KEA128 Sub-Family Data Sheet Supports the following: S9KEAZ64AMLK(R), S9KEAZ128AMLK(R), S9KEAZ64AVLK(R), S9KEAZ128AVLK(R), S9KEAZ64ACLK(R), S9KEAZ128ACLK(R), S9KEAZ64AMLH(R), S9KEAZ128AMLH(R), S9KEAZ64AVLH(R), S9KEAZ128AVLH(R), S9KEAZ64ACLH(R) and S9KEAZ128ACLH(R)

Rev. 6 — 30 January 2024 **Data sheet**

1 Key features

1.1 Operating characteristics

- Voltage range: 2.7 to 5.5 V
- Flash write voltage range: 2.7 to 5.5 V
- Temperature range (ambient): -40 to 125°C

1.2 Performance

- Up to 48 MHz Arm® Cortex-M0+ core
- Single cycle 32-bit x 32-bit multiplier
- Single cycle I/O access port

1.3 Memories and memory interfaces

- Up to 128 KB flash
- Up to 16 KB RAM

1.4 Clocks

- Oscillator (OSC) - supports 32.768 kHz crystal or 4 MHz to 24 MHz crystal or ceramic resonator; choice of low power or high gain oscillators
- Internal clock source (ICS) - internal FLL with internal or external reference, 37.5 kHz pre-trimmed internal reference for 48 MHz system clock
- Internal 1 kHz low-power oscillator (LPO)

1.5 System peripherals

- Power management module (PMC) with three power modes: Run, Wait, Stop
- Low-voltage detection (LVD) with reset or interrupt, selectable trip points
- Watchdog with independent clock source (WDOG)
- Programmable cyclic redundancy check module (CRC)
- Serial wire debug interface (SWD)
- Aliased SRAM bitband region (BIT-BAND)
- Bit manipulation engine (BME)

1.6 Security and integrity modules

- 80-bit unique identification (ID) number per chip

1.7 Human-machine interface

- Up to 71 general-purpose input/output (GPIO)
- Two 32-bit keyboard interrupt modules (KBI)
- External interrupt (IRQ)

1.8 Analog modules

- One up to 16-channel 12-bit SAR ADC, operation in Stop mode, optional hardware trigger (ADC)
- Two analog comparators containing a 6-bit DAC and programmable reference input (ACMP)

1.9 Timers

- One 6-channel FlexTimer/PWM (FTM)
- Two 2-channel FlexTimer/PWM (FTM)
- One 2-channel periodic interrupt timer (PIT)
- One pulse width timer (PWT)
- One real-time clock (RTC)

1.10 Communication interfaces

- Two SPI modules (SPI)
- Up to three UART modules (UART)
- Two I2C modules (I2C)
- One MSCAN module (MSCAN)

1.11 Package options

- 80-pin LQFP
- 64-pin LQFP

2 Ordering parts

2.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to **nxp.com** and perform a part number search for the following device numbers: KEAZ128 .

3 Part identification

3.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

3.2 Format)

Part numbers for this device have the following format:

Q B KEA A C FFF M T PP N

3.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Field	Description	Values
Q	Qualification status	• S = Automotive qualified • P = Prequalification
B	Memory type	• 9 = Flash
KEA	Kinetis Auto family	• KEA
A	Key attribute	• Z = M0+ core • F = M4 W/ DSP & FPU • C= M4 W/ AP + FPU
C	CAN availability	• N = CAN not available • (Blank) = CAN available
FFF	Program flash memory size	• 128 = 128 KB
M	Maskset identifier	• A = TSMC10 Mask Rev2 • W0 = TSMC11 Mask Rev0 • B = TSMC10 Mask Rev2 or TSMC11 Mask Rev0
T	Temperature range (°C)	• C = –40 to 85 • V= –40 to 105 • M = –40 to 125
PP	Package identifier	• LH = 64 LQFP (10 mm x 10 mm) • LK = 80 LQFP (14 mm x 14 mm)
N	Packaging type	• R = Tape and reel • (Blank) = Trays

3.4 Example

This is an example part number:

S9KEAZ128AMLK

4 Ratings

4.1 Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
T_{STG}	Storage temperature	–55	150	°C	[1]
T_{SDR}	Solder temperature, lead-free	—	260	°C	[2]

[1] Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
[2] Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.2 Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	[1]

[1] Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.3 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
V_{HBM}	Electrostatic discharge voltage, human body model	–6000	+6000	V	[1]
V_{CDM}	Electrostatic discharge voltage, charged-device model	–500	+500	V	[2]
I_{LAT}	Latch-up current at ambient temperature of °C	–100	+100	mA	[3]

[1] Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
[2] Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
[3] Determined according to JEDEC Standard JESD78D, *IC Latch-up Test*. The test produced the following results:
- Test was performed at 125 °C case temperature (Class II).
- I/O pins pass +100/-100 mA I-test with I_{DD} current limit at 400 mA (V_{DD} collapsed during positive injection).
- I/O pins pass +50/-100 mA I-test with I_{DD} current limit at 1000 mA for V_{DD}.
- Supply groups pass 1.5 V_{ccmax}.
- RESET_B pin was only tested with negative I-test due to product conditioning requirement.

4.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}) or the programmable pullup resistor associated with the pin is enabled.

