS}) after the reset conditions are terminated. Connect to V_{CC} if not used.
GND	P	Ground
V_{CC}	P	Supply Voltage.

Function Description

Power Monitor

A microprocessor's (μP) reset input starts the μP in a known state. Whenever the μP is in an unknown state, it should be held in reset. The supervisory circuits assert reset during power-up and prevent code execution errors during power down or brownout conditions.

On power up, once V_{CC} reaches about 1.0V, $\overline{\text{RST}}$ is a guaranteed logic low of 0.4V or less. As V_{CC} rises, $\overline{\text{RST}}$ stays low. When V_{CC} rises above the reset threshold V_{RST} , an internal timer releases $\overline{\text{RST}}$ after about 200ms (PT7M6315USxxD3) or 1570ms (PT7M6315USxxD4) or 26ms (PT7M6315USxxD2) or 1.6ms (PT7M6315USxxD1). $\overline{\text{RST}}$ asserts whenever V_{CC} drops below the reset threshold, i.e. brownout condition. If brownout occurs in the middle of a previously initiated reset pulse, the pulse continues for at least another 200ms (PT7M6315USxxD3) or 1570ms (PT7M6315USxxD4) or 26ms (PT7M6315USxxD2) or 1.6ms (PT7M6315USxxD1). On power down, once V_{CC} falls below the reset threshold, $\overline{\text{RST}}$ stays low and is guaranteed to be 0.4V or less until V_{CC} drops below 1V.

Manual Reset

The manual-reset input ($\overline{\text{MR}}$) allows reset to be triggered by a push button switch. The switch is effectively debounced by the 1.6ms (PT7M6315USxxD1) or 26ms (PT7M6315USxxD2) or 200ms (PT7M6315USxxD3) or 1570ms (PT7M6315USxxD4) reset pulse width.