Table 1. Voltage and current operating ratings

Symbol	Description	Min.	Max.	Unit
V_{DD}	Digital supply voltage	–0.3	6.0	V
I_{DD}	Maximum current into V_{DD}	—	120	mA
V_{IN}	Input voltage except true open drain pins	–0.3	V_{DD} + 0.3[1]	V
	Input voltage of true open drain pins	–0.3	6	V
I_D	Instantaneous maximum current single pin limit (applies to all port pins)	–25	25	mA
V_{DDA}	Analog supply voltage	V_{DD} – 0.3	V_{DD} + 0.3	V

[1] Maximum rating of V_{DD} also applies to V_{IN}.

$\|I_{INTOT}\|$	Total leakage combined for all port pins	Pins in high impedance input mode	V_{IN} = V_{DD} or V_{SS}	—	—	2	µA

Table 2. DC characteristics*...continued*

Symbol	Descriptions			Min	Typical[1]	Max	Unit
R_{PU}	Pullup resistors	All digital inputs, when enabled (all I/O pins other than PTA2 and PTA3)	—	30.0	—	50.0	kΩ
R_{PU} [4]	Pullup resistors	PTA2 and PTA3 pins	—	30.0	—	60.0	kΩ
I_{IC}	DC injection current[5][6][7]	Single pin limit	$V_{IN} < V_{SS}$, $V_{IN} > V_{DD}$	-2	—	2	mA
		Total MCU limit, includes sum of all stressed pins		-5	—	25	
C_{In}	Input capacitance, all pins		—	—	—	7	pF
V_{RAM}	RAM retention voltage		—	2.0	—	—	V

[1] Typical values are measured at 25 °C. Characterized, not tested.
[2] Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
[3] Only PTB4, PTB5, PTD0, PTD1, PTE0, PTE1, PTH0, and PTH1 support high current output.
[4] The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
[5] All functional non-supply pins, except for PTA2 and PTA3, are internally clamped to V_{SS} and V_{DD}. PTA2 and PTA3 are true open drain I/O pins that are internally clamped to V_{SS}.
[6] Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger value.
[7] Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If the positive injection current ($V_{In} > V_{DD}$) is higher than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure that external V_{DD} load will shunt current higher than maximum injection current when the MCU is not consuming power, such as when no system clock is present, or clock rate is very low (which would reduce overall power consumption).

5.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation play a significant role in EMC performance. The system designer must consult the following NXP applications notes, available on nxp.com for advice and guidance specifically targeted at optimizing EMC performance.

- AN2321: Designing for Board Level Electromagnetic Compatibility
- AN1050: Designing for Electromagnetic Compatibility (EMC) with HCMOS Microcontrollers
- AN1263: Designing for Electromagnetic Compatibility with Single-Chip Microcontrollers
- AN2764: Improving the Transient Immunity Performance of Microcontroller-Based Applications

5.3 Thermal specifications

5.3.1 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 7. Thermal attributes

Board type	Symbol	Description	64 LQFP	80 LQFP	Unit	Notes
Single-layer (1S)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	71	57	°C/W	[1], [2]
Four-layer (2s2p)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	53	44	°C/W	[1], [3]
Single-layer (1S)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	59	47	°C/W	[1], [3]
Four-layer (2s2p)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	46	38	°C/W	[1], [3]
—	$R_{\theta JB}$	Thermal resistance, junction to board	35	28	°C/W	[4]
—	$R_{\theta JC}$	Thermal resistance, junction to case	20	15	°C/W	[5]
—	Ψ_{JT}	Thermal characterization parameter, junction to package top outside center (natural convection)	5	3	°C/W	[6]

[1] Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
[2] Per JEDEC JESD51-2 with the single layer board (JESD51-3) horizontal.
[3] Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
[4] Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
[5] Thermal resistance between the die and the solder pad on the bottom of the package. Interface resistance is ignored.
[6] Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization.

The average chip-junction temperature (T_J) in °C can be obtained from:

$T_J = T_A + (P_D \times \theta_{JA})$

Where:

T_A = Ambient temperature, °C

θJA = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$, Watts - chip internal power

$P_{I/O}$ = Power dissipation on input and output pins - user determined

For most applications, $P_{I/O} << P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$P_D = K \div (T_J + 273\ °C)$

Solving the equations above for K gives:

$K = P_D \times (T_A + 273\ °C) + \theta_{JA} \times (P_D)^2$

where K is a constant pertaining to the particular part. K can be determined by measuring P_D (at equilibrium) for an known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving the above equations iteratively for any value of T_A.

[1] Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
[2] See crystal or resonator manufacturer's recommendation.
[3] Load capacitors (C_1,C_2), feedback resistor (R_F) and series resistor (R_S) are incorporated internally when RANGE = HGO = 0.
[4] This parameter is characterized and not tested on each device.
[5] Proper PC board layout procedures must be followed to achieve specifications.
[6] This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
[7] Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{Bus}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

6.5 Communication interfaces

6.5.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown with respect to 20% V_{DD} and 80% V_{DD}, unless noted, and 25 pF load on all SPI pins. All timing assumes slew rate control is disabled and high-drive strength is enabled for SPI output pins.

10 Legal information

10.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

10.2 Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

10.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Suitability for use in automotive applications — This NXP product has been qualified for use in automotive applications. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as “Critical Applications”), then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys’ fees) that NXP may incur related to customer’s incorporation of any product in a Critical Application.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security- Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer’s applications and products. Customer’s responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer’s applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
